Facial Expression Recognition for Security

Mrs. Ayesha Butalia, Dr. Maya Ingle, Dr. Parag Kulkarni

Abstract: Facial expressions play an important role in interpersonal relations as well as for security purposes. The malicious intentions of a thief can be recognized with the help of his gestures, facial expressions being its major part. This is because humans demonstrate and convey a lot of evident information visually rather than verbally. Although humans recognize facial expressions virtually without effort or delay, reliable expression recognition by machine remains a challenge.

A picture portrays much more than its equivalent textual description. Along this theory, we assert that although verbal and gestural methods convey valuable information, facial expressions are unparalleled in this regard.

In sustenance to this idea, a facial expression is considered to consist of deformations of facial components and their spatial relations, along with changes in the pigmentation of the same. This paper envisages the detection of faces, localization of features thus leading to emotion recognition in images.

Key Terms: Facial Gestures, Action Units, Neural Networks, Fiducial Points, Feature Contours.

INTRODUCTION

Facial expression recognition is a basic process performed by every human every day. Each one of us analyses the expressions of the individuals we interact with, to understand best their response to us. The malicious intentions of a thief or a person to be interviewed can be recognized with the help of his gestures, facial expressions being its major part. In this paper we have tried to highlight the facial expressions for security reasons.

In the next step to Human-Computer interaction, we endeavor to empower the computer with this ability — to be able to discern the emotions depicted on a person's visage. This seemingly effortless task for us needs to be broken down into several parts for a computer to perform. For this purpose, we consider a facial expression to represent fundamentally, a deformation of the original features of the face.

On a day-to-day basis, humans commonly recognize emotions by characteristic features displayed as part of a facial expression. For instance, happiness is undeniably associated with a smile, or an upward movement of the corners of the lips. This could be accompanied by upward movement of the cheeks and wrinkles directed outward from the outer corners of the eyes. Similarly, other emotions are characterized by other deformations typical to the particular expression.

More often than not, emotions are depicted by subtle changes in some facial elements rather than their obvious contortion to represent its typical expression as is defined. In order to detect these slight variations induced, it is important to track fine-grained changes in the facial features.

The general trend of comprehending observable components of facial gestures utilizes the FACS, which is also a commonly used psychological approach. This system, as described by Ekman^[12], interprets facial information in terms of *Action Units*, which isolate localized changes in features such as eyes, lips, eyebrows and cheeks.

The actual process is akin to a divide-and-conquer approach, a step-by-step isolation of facial features, and then recombination of the interpretations of the same in order to finally arrive at a conclusion about the emotion depicted.

RELATED WORK

Visually conveyed information is probably the most important communication mechanism used for centuries, and even today. As mentioned by Mehrabian^[8], upto 55% of the communicative message is understood through facial expressions. This understanding has sparked an enormous amount of speculation in the field of facial gestural analysis over the past couple of decades. Many different techniques and approaches have been proposed and implemented in order to simplify the way computers comprehend and interact with their users.

The need for faster and more intuitive Human-Computer Interfaces is ever increasing with many new innovations coming to the forefront.^[1]

Azcarate et al.^[11] used the concept of *Motion Units* (MUs) as input to a set of classifiers in their solution to the facial emotion recognition problem. Their concept of MUs is similar to "Action Units" as described by Ekman.^[12] Chibelushi and Bourel^[3] propose the use of GMM (Gaussian Mixture Model) for pre-processing and HMM (Hidden Markov Model) with Neural Networks for AU identification.

Lajevardi and Hussain^[15] suggest the idea of dynamically selecting a suitable subset of Gabor filters from the available 20 (called Adaptive Filter Selection), depending on the kind of noise present. Gabor Filters have also been used by Patil et al.^[16]. Lucey et al.^[17] have devised a method to detect expressions invariant of registration using Active Appearance Models (AAM). Along with multi-class SVMs, they have used this method to identify expressions that are more generalized and independent of image processing constraints such as pose and illumination.

Noteworthy is the work of Theo Gevers et al.^[21] in this field. Their facial expression recognition approach enhances the AAMs mentioned above, as well as MUs. Tree-augmented Bayesian Networks (TAN), Native Bayes (NB) Classifiers and Stochastic Structure Search (SSS) algorithms are used to effectively classify motion detected in the facial structure dynamically.

Similar to the approach adopted in our system, P. Li et al have utilized *fiducial points* to measure feature deviations and OpenCV detectors for face and feature detection.

Moreover, their geometric face model orientation is akin to our approach of polar transformations for processing faces rotated within the same plane (i.e. for tilted heads).

SYSTEM ARCHITECTURE

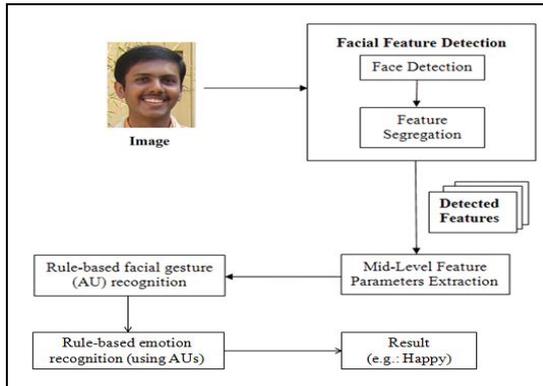

Fig. 1: Block Diagram of the Facial Recognition System

The task of automatic facial expression recognition from face image sequences is divided into the following sub-problem areas: detecting prominent facial features such as eyes and mouth, representing subtle changes in facial expression as a set of suitable midlevel feature parameters, and interpreting this data in terms of facial gestures.

As described by Chibelushi and Bourel^[3], facial expression recognition shares a generic structure similar to that of facial recognition. While facial recognition requires that the face be independent of deformations in order to identify the individual correctly, facial expression recognition measures deformations in the facial features to classify them. Although the face and feature detection stages are shared by these techniques, their eventual aim is different.

Face detection is widely applied through the HSV segmentation technique. This step narrows the region of interest of the image down to the facial region, eliminating unnecessary information for faster processing.

Analyzing this region (facial) helps in locating the predominant seven regions of interest (ROIs), viz. two eyebrows, two eyes, nose, mouth and chin. Each of these regions is then filtered to obtain the desired facial features. Following up this step, to spatially sample the contour of a certain permanent facial feature, one or more facial-feature detectors are applied to the pertinent ROI. For example, the contours of the eyes are localized in the ROIs of the eyes by using a single detector representing an adapted version of a hierarchical-perception feature location method^[13]. We have performed feature extraction by a method that extracts features based on Haar-like features, and classifies them using a tree-like decision structure. This is similar to the process described by Borsboom et. al^[7].

The contours of the facial features, generated by the facial feature detection method, are utilized for further analysis of shown facial expressions. Similar to the approach taken by Pantic and Rothkrantz^[2], we carry out feature points' extraction under the assumption that the face images are non-occluded and in frontal view. We extract 22 fiducial points, which constitute the action units, once grouped by the ROI they belong to. The last stage

employs the FACS, which is still the most widely used method to classify facial deformations.

The output of the above stage is a set of detected action units. Each emotion is the equivalent of a unique set of action units, represented as rules in first-order logic. These rules are utilized to interpret the most probable emotion depicted by the subject.

The rules can be described in first-order predicate logic or propositional logic in the form:

Gesture (surprise):- **eyebrows** (raised) ^ **eyes** (wide-open) ^ **mouth** (open).

For instance, the following diagram shows all the fiducial points marked on the human face. And for a particular emotion, a combination of points are affected and monitored. Like for surprise, the following action units are considered:

- Opening of mouth indicated by pt 19 and pt 18
- Widening of eyes shown by pt 13, pt14, pt 9 and pt 10.
- Raised eyebrows using pt 2 and pt 5

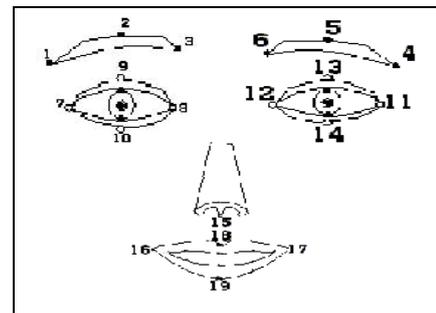

Fig. 2: Facial Points used for the distances definition^[13]

Both face and feature localization are challenging because of the face/features manifold owing to the high inter-personal variability (e.g. gender and race), the intrapersonal changes (e.g. pose, expression, presence/absence of glasses, beard, mustaches), and the acquisition conditions (e.g. illumination and image resolution).

Artificial Neural Networks and Fuzzy Sets

We observed that other applications used an ANN^[13] with one hidden layer^[1] to implement recognition of gestures for a single facial feature (lips) alone. Hence it is but obvious that one such ANN will be necessary for each independent feature or *Action Unit* that will be interpreted for emotion analysis. We intend to utilize the concept of Neural Networks to assist the system to learn (in a semi-supervised manner) how to customize its recognition of expressions for different specialized cases or environments.

Fuzzy logic^[22] (and fuzzy sets) is a form of multi-valued logic derived from fuzzy set theory to deal with reasoning that is approximate rather than accurate. Pertaining to facial expressions, fuzzy logic comes into picture when a certain degree of deviation is to be made permissible from the expected set of values for a particular facial expression.

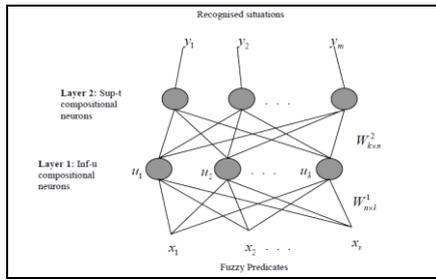

Fig. 3: The Two-Layer Neurofuzzy Architecture ^[13]

This is necessary because each person's facial muscles contort in slightly different ways while showing similar emotions. Thus the deviated features may have slightly different coordinates, yet still the algorithm should work irrespective of these minor differences. Fuzzy logic is used to increase the success rate of the process of recognition of facial expressions across different people. A neuro-fuzzy architecture incorporates both the techniques, merging known values and rules with variable conditions, as shown in Fig. 3. Chatterjee and Shi ^[18] have also utilized the neuro-fuzzy concept to classify expressions, as well as to assign weights to facial features depending on their importance to the emotion detection process.

POTENTIAL ISSUES

Geographical Versatility

One of the fundamental problems faced by any software that accepts images of the user as an input is that it needs to account for the geographical variations bound to occur in it. Though people coming from one geographical area share certain physiological similarities, they tend to be distinct from those who belong to another region. However, these physical differences will create a lot of inconsistencies in the input obtained.

To tackle this issue, the software must employ a technique that helps increase the scale of deviations occurring, so that divergence to a certain degree can be rounded off and the corresponding feature recognized. Support Vector Machines ^[10] help the software do this.

Fundamentally, a set of SVMs will be used to specify and incorporate rules for each facial feature and related possible gestures. The more the rules for a particular feature, the greater will be the degree of accuracy for even the smallest of micro-expressions and for the greater resolution images.

Originally designed for binary classification, there are currently two types of approaches ^[10] for multi-class SVMs. The first approach is to construct and combine several binary classifiers (also called "one-per-class" method) while the other is to consider all data in one optimization formulation named one-one way. Also, SVMs can be used to form slightly customized rules for drastically different geographical populations. Once the nativity of the subject is identified, the appropriate multi-class SVM can be used for further analysis and processing.

Thus, this method uses SVMs to take care of the differences and inconsistencies due to the environmental variations.

Personalization and Calibration

The process of emotion detection can be further enhanced to train the system using semi-supervised learning. Since past data about a particular subject's emotive expression can be stored and be made available to the system later, it may serve to improve the machines 'understanding' and be used as a base for inferring more about a person's emotional state from a more experienced perspective.

One approach to supervised learning is on inception of the system, for AU and gesture mapping. Here, the user will give feedback to the system with respect to his/her images flashed on the screen in the form of gesture name. This calibration process may be allowed approximately a minute or two to complete. In this way the user is effectively tutoring the system to recognize basic gestures so that it can build up on this knowledge in a semi-supervised manner later on. This feedback will be stored in a database along with related entries for the parameters extracted from the region of interest (ROI) of the image displayed. The same feedback is also fed into the neuro-fuzzy network structure which performs the translation of the input parameters to obtain the eventual result. It is used to shift the baseline for judging the input parameters and classifying them as part of the processing involved in the system. Now, for further input received, the neural network behaves in tandem with its new, personalized rule set.

The user can also request for training examples to be gathered at discrete time intervals and provide a label for each. This can be combined with the displacements output by the feature extraction phase and added as a new example to the training set. Another way to increase the personalized information is to maintain an active history of the user, similar to a session. This data is used further on to implement a context-based understanding of the user, and predict the likelihoods of emotions that may be felt in the near future.

Calibration and Personalization would further increase the recognition performance and allow a tradeoff between generality and precision to be made. By applying these methods, the system in focus will be able to recognize the user's facial gestures with very high accuracy; this approach is highly suitable for developing a personalized, user-specific application.

Dealing with Missing Values

The uncontrolled conditions of the real world and the numerous methods that can be employed to obtain the information for processing can cause extensive occlusions and create a vast scope for missing values in the input. Back in the history of linear PCA, the problem of missing values has long been considered as an essential issue and investigated in depth. ^{[24][25]} Thus in this paper the problem of missing values is tackled by taking into consideration the facial symmetry of the subject.

Though the human faces aren't exactly symmetrical for most expressions, we create perfectly symmetrical faces using the left or right (depending on which one is clearer) side of the face. Let's call it the reference image. The creation of the Reference image is shown below using the left and right sides of the face respectively.

Fig 4: Left: original face, Centre: Symmetrical face created using the right side, Right: Symmetrical face created using the left side.

Now the original image is first scanned for the occluded or blank areas in the face, that constitute the set of missing values. After all the locations of blockages have been identified, the Reference image is super-imposed on this scanned image. During the superimposition the facial symmetry is therefore utilized to complete the input values wherever necessary, and the missing values taken care of.

Overcoming Time Constraints

The main challenge in analyzing the face, for the expression being portrayed, is the amount of processing time required. This becomes a bottleneck in real time scenarios. One way of overcoming this time constraints is dividing the image into various regions of interest and analyzing each in parallel independently. For instance, the face can be divided into regions of the mouth; chin, eyes, eyebrows etc. and the parallel analysis of these can be combined to get the final result. This approach will guarantee a gain in the throughput of the system.

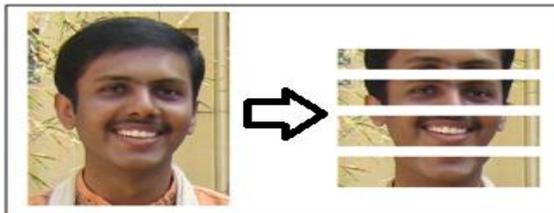

Fig. 5: Delegation of Image Components to Parallel Processors

RESULTS

In this section we present the resulting effectiveness of our systems facial expression recognition capability as well as subsequent emotion classification. The Confusion Matrix below shows that for a dataset of images depicting a particular emotion, how many were identified correctly, and how many were confused with other emotions. The dataset comprised images taken of an expert user, having knowledge of what a typical emotion is expected to show as per universal norms described by Ekman [12]. Our dataset comprised 60 images of Indian faces, with 15 each depicting Joy, Sorrow, Surprise and Neutral emotive states.

Total Accuracy: 71.7%

Table 1: Person-dependent Confusion Matrix for training and test data supplied by an expert user

Expression	Joy	Sorrow	Neutral	Surprise	Overall
Joy	11	1	1	2	73.3%
Sorrow	2	10	2	1	66.7%
Neural	3	2	10	0	66.7%
Surprise	2	0	1	12	80.0%

As is evident from Table 1, our system shows greater accuracy for Joy and Surprise with 73.3% and 80.0% accuracy rates respectively. The average accuracy of our system is 71.7%.

These results can be further improved by personalizing the system as discussed in the previous section. A personalized system is tuned to its user's specific facial actions, and hence, after a calibration period, can be expected to give an average accuracy of up to 90%.

FUTURE SCOPE AND APPLICATIONS

As human facial expression recognition is a very elementary process, it is useful to evaluate the mood or emotional state of a subject under observation. As such, tremendous potential lies untapped in this domain. The basic idea of a machine being able to comprehend the human emotive state can be put to use in innumerable scenarios, a few of which we have mentioned here.

- The ability to detect and track a user's state of mind has the potential to allow a computing system to offer relevant information when a user needs help – not just when the user requests help, for instance, the change in the Room Ambience by judging the mood of the person entering it.
- Help people in emotion-related research to improve the processing of emotion data.
- Applications in surveillance and security. For instance, computer models obtained up to 71% correct classification of innocent or guilty participants based on the macro features extracted from the video camera footage.
- In this regard, lie detection amongst criminal suspects during interrogation is also a useful aspect in which this system can form a base. It is proven that facial cues more often than not can give away a lie to the trained eye.
- Patient Monitoring in hospitals to judge the effectiveness of prescribed drugs is one application to the Health Sector. In addition to this, diagnosis of diseases that alter facial features and psychoanalysis of patient mental state are further possibilities.
- Clever Marketing is feasible using emotional knowledge of a patron and can be done to suit what a patron might be in need of based on his/her state of mind at any instant.
- Detecting symptoms such as drowsiness, fatigue, or even inebriation can be done using this system. Thus, by helping in the process of Driver Monitoring, this system can play an integral role in reducing road mishaps to a great extent.

Also noteworthy of mention is the advantage of reading emotions through facial cues, as our system does, over reading them through study of audio data of human voices. Not only does the probability of noise affecting and distorting the input reduce for our system, but also there are fewer ways to disguise or misread from visual information as opposed to audio data, as is also stated by Busso et. al [23]. Hence facial expressions would form a vital part of a multimodal system for emotion analysis as well.

CONCLUSION

As is quite evident after plenty of research and deliberation, gaining insight on what a person may be feeling is very valuable for many reasons. The future scope of this field is visualized to be practically limitless, with more futuristic applications visible on the horizon especially in the field of Security.

Our facial expression recognition system, utilizing neuro-fuzzy architecture is 71.7% accurate, which is approximately the level of accuracy expected from a support vector machine approach as well. Every system has its limitations. Although this particular implementation of facial expression recognition may perform less than entirely accurate as per the end users' expectations, it is envisioned to contribute significantly to the field, upon which similar work can be furthered and enhanced. Our aim in forming such a system is to form a standard protocol that may be used as a component in many of the applications that will no doubt require an emotion-based HCI.

Empowering computers in this way has the potential of changing the very way a machine "thinks". It gives them the ability to understand humans as 'feelers' rather than 'thinkers'. This in mind, this system can even be implemented in the context of Artificial Intelligence. As part of the relentless efforts of many to create intelligent machines, facial expressions and emotions have and always will play a vital role.

3d Heat Transfer Analysis and Numerical Modeling of LENSTM Process for One End Stepped Cylindrical Wall by Using Stainless Steel 304

Chirag P. Patel¹, Prof. R. I. Patel²

^{1,2}(Department Of Mechanical Engineering, Government Engineering College, Dahod/ GTU, India

Abstract : Laser Engineered Net Shaping (LENSTM) is a rapid-manufacturing process that involves complex thermal, mechanical, and metallurgical interactions. Due to process input parameter such as laser power, laser scanning velocity and feed rate, the effect on solidification of component to be produced must be understood. The finite element method (FEM) may be used to accurately model this process and solidification behavior by varying parameters. In this study the commercial FEM code ANSYS is used to predict the thermal histories, residual stresses, total deformation generated in One end stepped cylindrical wall and substrate of stainless steel 304. The computational results are compared with experimental measurements for validation.

Keywords: Laser engineering net shaping, FEM, Residual stresses, Total deformation, One end stepped Cylindrical wall, Element birth and death technique

I. Introduction

Laser Engineered Net Shaping (LENSTM) is a rapid manufacturing technology developed by Sandia National Laboratories (SNL) that combines features of powder injection and laser welding toward component fabrication. Several aspects of LENSTM are similar to those of single-step laser cladding. However, whereas laser cladding is primarily used to bond metallic coatings to the surfaces of parts that have already been produced with traditional methods^[1], LENSTM involves the complete fabrication of three-dimensional, solid metallic components through layer by layer deposition of melted powder metal. In this process, a laser beam is directed onto the surface of a metallic substrate to create a molten pool. Powder metal is then propelled by an inert gas, such as argon or nitrogen through converging nozzles into the molten pool.

Depending upon the alignment of the nozzle focal point with respect to that of laser, then powder is then melted either mid-stream or as it enters the pool. As the laser source moves away, the molten material then quickly cools by conduction through the substrate, leaving a solidified deposit. The substrate is located on a 3 or 5-axis stage capable of translating in the X and Y-directions. Initially, a 3-D CAD model is created to represent the geometry of a desired component. The CAD model is then converted to a faceted geometry composed of multiple slices used to direct the movement of the X-Y stage where each slice represents a single layer of deposition. During the build, the powder-nozzle/laser/stage system first traces a 2-D outline of the cross section represented by each slice in the X-Y plane and then proceeds to fill this area with an operator-specified rastering pattern.

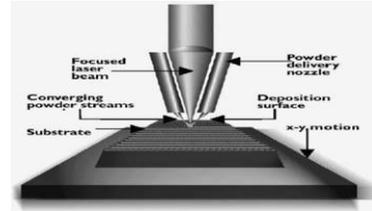

Figure 1 : Schematic Of LENSTM Deposition Process

The laser/nozzle assembly then ascends in the Z-direction so that the next layer can be added. This process is repeated for consecutive layers, until completion of the 3-D component^[2]. This feature is illustrated schematically in Figure 1.

II. Literature Review

Keicher *et al.*^[5] evaluated the effects of process parameters on multi-layer deposition of laser-melted powder Inconel® 625 in a process similar to both laser cladding and LENSTM. The group initially examined various parameters, including laser irradiance, stage translation speed, powder flow rate, powder particle size, and the size of each Z-directional increment between layers and their effect on heat affected zone (HAZ) size generated during the build. The HAZ was defined in this study as the melted region below the surface of the substrate and was examined post-build via metallographic analysis. Khaleel and Kar^[10] performed an investigation into the effects of several parameters on the resulting yield strength of AISI 304 stainless steel thin plates in process identical to LENSTM termed laser-aided direct rapid manufacturing (LADRM). This team sought to generate a range of input parameter values within which components with acceptable mechanical properties could be deposited. Their approach involved using the Buckingham II-Theorem to express the process variables associated with heat transfer and powder mass flux in terms of 14 dimensionless parameters. Rangaswamy *et al.*^[11,12] sought to experimentally measure residual stresses in LENSTM deposits using the neutron diffraction method, the details of which are discussed in next Section. The measurements were performed on LENSTM-produced rectangular plates of AISI 316. The neutron data was collected at several points methodically distributed within the geometry of the samples, to provide a map of the stress distribution then calculated the axial components of residual stress through Hooke's law. Each stress component was then plotted against position within the plate, first, along the height (Z direction) on the sample vertical centerline, and next, along the width (Y-direction) on the plate horizontal centre line. Wang and Felicelli^[15] next performed a parametric study similar to that done by Hofmeister *et al.*^[8] to determine if the same trends in

cooling rates and thermal gradients were observable for different laser power. He repeated the previous simulation using five power intensity values, revealing that the temperature gradient at the edge of the molten pool increases substantially with laser power, while the cooling rate decreases. Neela and De^[16] to study the effects of translation speed and laser power on the resulting temperature profiles using the general purpose FE package, ABAQUS® 6.6. The researchers used an element Activation/deactivation similar to those previously to model the deposition of a thin plate of AISI 316 with temperature-dependent thermal conductivity and specific heat according to a liner, and quadratic relation, respectively. Deus and Mazumder^[17] attempted to predict the residual stresses resulting from a laser cladding deposition of C95600 copper alloy onto an AA333 aluminium alloy substrate. Since residual stresses would be generated by the heterogeneous

thermal expansions of the deposited and substrate materials, accurate stress calculations would also require accurate prediction of the temperature fields created during the build. Labudovic *et al.*^[18] to predict residual stresses in a process identical to LENSTM termed the direct laser metal powder deposition process. A 3-D coupled model was implemented through the FE package ANSYS® for the deposition of a 50 mm x 20 mm x 10 mm thin plate of MONEL 400 onto a substrate of AISI 1006. The deposition was modelled with an ANSYS® element activation option similar to those already presented. Energy input density was modelled as a moving Gaussian distribution through the ANSYS® Parametric Design Language subroutine. The constitutive model was a temperature-dependent viscoplastic model, in which viscous effects were neglected by ignoring it the associated term in the equation of state.

III. CAD MODEL

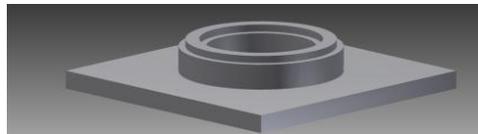

Figure 2 : Cad model for one end stepped cylindrical wall

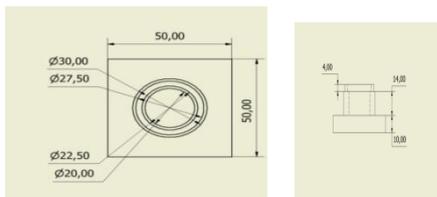

Figure 3 : Dimension for one end stepped cylindrical wall

The cylindrical wall model is created in the cylindrical coordinate system. x and y coordinates are defined as the radial and angular directions, respectively, while the z coordinate is defined in the vertical direction. A model for LENS process is built. As shown in Figure 3, Substrate : 50 x 50 x 10 mm. The example under consideration cylindrical wall upper cylinder has outer diameter 27.50 mm, inner diameter 22.50 mm and thickness 5 mm. the lower cylinder has outer diameter 30 mm, inner diameter 20 mm and thickness 10 mm. the total height $H=18$ mm. The 20 layers in the cylindrical wall height here each layer is assumed of equal 0.9 mm height .

IV. FINITE ELEMENT MODEL

The general purpose FE package ANSYS is used for both the thermal and stress analyses performed sequentially with an appropriate combination of elements. The main features of the 3D model are the moving heat input, the element birth-and-death technique, the heat loss, the temperature-dependent material properties, and the application of ANSYS parametric design language (APDL) to model the moving heat source and adaptive boundary conditions. The element types used in the thermal and structural analyses are SOLID70 and SOLID45, respectively. Both of them are the 8-noded brick elements that are compatible and can be automatically converted to each other during the solution process. The meshes used for

both simulations (thermal and structural) are the same. As shown in Figure 4, a total of 88919 nodes, and 44321 elements are generated to accomplish this simulation.

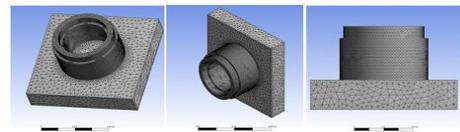

Figure 4: Meshing model for one end stepped cylindrical wall

V. THERMAL STRESS ANALYSIS

The first iteration in the solution procedure solves the system of equations at an assumed starting temperature (298 K), and the subsequent iterations use temperatures from previous iterations to calculate the thermal conductivity and specific heat matrices. The first born element is positioned onto the substrate with a set of initial and boundary conditions. For the subsequent elements, the model uses there results from the previous step as the initial condition for the birth of each new set of elements. This process is repeated for all the birthing events until the geometry is completed. After the structure has been built up the iterative process continues for some time required for the deposit to reach room temperature (the cooling sequence). Once the thermal simulation is done, the data regarding the temperature distribution in the buildup structure during the process is stored to a database. That data is used in the next step (structural analysis) as the only load that is applied as the body force. The structural simulation consists of the same steps during the building and cooling sequences as in the case of the thermal simulation. So, the temperature distribution scheme from some specific load step in the thermal analysis is applied to the corresponding load step in the structural analysis. It is

necessary to define the boundary conditions in the structural analysis to prevent a rigid body motion. Also, the intention is to allow substrate bending and reduce the influence of the rigid substrate on the stress development in the buildup as much as it possible. For these reasons, displacement of the substrate side surface, perpendicular to the wall depositing direction, is assumed to be zero.

VI. RESULT AND DISCUSSION

Since the cylindrical wall doesn't have free edges, the temperature distribution is different the higher average temperature is present along the circular path. Also at the start-end point of each layer, the laser beam dwells for some short time during the z-direction incremental movement. At that time, the heat input per distance moved along the wall length is increased, and the molten pool penetrates deeper into the previous deposit. Consequently the temperature is higher. As shown in figure 5 the inside surface lower cylinder has least deformation of value between 0.04075 to 0.034934mm. and the outer surface has maximum deformation of value between 0.052383 to 0.046566 mm. The all surface of lower cylinder and top of substrate has normal stress of value between 0.12365 to -0.076904 Mpa. and the side surface of substrate has normal stress of value between -1.8819 to -2.0824 Mpa. As shown in figure 6 the top surface lower cylinder has maximum deformation of value between 0.077006 to 0.068877mm. and the bottom surface has intermediate deformation of value between 0.033668 to 0.02893

mm. and the side of substrate has minimum value of total deformation between 0.0052402 to 0.00050218 mm. The all surface of lower cylinder and all surface of substrate has normal stress of value between 153.54 and -53.541 Mpa. and maximum value of normal stress is 774.71 Mpa at contacting area of substrate and first layer of cylinder. As shown in figure 7 the top surface lower cylinder has maximum deformation of value between 0.086938 to 0.080775 mm. and the bottom surface has intermediate deformation of value between 0.056124 to 0.049961 mm. the top and all sides of substrate has minimum value of total deformation between 0.0068224 to 0.00065973 mm. The all surface of lower cylinder and all surface of substrate has normal stress of value between 74.086 to -137.53 Mpa. and maximum value of normal stress is 708.93 Mpa at contacting area of substrate and first layer of cylinder. As shown in figure 8 the top surface upper cylinder has maximum deformation of value between 0.090096 to 0.097008 mm. and the top and bottom surface of lower cylinder has intermediate deformation of value between 0.07627 to 0.034795 mm. The top and all sides of substrate has minimum value of total deformation between 0.014058 to 0.00023262 mm. The all surface of upper and lower cylinder and all surface of substrate has normal stress of value between 49.817 to -169.59 Mpa. and maximum value of normal stress is 708.03 Mpa at contacting area of substrate and first layer of cylinder.

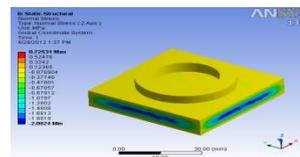

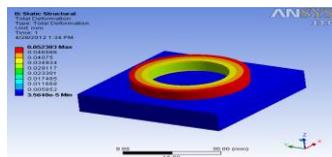

Figure 5 : Total deformation and Normal stress(σ_z) for 5 layers one end stepped cylindrical wall

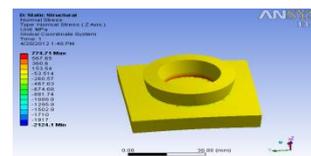

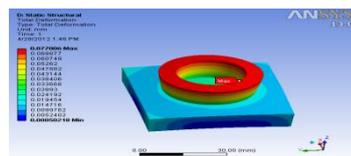

Figure 6 : Total deformation and Normal stress(σ_z) for 10 layers one end stepped cylindrical wall

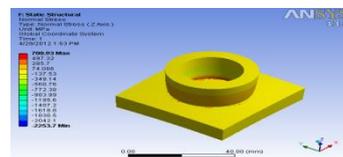

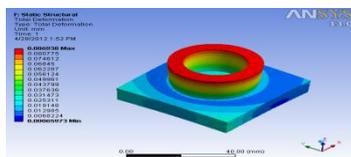

Figure 7 : Total deformation and Normal stress(σ_z) for 15 layers one end stepped cylindrical wall

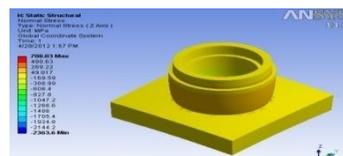

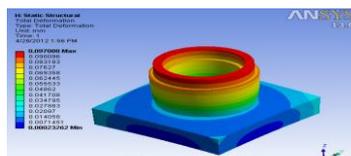

Figure 8 : Total deformation and Normal stress(σ_z) for 20 layers one end stepped cylindrical wall

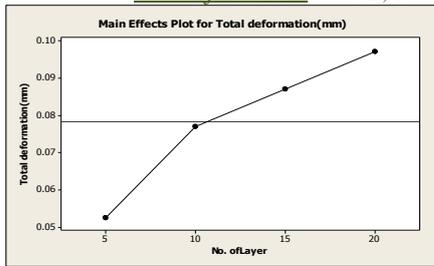

Figure 9: Graphical representation of total deformation for all layers

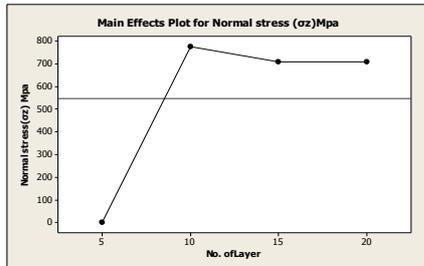

Figure 10: Graphical representation of Normal stress (σ_z) for all layers

As shown in figure 9 the cylindrical wall doesn't have free edges, the total deformation is different for 5, 10, 15, 20 layers. That difference means that the higher average deformation is present along the circular path which cause the higher deformation. Also at the start-end point of each layer, the laser beam dwells for some short time during the z-direction incremental movement. At that time, the heat input per distance moved along the wall length is increased, and the molten pool penetrates deeper into the previous deposit. Consequently the total deformation is higher, but it is still lower than at the free edges because of the larger volume of the heat sink. Generally speaking, the one-directional deposited wall has stress values slightly higher than the cylindrical deposited wall which is expected according to lower temperature differences during deposition. Also, the high localized stress above the tensile strength observed at the corners. Because of the deposition strategy, the stress close to the free edges is not symmetric. The tensile stress is higher at the ending free edge. Some differences of the stress distribution between the cylindrical deposited walls can be observed at the free edges. Since, there is no laser beam reverse in the one-direction deposition strategy, the compressive stress in the z-direction has lower values. The lower residual stress is expected more in the cylindrical wall, which is proved by the analysis. The maximum residual stress is obtained at the bottom of the cylinder and the value is lower than the material yield strength. The stress distribution along at the inner surface is uniform except at the free end and the bottom of the cylinder where the stress behaviour is complex. If this result is compared with the stress distribution along the same line at the outer surface, that is also uniform, it is obvious that the axial stress σ_z and hoop stress σ_y at the inner surface is tensile while the stress at the outer surface is compressive. The radial stress σ_x across the thickness of the wall changes the sign too, but it is much lower than the axial and hoop stress. As shown in figure 10 distribution of the stress causes a bending effect across the wall thickness.

VII. CONCLUSION

The total deformation at the layers 5, 10, 15, 20 indicate that the pre-defined location is heated up when the laser beam passes over, and the negative peaks indicate that the pre-defined location cools down after the laser beam passes by, from the initial layer to subsequent layer depositions. At the first layer, the cooling rate decreases when the subsequent layers are deposited. After the third layer is deposited, the first layer still receives a maximum cooling rate. The maximum cooling rate for each pass decreases as more layers are deposited, which is due to the integrated heat of the substrate and previous layers. The maximum residual stress is obtained at the bottom of cylinder and contacting area of substrate and first cylindrical layer. The inner surface is tensile and the outer surface is compressive in terms of stress distribution and this distribution of stresses causes the bending effect across the thickness direction. The distribution of residual stress in cylindrical wall is uniform. There is no immediate crack observed maximum residual stress accumulated at the substrate center region. The stress in a cylindrical wall is seen to have maximum value at the top, with this value increasing with an increase in the number of layers in a wall, reaching a value of -298 Mpa at the top of a 20-layer wall.

VIII. ACKNOWLEDGEMENTS

I would like to express my deep sense of gratitude and respect to my guide Prof. R.I.Patel sir for his excellent guidance, suggestions and constructive criticism. I consider myself extremely lucky to be able to work under the guidance of such a dynamic personality. I am also thankful to A.H.Makwana sir for his co-operation throughout the semester.

Abstract: In a modern day world alternative source of energy are given importance due to gradual depletion of fossil fuels reserves vegetable oils can be used as an alternative to diesel in CI engines. The use of vegetable oils in CI engine results in low CO and HC emissions compared to conventional diesel fuel. The present study covers the various aspects of biodiesels fuel derived from cottonseed oil. Cottonseed oil is converted to cottonseed oil methyl esters by transesterification process

An experimental investigations were carried out on C.I. engine with Bio Diesel blends of cotton seed Methyl Esters and Neem Oil Methyl Esters. The engine used for the experiments was single cylinder Four Stroke water cooled, constant speed diesel engine. Cotton seed Methyl ester (CSOME) and Neem oil methyl ester (NOME) are derived through transesterification process and parameters of transesterification were optimized. The blends of various proportions of the CSOME & NOME with diesel were prepared, analyzed and compared with diesel fuel, and comparison was made to suggest the better option among the bio diesel.

Various Tests have been carried out to examine properties, performance of different blends (C05, C10, C15, and C20) of CSOME and NOME in comparison to diesel. From the experimental Results it is indicated that C20 have closer performance to diesel. However, its diesel blends showed reasonable efficiencies. From the experimental results it is observed that cotton seed methyl ester gives better performance compared to Neem methyl esters and also the emissions and smoke for these diesel blends are less as compare to the pure diesel.

Keywords: Bio-diesel, Properties, Transesterification, Optimization, cottonseed oil methyl Ester (CSOME), Neem oil methyl ester (NOME)

I. Introduction

Energy is key input for technological, industrial, social and economical development of a nation. Five generations (125 years) ago, wood supplied up to 90% of our energy needs. Due to the convenience and low prices of fossil fuels wood use has fallen globally. The present energy scenario now is heavily biased towards the conventional energy sources such as petroleum products, coal, atomic energy etc, which are finite in nature besides causing environmental pollution. Of the available energy, the present energy utilization pattern is heavily biased for meeting the high energy requirement in urban and metropolitan cities. There are different types of BioDiesels are available such as Sunflower, Soyabean, Cottonseed, Linseed, Mahua, Jatropha, Pongamia, etc. [3]. The vegetable oils can be used in Diesel engines by various techniques such as fuel modifications by Transesterification, Diesel Vegetable blends and Vegetable oil heating etc. [4]. The present work was to investigate the evolution of Cotton seed and Neem seed oils with Diesel. Experiments were carried out at constant speed 1500 rpm and at different loads with different blends.

1.1 Fuel Modification

The alternative diesel fuels must be technically and environmentally acceptable and economically competitive. From the view point s of requirements, triglycerides (vegetable oils or animal fats) and their derivatives may be considered as viable alternative for diesel fuels [5]. The problems with substituting triglycerides for diesel fuels are mostly associated with high viscosity, low volatility and poly un-saturated character. The problems have been mitigated by developing vegetable oil derivatives that approximate the properties and performance and make them compatible with the hydro carbon based diesel fuels by following methods: Dilution (blending), Pyrolysis (cracking), Micro-emulsification [7] and Transesterification.

1.1.1 Transesterification:

Transesterification is the reaction of vegetable oil or animal fat with an alcohol, in most cases methanol, to form esters and glycerol. The transesterification reaction is affected by alcohol type, molar ratio of glycerides to alcohol, type and amount of catalyst, reaction temperature, reaction time and free fatty acids and water content of vegetable oils or animal fats. The transesterification reaction proceeds with or without a catalyst by using primary or secondary monohydric aliphatic alcohols having 1–8 carbon atoms as follows:

Triglycerides + Alcohol Glycerin + Mono-alkyl esters

Generally, the reaction temperature near the boiling point of the alcohol is recommended. Nevertheless, the reaction may be carried out at room temperature. The reactions take place at low temperatures (~65°C) and at modest pressures (2 atm, 1 atm = 101.325 kPa). Bio-diesel is further purified by washing and evaporation to remove any remaining methanol. The oil (87%), alcohol (9%), and catalyst (1%) are the inputs in the production of bio-diesel (86%), the main output. Pre-treatment is not required if the reaction is carried out under high pressure (9000 kPa) and high temperature (~240°C), where

simultaneous esterification and transesterification take place with maximum yield obtained at temperatures ranging from 60 to 80°C at a molar ratio of 6:1. The alcohols employed in the transesterification are generally short chain alcohols such as methanol, ethanol, propanol, and butanol. It was reported that when transesterification of soybean oil using methanol, ethanol and butanol was performed, 96–98% of ester could be obtained after 1 h of reaction.

II. Experimental set up

The experimental set up used in this investigation is shown in Fig. 2. It consists of a single cylinder, four stroke, constant speed, water cooled, variable compression ratio, direct injection compression ignition engine with hemispherical open combustion chamber. The fuel injection system of the engine comprised of a plunger type pump with an injector having three spray holes, each 0.28 mm diameter. The injector needle lift pressure and fuel injection timing of the engine are 210 bar and 27° before TDC respectively. The specifications of the engine are shown in Table 2.

A single cylinder four stroke water cooled diesel engine was coupled to an eddy current dynamometer with a load cell. The In-cylinder pressure was measured by piezoelectric pressure transducer (Kistler) fitted on the engine cylinder head. A crank angle encoder was used to sense the crank position. Exhaust gas analysis was performed using five gas exhaust analyzer (Netel Make). A Hartridge smoke meter was attached to exhaust pipe to measure smoke levels.

3.1 FUEL PROPERTY MEASUREMENT

The improvement in the performance of the CI engines, over the past century, has resulted from the complimentary refinement of the engine design and fuel properties. Calculate the fuel properties like flash point, fire point, specific gravity, calorific value for different oils for different blends using the suitable equipment. Some of the fuel properties include are

- Flash point
- Fire point
- Specific gravity
- Calorific value
- Viscosity
- Carbon residue

III. PERFORMANCE

The performance test was conducted on Single cylinder 4-stroke Diesel Engine with water cooling, constant speed which is coupled to Rope brake dynamometer. Initially the engine was tested with Pure Diesel and later on with different blends of the LSOME and NOME with Diesel were prepared, analyzed and compared with Diesel Fuel, and comparison was made to suggest the better option among Bio Diesel blend, however its Diesel blends showed reasonable efficiencies. Different engine performance parameters like Brake Power, Brake Thermal Efficiency, bsfc, IP, CV, Mechanical Efficiency etc were determined and results were plotted with respect to load.

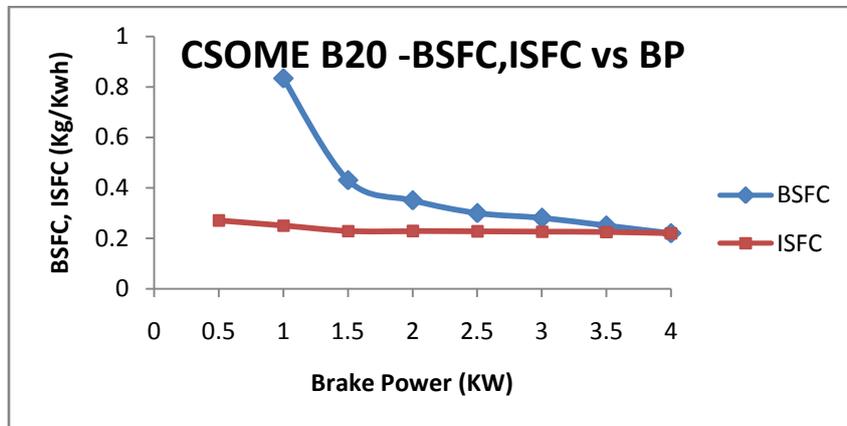

Fig. 3: Variations of CSOME C20-BSFC, ISFC Vs BP

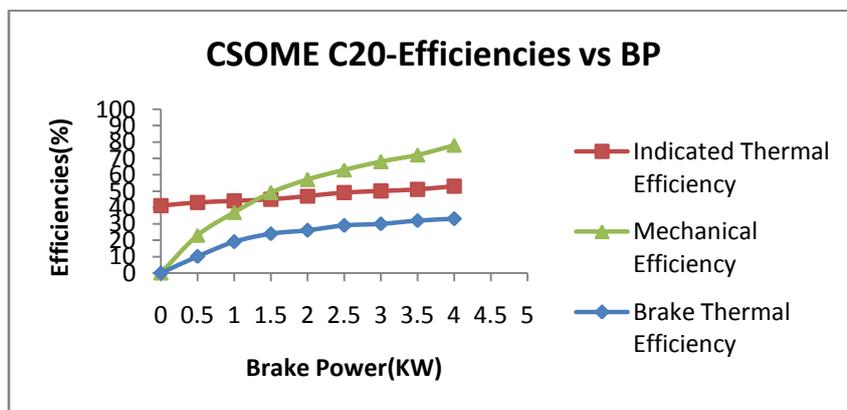

Fig 4: Variations of CSOME B20-EFFICIENCIES Vs BP

IV. RESULTS AND DISCUSSION

From the results obtained from experiments of Diesel and its blends the graphs were plotted with respect to load.

5.1 FUEL CONSUMPTION

The fuel consumption characteristics of an engine are generally expressed in terms of specific fuel consumption in kilograms of fuel per kilowatt-hour. It is an important parameter that reflects how good the engine performance is. It is inversely proportional to the thermal efficiency of the engine.

- Sfc = Specific fuel consumption per unit time/power

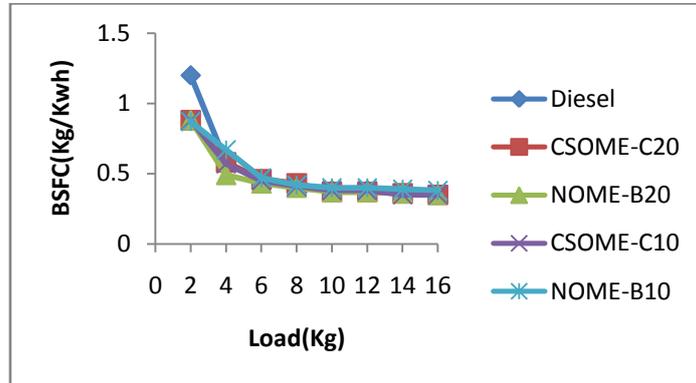

Fig 5: Variations of BSFC vs Load of CSOME & NOME blends with Diesel

From the above plot, it is observed that the brake specific fuel consumption (bsfc) for CSOME and NOME with Diesel are decreasing and these blends were giving better values as compared to the diesel fuel.

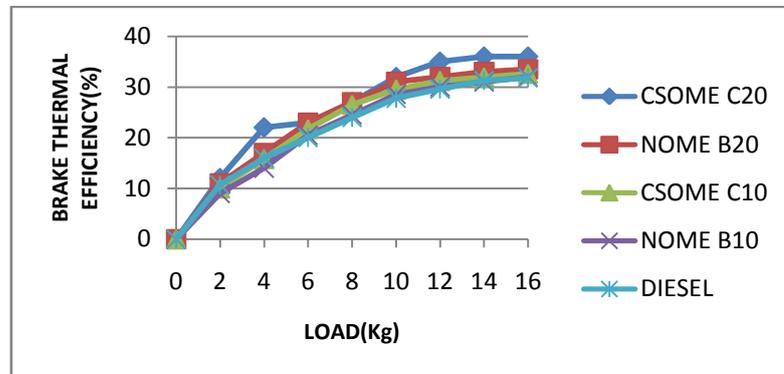

Fig 6: Variations of Brake Thermal Efficiency vs Load of CSOME & NOME with Diesel

From the plot, it is indicated that the Brake Thermal efficiencies of CSOME and NOME are slightly higher values as compared the Diesel because of complete combustion.

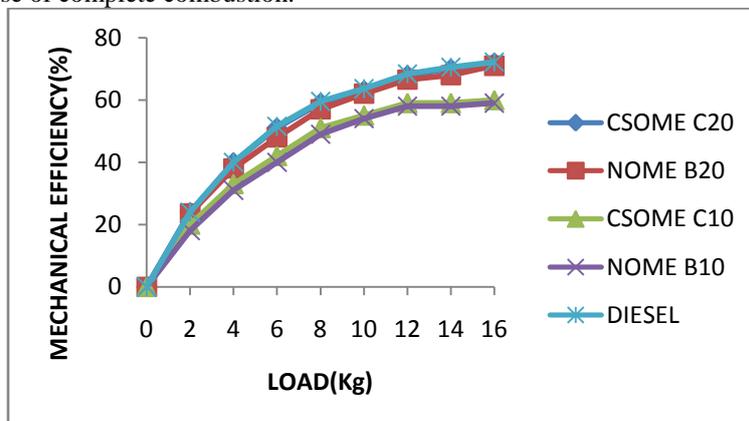

Fig 7: Variations of Mechanical Efficiency vs. Load of LSOME & NOME with Diesel

From the plot it is observed that Mechanical efficiency in case of Diesel with CSOME & NOME blends has been found that the mechanical efficiency is on par when compared to Diesel but a slight drop of efficiency was found with methyl esters (bio-diesel) when compared with diesel. This drop in thermal efficiency must be attributed to the poor combustion characteristics of methyl esters due to high viscosity. It was observed that the brake thermal efficiency of C10

and C20 are very close to brake thermal efficiency of diesel. C20 methyl ester had equal efficiency with diesel. So C20 can be suggested as best blend for bio-diesel preparation.

V. CONCLUSION

In the current investigation, it has confirmed that COTTONSEED and NEEM oil may be used as resource to obtain the bio diesel. The methyl esters of Cottonseed and Neem seed along with diesel may reduce the environmental impacts of transportation and also reduce the dependency on crude oil imports, and also provide employments in agricultural field. The conclusions are summarized as follows.

1. There was increase in Brake Thermal Efficiency of CSOME –C20 as compared to Pure Diesel because of complete combustion.
2. It was observed that the smoke and emissions for the blends of CSOME and NOME are less as compared to Pure Diesel.
3. Properties of the 20% blend of LSOME are nearer to the Diesel Fuel.
4. Thus the above investigations suggest that blend of CSOME – C20 is the optimum blend which can produce better values with Pure Diesel for Diesel engines as far as performance and emissions were considered.

3. PG Student, Dept of IT, SNS College Technology, Coimbatore

Abstract: Information Security means protecting information and information systems from unauthorized access, use, disclosure, disruption, modification, inspection, recording or destruction. The "Video Copy Detection" system is based on detecting video copies from a video sample to avoid copyright violations. To identify video sequences, Content Based Copy Detection (CBCD) presents an alternative to the watermarking approach. Content based Video fingerprinting methods extract several unique features of a digital video that can be stored as a fingerprint of the video content. Video copy detection system aims at deciding whether a query video segment is a copy of a video from the indexed dataset or not. The evaluation and identification of video content is then performed by comparing the extracted video fingerprints. The search algorithm searches the fingerprints that are stored in the database to find closest match with the fingerprints of the query video. The Interest point Matching algorithm is implemented to make the fingerprint robust against content changing attacks such as changing the background of the video. The proposed algorithm is tested on videos which are affected by the distortions like noise, changes in brightness/contrast, rotation, time shift and changes in background. The results give the high average true positive rate and low average false positive rate. The results demonstrate that the fingerprint extracted using this algorithm is robust. Video fingerprinting system is important for the applications like Digital Rights Management (DRM) area, particularly regarding the distribution of unauthorized content on the internet.

Index Terms: Content-Based Fingerprinting, Video Copy Detection, Video Copy Retrieval, Interest points

I. INTRODUCTION

The widespread availability of video content and services and the rapid diffusion of broadband platforms have brought new challenges to content owners, publishers and distributors. Video copy detection is a recent research domain which has emerged largely in response to this technological trend. The goal of video copy detection is to develop automated video analysis procedure to identify the original and modified copies of a video among the large amount of video data for the purposes of copyright control, monitoring and structuring large video databases.

A. Content Based Video Copy Detection

Content-Based Copy Detection (CBCD) schemes are an alternative to the watermarking approach for persistent identification of images and video clips. The primary concept of content-based copy detection (CBCD) is "the media itself is the watermark," i.e., the media (video, audio, image) contains enough unique information that can be used for detecting copies. Content-based copy detection schemes extract signatures from the original media and store it in a database. The same signatures are extracted from the test media stream and compared to the original media signature which is already extracted and stored in a database to determine if the test stream contains a copy of the original media. The signatures that are extracted from the media are termed as 'fingerprints'.

B. Fingerprint

Fingerprints are compact content-based signature that summarizes a video signal or another media signal. These signatures are feature vectors that uniquely characterize specific signal. Video fingerprinting is a proven and commercially available technique that can be used for content based copy detection. The task of a video-fingerprinting system is to detect whether a particular segment of video is (partly) based on the same original video as video footage in a database of reference videos.

The fingerprint of a video should be *robust* to the content-preserving distortions i.e., the changes made to the videos unintentionally or intentionally by the users of video sharing websites. It determines the tolerance of the system to different encoding processing that give rise to several distortions. Fingerprint should also be *discriminant* to make sure that different videos has distinguishable fingerprints. It should also be *secure* so that it is difficult for an adversary to generate similar fingerprints for different videos and manipulate the video copy detection systems.

C. Type of Fingerprints

Existing video fingerprints can be classified into four groups: spatial, temporal, colour and spatio-temporal fingerprints. A *spatial fingerprint* characterizes spatial features of a video frame and is computed independent of other

frames. These approaches are based on intensity statistics such as mean, variance, centroid, and other higher order moments of the spatial content of the different frames of the video. The frames are divided into subsections and for each section, the features are calculated. This approach allows uniform spatial processing over the entire frame. However it is less robust to geometrical operations like rotation and scaling. Examples of spatial features include luminance patterns, differential luminance or gradient patterns, and edges.

The *temporal fingerprint* describes temporal features of a video and is computed between two frames in the temporal direction. This involves comparing each frame against the previous frame. Differences between the two are flagged as motion. This is done by comparing macro-blocks of a pre-determined size. Motion is detected as a change in the color between frames within a macro-block, while the magnitude of the motion is deduced from the difference in color. A measure of the amount of motion of each frame relative to the preceding frame is calculated by summing the differences in color between these frames for all macro blocks. This results in a series of features, each indicative of a measure of motion between two adjacent frames over time. Consequently, the size of the motion fingerprints is dependent on the amount of motion that has been detected. Examples of temporal features include frame difference measures, motion vector patterns, and shot durations.

A *color fingerprint* captures color characteristics of a video frame and is computed in a color space such as RGB or YUV. Color-space-based fingerprints are among the first feature extraction methods used for video fingerprinting. They are mostly derived from the histograms of the colors in specific regions in time and/or space within the video. Since color features changes with different video formats these features have not been popular. Another drawback of the color features is that they are not applicable to black and white videos.

A *spatio-temporal fingerprints* contains both spatial and temporal informations about the video. They perform better than the fingerprints that use only spatial or temporal fingerprints. To capture relevant information from both temporal and spatial domain they apply temporal and spatial differentiation in the feature space. They take the differences of corresponding features extracted from subsequent blocks from one frame, and from subsequent frames in the temporal direction. This feature extraction is robust to global changes in luminance, also robust to luminance and contrast variations because only the signs of the difference are retrained. Their experimental results show that the method is also robust against MPEG compression and median filtering. Different types of fingerprints are combined to form a video fingerprint.

II. LITERATURE REVIEW

Hye-Jeong Cho et al.[6] proposed the hierarchical video copy detection method which estimates similarity using statistical characteristics between original video and its spatial variations. The target video is transformed by various spatial variations such as blurring, contrast change, zoom in, and zoom out. Zheng Cao et al.[15] computed a video signature based on ordinal measurement of video spatio-temporal distribution feature. The video similarity is measured by the computation of the distance of video signature. The duplicate videos are generated by spatio and temporal changes. Juan Chen[7] extracted key frames from the video sequences to save the computing time and storage space. Candidate descriptors are then determined in the local context by applying Harris point detection. The descriptors are invariant to spatial deformations like shifting, cropping and change of ratio.

Coskun et al. proposed a hash function [3] to extract a fingerprint based on signal processing operations. Two robust hash algorithms for video were implemented in this paper. Discrete Cosine Transform (DCT) based on classical basis set and Discrete Cosine Transform (DCT) based on a novel randomized basis set (RBT). The video here is considered as the 3D matrix. DCT transformations are applied to extract the coefficients and hashing was performed. The 3D transformations extract both spatial and temporal coefficients. The fingerprint is robust against signal processing modifications and channel transformations. Does not robust against malicious attacks. Security measures are not solved thoroughly in RBT [9].

Malekesmaeili.M et al generates fingerprints of a video sequence that carries both temporal and spatial information's [5]. This algorithm is applied for a 2D data. Gaussian filtering is applied to the video signals to prevent aliasing. Then the video signals are pre-processed (re-sampling and spatial resizing) to get the fixed frame size and frame rate. Then the video is divided into frames and weighted average of the frames is taken to obtain TIRI (Temporally Informative and Representative Images). DCT based hashing is applied which results in equal number of 0's and 1's. The fingerprint is robust to time shift, frame dropping, added Gaussian noise. But the performance is low for rotation and shift attacks. Hampapur et al uses a combination of feature based matching and inverted index files to detect copies of video clips [3].

CBCD does not modify the video stream and hence can be applied to find copies of media in circulation. The Reference Signature extract a set of signatures for the original media (M). The Test Signature extract the same set of signatures from the test media (T). Then the distance between the test and reference signatures are measured to compare both the signatures. If distance is lesser than a threshold, then it is a copied video. A set of representative frames are selected from each video item in the collection. The corresponding representative frames from each set are represented by an inverted image index table. Once a inverted image index has been created, it can be used to match a query image against the collection [3].

III. EXTRACTION OF FINGERPRINT

A fingerprint is a content-based signature which is derived from a video (or other form of a multimedia asset) so that it specifically represents the video or asset. To find a copy of a query video in a video database, one can search for a close match of its fingerprint in the corresponding fingerprint database[10].

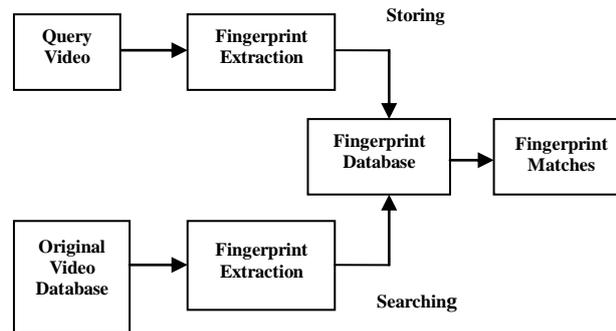

Fig.1. A complete Fingerprinting system

A. Tiri-Dct Algorithm

The existing algorithm for extracting the fingerprint is TIRI-DCT (Temporally Informative Representative Images). This method calculates a weighted average of the frames to generate representative images. This sequence will carry the temporal as well as spatial informations. The image is then divided into blocks. Then the first horizontal and the first vertical DCT coefficients (features) are then extracted from each block. The value of the features from all the blocks is concatenated to form the feature vector.[10] Each feature is then compared to a threshold (which is the median value of the feature vector) and then a binary fingerprint is generated.

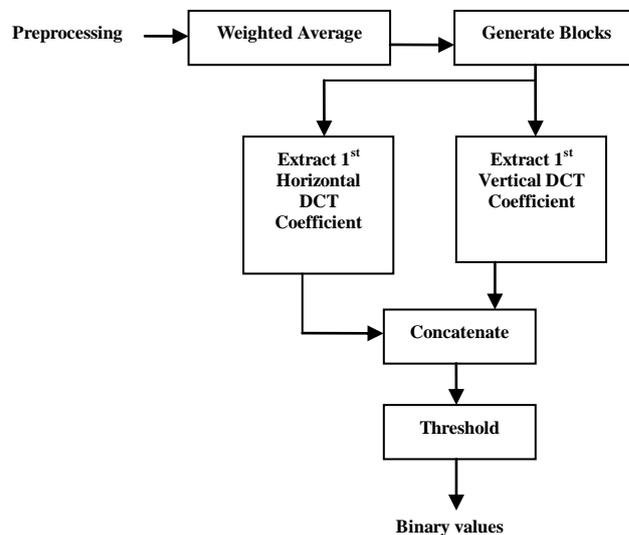

Fig.2Finger Print Algorithm Preprocessing Steps

In order to determine whether a query video is an attacked version of a video in a database or not, its fingerprint is first extracted. The fingerprint database (previously created from the videos in the video database) is then searched for the closest fingerprint to the extracted query fingerprint.

Two searching techniques are implemented:

- Inverted-File-Based Similarity Search
- Cluster-Based Similarity Search

1). Inverted-File-Based Similarity Search

The search method is based on the idea that for two fingerprints which are similar enough to be considered as matches, the probability of an exact match between smaller sub-blocks of those fingerprints is high. Divide each fingerprint into small non overlapping blocks of bits. [10]The horizontal dimension of this table refers to the position of a word inside a fingerprint, and the vertical direction corresponds to possible values of the word. The query is then compared to all the fingerprints that start with the same word. The Hamming distance between these fingerprints and the query is then

calculated. If a fingerprint has a Hamming distance of less than some predefined threshold, it will be announced as the match. When no match is found in the end, it is stated that the query does not belong to the database.

2). Cluster-Based Similarity Search

Clustering is used to reduce the number of queries that are examined within the database. By assigning each fingerprint to one and only one cluster (out of K clusters), the fingerprints in the database will be clustered into K non overlapping groups. To do so, a centroid is chosen for each cluster, termed the cluster head.[10]

A fingerprint will be assigned to a cluster if it is closest to this cluster's head. To determine if a query fingerprint matches a fingerprint in the database, the cluster head closest to the query is found. All the fingerprints (of the videos in the database) belonging to this cluster are then searched to find a match, i.e., the one which has the minimum Hamming distance (of less than a certain threshold) from the query. This process continues until a match is found or the farthest cluster is examined. If no match is found, the query is declared to be out of the database.

B. Problem Description

In existing system the fingerprint which is extracted using TIRI-DCT algorithm is not robust against the content changing attacks such as changing the background of the video or replacing picture in picture and the performance of the system is low in the presence of some other attacks, such as cropping, and logo insertion. The security of the fingerprint can be achieved only with the fingerprints of smaller length. Larger fingerprints results in a decrease in detection speed as they require more computation in calculating the hamming distance between the fingerprints. Also performance of the detection speed gets reduced when there are a large number of fingerprints in the database

IV. INTEREST POINT MATCHING ALGORITHM

Corner detection is an approach used to extract certain kinds of features and infer the contents of an image. Corner detection is frequently used in motion detection, image registration and video tracking. Corner detection overlaps with the topic of Interest point detection. An interest point is a point in an image which has a well defined position in an image and can be robustly detected. A good interest point detector has the following three properties:(1)The interest points are repeatable, (2)the descriptors produced from them are unique, (3) they are well-distributed spatially. An Interest point in an image has a clear, mathematically well-founded definition and has an well defined position in an image. It is stable under local and global distortions in an image domain. To increase the robustness of the fingerprint against the content changing attacks such as changing the background of the video an Interest point Matching algorithm is proposed. The conceptual basis of this algorithm is the detection of "super points," those points which have the greatest interest strength (i.e., which represent the most prominent features) and the subsequent construction of a control network. Sufficient spatial information is then available to reduce the ambiguity and avoid false matches.

The algorithm proposed in this paper includes two parts: A) Interest-point detection;B) interest-point matching.

A. Interest-Point Detection

The Harris detector is a well-known interest-point detection algorithm[17] to detect and extract the interest points. The Harris algorithm determines whether a point is a corner based on the Harris matrix A at the point $P(x, y)$. The interest strength is determined based on the magnitudes of the eigenvalues (γ_1 and γ_2) of A . The following function Mc was suggested as the interest strength:

$Mc = \det(A) - \kappa \text{trace}^2(A)$. The value of κ has to be determined empirically, and in the literature, values in the range of 0.04–0.06. If $Mc > 0$, it is a corner; otherwise, it is not a corner. Obviously, the corner should be the point with the local maximum value of Mc . By calculating the interest strength Mc over the whole image, an image which shows the interest strength can be obtained[17]

B. Interest-Point Matching

After the detection of interest points, a control network is constructed with the correspondences. Correspondences are defined as those interest points with the minimum difference in position and angle. Then the control network of each frame is compared.

If the location of the points are same then it is marked as 1 else it is marked as 0. Thus the binary sequences that are obtained are stored as the fingerprint.

V. EXPERIMENTAL RESULTS

To evaluate the performance of the proposed algorithm the videos are collected and stored in the database. TIRI-DCT and Interest-point matching algorithm were separately applied to each video in the database. A fingerprint database is formed for each algorithm and the extracted fingerprints are stored. Then, videos in the database were attacked(disorted) to generate query videos. The attacks include added Gaussian noise, changes in brightness/contrast, time shift, rotation and changes in background of the video. True Positive Rate and False Positive Rate are calculated for each algorithm. Let true positives (TP) be positive examples correctly labelled as positives

$$TPR = TP/P$$

False positives (*FP*) be negative examples incorrectly labelled as positives.

$$FPR = FP/N$$

F-Score is calculated to measure the accuracy of the system. If the value of the F-Score is low then it represents the poor system in terms of both robustness and discrimination. It considers both the precision *p* and the recall *r* of the test to compute the score

p is the number of correct results divided by the number of all returned results.

$$P = TP / (TP + FN)$$

and *r* is the number of correct results divided by the number of results that should have been returned.

$$R = TP / (TP + FP)$$

The F_1 score can be interpreted as a weighted average of the precision and recall, where an F_1 score reaches its best value at 1 and worst score at 0.

$$F = (1 + \beta^2) (\text{precision} \cdot \text{Recall}) / (\beta^2 \text{ precision} + \text{recall})$$

β value is chosen as 0.5 to give precision twice the importance of recall. Following table shows the F-score for different attack parameters: noise addition, change in brightness, contrast, rotation, time shift and changes in background.

TABLE I
COMPARING TIRI-DCT AND INTEREST-POINT-MATCHING ALGORITHM

Attacks	TIRI-DCT			INTEREST-POINT-MATCHING		
	TPR(%)	FPR(%)	F-SCORE	TPR(%)	FPR(%)	F-SCORE
Noise	91.9724	8.0276	0.8542	97.7549	2.2451	0.9049
Brightness	91.9500	8.0500	0.8615	97.7523	2.2477	0.9023
Contrast	91.2927	8.7073	0.8623	97.6701	2.3299	0.9021
Time shift	91.8374	8.1626	0.8587	97.6856	2.3144	0.9058
Rotate	92.1669	7.8331	0.8583	97.7106	2.2894	0.9023
Background Changed	91.5541	8.4459	0.8582	97.4372	2.5628	0.9057
Average	91.7955	8.204	0.8585	97.6684	2.3315	0.9038

The proposed Interest-Point-matching algorithm shows the higher F-score value than the existing algorithms. It maintains higher performance for all the attacks such as noise addition, change in brightness, contrast, rotation, time shift and changes in background. The algorithm maintains a high True Positive Rate of 97.66% and low False Positive Rate of 2.33%.

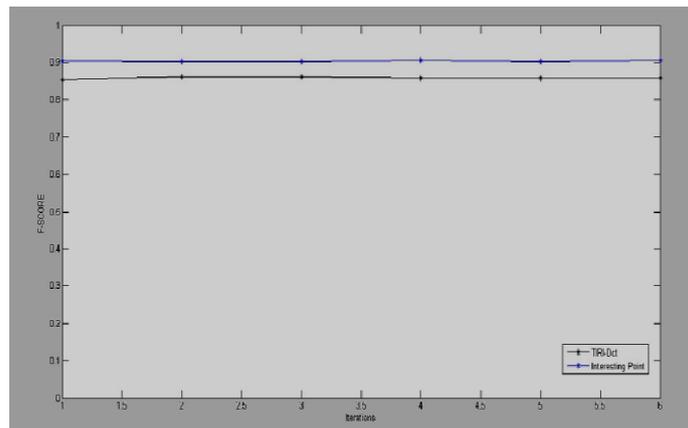

Fig.5. F-Score value of TIRI-DCT and Insert-Point-Matching algorithm for different attack parameters from Table I

VI. CONCLUSION AND FUTURE WORK

The fingerprinting system is proposed for video copy detection system. It can be used for copyright management and indexing applications. The system consists of a fingerprint extraction algorithm followed by an approximate search method. The proposed fingerprinting algorithm which is Interest point Matching Algorithm extracts robust, discriminate and compact fingerprints from videos in a fast and reliable fashion. The fingerprint extracted using this algorithm maintains a good performance for attacks such as noise addition, changes in brightness or contrast rotation, time shift, and changes in background. Two fast searching methods: Inverted file based searching and cluster based similarity search are implemented for efficient searching in the fingerprint database.

Future work includes enhancing the security to the fingerprint. It also includes the study of the performance of the system in the presence of some other attacks, such as large geometric attacks like cropping or inserting some logo. Comparing to the other fingerprinting methods our system will reduce the searching time so it improves to faster searching methods.

The Effects of Different Temperatures and Temperature Cycling On Breakdown Voltages of Tantalum Capacitors

Johanna Virkki

Department of Electronics/Tampere University of Technology, Finland

Abstract : This study focuses on the effects of different temperatures and temperature cycling on breakdown voltages of tantalum capacitors. High and low temperature tests and temperature cycling tests were done. In all tests the used temperatures were inside component's operating temperature limits. After the tests, capacitors were tested for their breakdown voltage. According to results of this research, high or low temperature testing inside component's operating temperature limits does not have an effect on the breakdown voltage of tantalum capacitors. However, temperature cycling inside component's operating temperature limits can lower the breakdown voltage of tantalum capacitors.

Keywords: accelerated testing, reliability, tantalum capacitors, temperature, temperature cycling

I. INTRODUCTION

In today's competitive market, it is important for a company to know the reliability of its products and to be able to control it for continued production at optimum reliability. Sometimes there is a need to examine the performance of a specific electronic component: it may be radically redesigned, or there may be an individual reliability specification for that component. That is why reliability testing of components has become a concern for electronics manufacturers. Also, in many cases, component-level reliability testing is undertaken to begin characterizing a product's reliability when full system-level test units are unavailable.

Electronic components are often stored and used at high or low temperatures, and sometimes temperature can change radically during component's lifetime. Temperature and temperature changes can have various, often unpredictable effects on components. Reliability tests seek to simulate the component's use environment in order to find the effects of environmental stresses. Because such testing is very time-consuming, accelerated testing becomes necessary. Accelerated testing is a procedure in which conditions are intensified to cut down the time required to obtain a weakening effect similar to one encountered in normal service conditions [1].

High Temperature Storage Life (HTSL), JESD22-A103C, and Low Temperature Storage Life (LTSL), JESD22-A119, tests "are applicable for evaluation, screening, monitoring, and/or qualification of all solid state devices and typically used to determine the effect of time and temperature, under storage conditions, for thermally activated failure mechanisms of solid state electronic devices [2, 3]." The standard HTSL test is run for 1000 hours (42 days) and the standard LTSL test for 168 hours (7 days) [2, 3]. During the tests, increased/reduced temperatures (test conditions) are used without electrical stress.

Temperature cycling, according to the standard JESD22-A104D, "is conducted to determine the ability of components and solder interconnects to withstand mechanical stresses induced by alternating high- and low-temperature extremes. Permanent changes in electrical and/or physical characteristics can result from these mechanical stresses [4]." This standard test includes numerous temperature cycling conditions. The test usually lasts 500 or 1000 cycles.

These standard accelerated tests are commonly used for testing reliability of electronics and were used in this research. The object of this research was to test the effects of low temperature, high temperature, and the effects of temperature cycling on tantalum capacitors.

II. TANTALUM CAPACITORS

Surface mount solid tantalum capacitors (henceforth referred to as "tantalum capacitors", shown in Fig. 1) of a maximum voltage of 50V, a capacitance of 10 μ F, and an operating and non-operating temperature of -55°C to 125°C were used in this research. The structure of these capacitors is presented more detailed in Fig 2.

Figure 1. Bottom side of a surface mount tantalum capacitor used in this research.

A. Structure of tantalum capacitors

A tantalum capacitor (structure shown in Fig. 2) consists of three main elements: anode, cathode, and a dielectric layer of tantalum pentoxide that separates them. The capacitor contains an embedded tantalum pellet (anode), surrounded by a tantalum pentoxide, amorphous dielectric layer. The cathode is a semiconductor, manganese dioxide. This pellet is coated with carbon and then with silver to provide the final connecting layer to the cathode terminal. The tantalum wire passes through these layers and connects the positive termination to the tantalum pellet. The negative termination of the capacitor is attached with a silver adhesive to the silver paint layer. Next sections focus on possible failure mechanisms caused by temperature and changes in it.

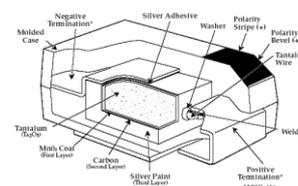

Figure 2. Structure of a tantalum capacitor [5].

B. Effects of temperature and temperature cycling on tantalum capacitors

Temperature, whether generated externally or internally, degrades the performance and reliability of tantalum capacitors. The use of tantalum capacitors at high temperatures has been studied, and manufacturing tantalum capacitors for high-temperature applications is found to be challenging [6, 7]. Mechanical stresses related to the temperature changes during reflow-manufacturing and use of surface mount tantalum capacitors at high temperatures affect their performance and reliability and can account for their breakdowns. Due to mismatch of the coefficients of thermal expansion between the constituent materials, significant mechanical stresses develop in the bulk of materials and at the interfaces. During heating, shear forces are exerted on the anode wire. The molded case pushes on the lead frame in one direction and the pellet in another, generating forces that pull the wire away from the anode structure. Once the device has passed through high temperatures and its elements are shrinking while cooling, they may not fit together as they did before the expansion. Compressive forces may appear on the pellet structure and produce fractures. In addition, these stresses may cause cracking in the tantalum pentoxide dielectric and/or delaminations at the interfaces, resulting in different failure modes of the components. A crack in the dielectric at a corner or edge, when exposed to high stress, may lead to failure [9-11]. The cracking increases leakage current, decreases breakdown voltage, and may cause short-circuits. On the other hand, delaminations can raise the effective series resistance and thus increase power dissipation and temperature of the capacitor, which can decrease its reliability. Severe delaminations may result in intermittent contacts and open-circuit failures of the components [11]. Temperature has also a specific effect inside a tantalum capacitor, known as crystal growth [12-14]. The tantalum pentoxide dielectric is considered an amorphous material. An amorphous state tends to order and crystallize to reduce its internal energy. Surface impurities can induce direct growth of tantalum pentoxide crystals and any imperfection in the dielectric structure is a potential site for crystals to grow. Once the dielectric crystallizes, conductivity and leakage current increase. The presence of impurities is not the only mechanism that may lead to a growth of crystals; Crystal growth can also be initiated in small areas of crystalline order in the dielectric. The conductivity of the crystallized structure has been reported to be higher than that of a dielectric in an amorphous state [14]. However, the latest findings suggest that the crystals themselves are good insulators with very limited conductivity [12, 13]. The exact conductivity mechanism related to the crystal phase is not yet fully understood. The increase in leakage current may still be caused by other mechanisms accelerated by the crystal growth. However, studies show that field crystallization may have only a limited impact on the end use of tantalum capacitors [12].

The temperature cycling of tantalum capacitors has been studied before [11, 15] with capacitors subjected to temperature cycling in a range from -40°C to 85°C [15], -65°C to 125°C, and -65°C to 150°C [11]. Results indicate that tantalum capacitors are capable of withstanding up to 500 cycles of temperature ranging from -65°C to 150°C. However, different lots show different robustness under

cycling conditions, and though parts may not fail formally by exceeding specified limits, a significant degradation in the leakage current and breakdown voltages indicates an increased propensity of some lots to failure after temperature cycling. Cracking in the tantalum pentoxide dielectric, which develops during temperature cycling, results not only in increased leakage current, but also increases the probability of scintillation breakdowns [11]. The results suggested that a harmful temperature cycling effect can be achieved in a much shorter time than in 500 cycles [15].

III. RELIABILITY TESTING

Testing was divided into five tests, hereafter called Tests A, B, C, D, and E. Test A was a low temperature test in -40°C temperature and lasted for 168h. Tests B and C were high temperature tests, Test B was done in 85°C and Test C was done in 125°C. Both tests lasted for 1000h. Tests D and E were temperature cycling tests. Both tests lasted for 500 cycles and one cycle lasted for 0.5h. In test D, the temperature changed between -40°C and 85°C and in Test E, temperature changed between -40°C and 125°C. In all tests, 18 capacitors were tested. Because the capacitors were rated for an operating and non-operating temperature of -55°C to 125°C, they were tested here within their operating limits. This was done in order to get information on their usability in such field conditions and to compare the effects of different temperatures and temperature cycling. All tests and their conditions can be seen in Table 1.

Table 1. All tests and their test conditions.

Test	A	B	C	D	E
Stresses	-40°C	85°C	125°C	-40°C 85°C	-40°C 125°C
Time	168h	1000h	1000h	500 0,5h	* 500* 0,5h

After all temperature tests, capacitors were tested for their breakdown voltage. The capacitors were tested for voltage that was slowly increased (rate of voltage increase: 1V per second) from 0V to 93V provided no failure occurred. The voltage range was chosen because of equipment limitations. The accuracy of measurement was 1V

IV. RESULTS AND DISCUSSION

Table 2 shows breakdown voltages for capacitors without testing and in Tests A-E. Accordingly, capacitors not submitted to any kind of temperature testing did not fail at voltages below 93V. This means that the capacitors can be expected to withstand voltages of over 93V.

Table 2. Failure voltages for capacitors without testing and in Tests A-E.

^{2*}Department of Physics, Rural Engineering College, Bhalki, Bidar, Karnataka, India.

Abstract: Magnesium nickel ferrites were synthesized by employing sol gel technique at 1473 K sintering temperature. A critical Rietveld analysis of XRD reveals that the presence of a very small amount of NiO phase along with the ferrite phase. It indicates that almost a stoichiometric (Mg,Ni)-ferrite phase has been obtained at 1473 K. SEM image shows that of (MgNi) ferrite is regular in shape have granular in structure, compact and well connected grain to each others. The ac conductivity increases with increase in applied frequency. The magnesium nickel ferrite (MnNiFe₂O₄) shows σ_{ac} conductivity of 1.2×10^{-4} S/cm. This is may be attributed to the dipole polarization i.e., the rotation of dipoles between two equivalent equilibrium positions is involved. The high value of dielectric constant of the sample MnNiFe₂O₄ may be the structural changes associated with the magnesium nickel ferrite when the grain size is reduced. Therefore, this ferrites material is attracted to use in many science and technological applications.

Keywords: Ac conductivity, (MgNi) ferrite, dielectric constant, Impedance spectra, X-ray diffraction.

I. INTRODUCTION

Small ferrimagnetic oxides, technically known as ferrites have attracted considerable attention not only from a fundamental scientific interest but also from a practical point of view for growing applications in the magnetic, electronic and microwave fields [1-3]. Simultaneous presence of magnetic and dielectric nature of ferrites is vastly exploited in a variety of applications at different frequencies. The special feature of these materials is that the properties can be tailored over wide ranges by appropriate substitution of various ions in the chemical formula unit and control of processing procedures. Ferrites are extensively used in magnetic recording, information storage, colour imaging, bio-processing, magnetic refrigeration and in magneto optical devices [4, 5].

Ferrites also have great promise for atomic engineering of materials with functional magnetic properties. The formation of corrosion product on the out of core surfaces in pressurized heavy water reactors (PHWRs) are major problem. Ferrite having spinal structure such as magnetic and nickel etc play a major role to prevent such problem. Thus attempts are being made to study the various ferrites to evaluate the impact of substitution of the divalent metal ions to modify the properties of these oxides [6-8].

In the present study authors, report synthesis, characterization and dielectric studies of MgNiFe₂O₄. A critical Rietveld analysis of XRD reveals that the presence of a very small amount of NiO phase along with the ferrite phase. It indicates that almost a stoichiometric (Mg,Ni)-ferrite phase has been obtained at 1473 K. SEM image shows that of (MgNi) ferrite is regular in shape have granular in structure, compact and well connected grain to each others. The ac conductivity increases with increase in applied frequency and dielectric constant decreases. Therefore, this ferrites material is attracted to use in many science and technological applications.

II. Experimental

All Chemicals used were analytical grade (AR). The magnesium chloride, nickel chloride (purity 99.99%) and dehydrated ferric chloride were procured and were used as received.

1.1 Synthesis Of Magnesium Nickel Ferrite

The chloride salts of magnesium, nickel chloride and ferric chloride are mixed in calculated stoichiometric with oxalic acid in equimolar ratio so as to form nickel ferric oxalate precursor. The precursor is then filtered and dried at 323K to achieve constant weight. The precursor is mixed with polyethylene glycol (PEG) in the ratio 1:5 and is ignited. The combustion propagates throughout the precursor. After completion of combustion nickel ferrite (MgNiFe₂O₄) is formed. The MgNi-ferrite is sonicated in acetone media for 20min and then calcinated at 1473 K to remove the impurities. Finally, fine graded nanosized nickel ferrite particles are formed [9, 10].

The pellets of 10 mm diameter are prepared with thickness varying up to 2 mm by applying pressure of 10 Tons in a UTM – 40 (40 Ton Universal testing machine). For temperature dependent conductivity and sensor studies, the pellets are coated with silver paste on either side of the surfaces to obtain better contacts.

1.2 CHARACTERIZATION

The X-ray diffraction (XRD) pattern of the MgNiFe₂O₄ was recorded at room temperature by employing an x-ray powder diffractometer (Rigaku Miniflex) with CuK α radiation ($\lambda=1.5405\text{\AA}$) in the 2θ (Bragg angles) range ($2^{\circ} \leq 2\theta \leq 10^{\circ}$) at a scan speed of $0.5^{\circ} \text{ minute}^{-1}$.

The percentage transmittances for the entire sample are measured from 300 to 4000 cm^{-1} . The SEM images of MgNiFe₂O₄ were recorded using Philips XL-30 (ESEM) scanning electron microscopy. The set up used for measuring ac conductivity is Hioki 3050 impedance analyzer, which is in turn interfaced to the computer.

III. RESULTS AND DISCUSSION

2.1 X-RAYS DIFFRACTION

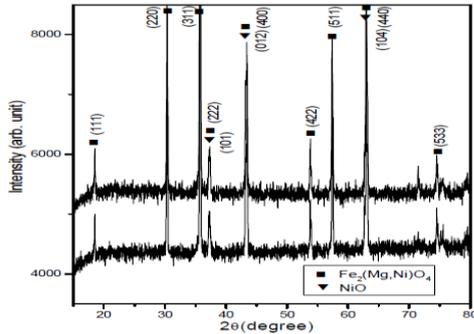

Figure 1 shows the XRD patterns of Mg,Ni)-ferrite annealed at temperature 1473 K.

It seems that the (Mg,Ni)-ferrite phase is formed completely after this heat-treatment. However, a critical rietveld analysis reveals the presence of a very small amount of NiO phase along with the ferrite phase. It indicates that almost a stoichiometric (Mg,Ni)-ferrite phase has been obtained at 1473 K. This indicates that the amount of ferrite phase formation is dependent of annealing time. By measuring particle size we actually measure the coherently diffracting zone of a grain. The particle or crystallites re separated from each other by grain boundaries and the grain boundaries are nothing but bulk crystal imperfections in a crystal [11]. The size of the crystallite in the nanometer range. As can be seen from the experiment, annealing the sample increases the size of the particles. Heat energy helps to annihilate the deformations in the crystals. As a result of grain boundaries started to vanish during annealing and the small crystallites agglomerate together to form larger particles due to intra-grain diffusion.

2.2 SCANNING ELECTRON MICROSCOPY

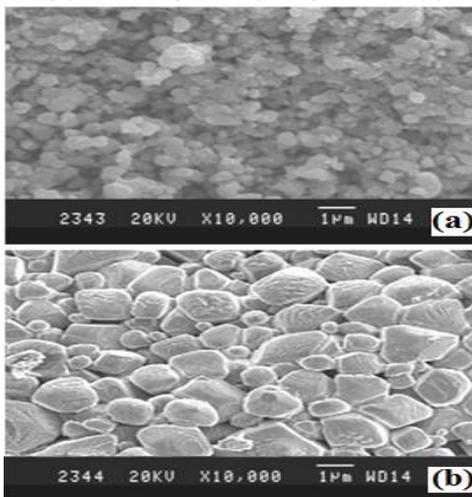

Figure 2 shows the SEM image of (a) NiO and (b) MgNi-ferrite at 1473 K.

Figure 2 (a) shows that SEM image of nickel oxide. It is clearly observed from the image they are agglomerated, highly branched and porous in nature. The

average grain size was calculated by using line intercept formula and it is found to be 0.21µm.

Figure 2 (c) shows that SEM image of (MgNi) ferrite. It is found that the image is regular in shape have granular in structure, compact and well connected grain to each others. The average grain size was calculated by using line intercept formula and it is found to be 0.7µm.

2.3 AC CONDUCTIVITY

The variation of σ_{ac} of $MnNiFe_2O_4$ as a function of frequency as shown in figure 3. The conductivity of nickel ferrites is increases with increase in frequency. The magnesium nickel ferrite ($MnNiFe_2O_4$) shows σ_{ac} conductivity of 1.2×10^{-4} S/cm.

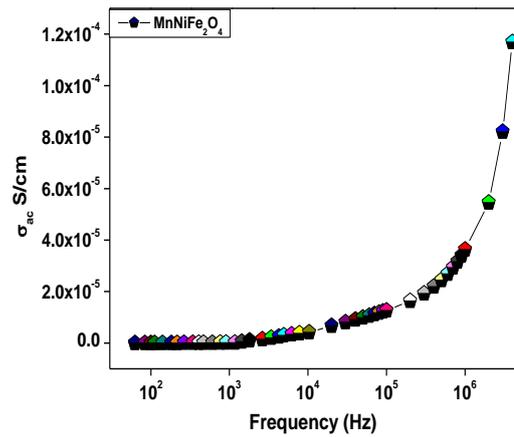

Figure 3 shows the variation of σ_{ac} of $MnNiFe_2O_4$ as a function of frequency.

This is may be attributed to the dipole polarization i.e., the rotation of dipoles between two equivalent equilibrium positions is involved. It is the spontaneous alignment of dipoles in one of the equilibrium positions that give rise to the nonlinear polarization behavior of this composition.

This behaviour of $MnNiFe_2O_4$ obeys the universal power law, $\sigma(\omega) = \sigma_0 + A\omega^n$ (the solid line is the fit to the expression), where σ_0 is the dc conductivity (frequency independent plateau in the low frequency region), A is the pre-exponential factor, and n is the fractional exponent between 0 and 1 [12]. On crystallization, the conductivity spectrum remains similar as that of the nickel ferrite except dispersion in the low frequency region, where the deviation from σ_{dc} (plateau region) is more prominent. The deviation from σ_{dc} (plateau region) value in the conductivity spectrum (in the low frequency region) is due to the electrode polarization effect. The values of σ_0 , A, and n were obtained by fitting the $\sigma(\omega)$ to $\sigma(\omega) = \sigma_0 + A\omega^n$. The overall behavior of σ_{ac} follows the universal dynamic response, which has widely been observed in disordered materials like ionically conducting glasses and also doped crystalline solids, and is generally believed to be reflected in the mechanism of charge transport behavior of charge carriers.

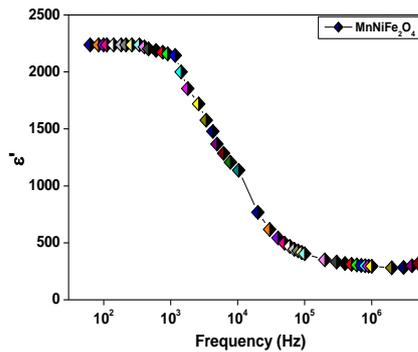

Figure 4 shows the variation real permittivity (ϵ') of nickel ferrite as a function of frequency.

Figure 4 shows the variation real permittivity (ϵ') of nickel ferrite of various composition as a function of logarithmic frequency. It is found that in all these nickel ferrite compositions, as frequency increases, dielectric constant decreases up to the frequency range of 10^3 Hz and after that it remains constant for further increasing in frequency [13]. The strong frequency dispersion of permittivity is observed in the low frequency region followed by a nearly frequency independent behaviour above 10^3 Hz. It is observed that Debye type relaxation mechanism is responsible for higher value of $\text{MnNiFe}_2\text{O}_4$.

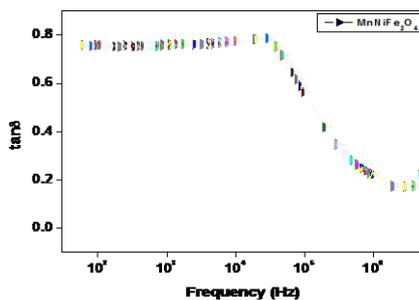

Figure 5 shows the variation of dielectric constant as a function of frequency of $\text{MnNiFe}_2\text{O}_4$

Figure 5 shows the variation of dielectric constant as a function of frequency for $\text{MnNiFe}_2\text{O}_4$. The high value of dielectric constant of the sample $\text{MnNiFe}_2\text{O}_4$ may be explained on the basis of the structural changes associated with the magnesium nickel ferrite when the grain size is reduced. Magnesium nickel ferrite crystallizes into a cubic close-packed arrangement of oxygen ions. It belongs to the class of ferrites with an inverse spinel structure having structural formula, $\text{Fe}^{3+}[\text{Mg}^{2+}\text{Ni}^{3+}]\text{O}_4$. The metal ions given in the square bracket are called octahedral (B site) ions and that outside the square bracket are called tetrahedral (A site) ions. The nickel ions (Ni^{2+}) together with half of the iron ions (Fe^{3+}) occupy the B site and the Mg^{2+} occupy the remaining half of the iron ions reside in A site. The presence of Mg^{2+} and Ni^{3+} ions gives rise to p-type carriers (holes) whereas Fe^{2+} and Fe^{3+} ions produce n-type carriers (electrons). Therefore, both electrons and holes that are present in the B sites are due to the presence of Mg and Ni ions. Since Mg ions are present in A sites, electrons are the carriers in A sites. The distance between the ions in A sites (0.357 nm) is larger than the distance between the ions in B site (0.292 nm) [14-16]. Also, the

degree of covalency for the A site ions is higher than that of the B site ions. All the above factors result in a high activation energy for the A sites compared to the B sites. Hence, in ordinary magnesium nickel ferrite with an inverse spinel structure the electron movement in B sites dominates compared to that in A sites.

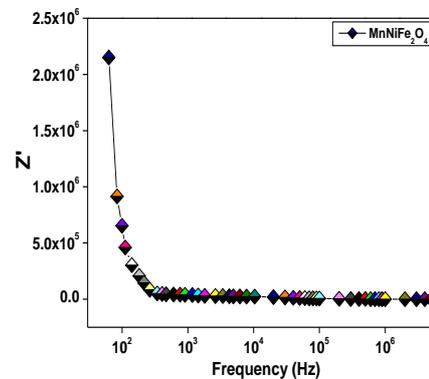

Figure 6 the variation of real part of impedance as a function of frequency

The variation of real part of impedance of $\text{MnNiFe}_2\text{O}_4$ is shown in figure 6 as a function of increasing frequency. It is observed that the real part of impedance decreases with increase in frequency. The initial decrease in impedance value due to the increase in conductivity at lower frequency region up to 10^3 Hz and further increases in applied frequency, the impedance value remains constant. This indicates that after 10^3 Hz the ferrite acts as lossless materials. Therefore, these ferrites can be used in many technological applications such as memory device, microwave, sensor, transducer, solar cell etc.

IV. CONCLUSION

Sol-gel technique was employed to prepare the magnesium nickel ferrites were at 1473 K sintering temperature. A critical Rietveld analysis of XRD reveals that the presence of a very small amount of NiO phase along with the ferrite phase. It indicates that almost a stoichiometric (Mg,Ni)-ferrite phase has been obtained at 1473 K. SEM image shows that of (MgNi) ferrite is regular in shape have granular in structure, compact and well connected grain to each others. The ac conductivity increases with increase in applied frequency. The magnesium nickel ferrite ($\text{MnNiFe}_2\text{O}_4$) shows σ_{ac} conductivity of 1.2×10^{-4} S/cm. This is may be attributed to the dipole polarization i.e., the rotation of dipoles between two equivalent equilibrium positions is involved. The high value of dielectric constant of the sample $\text{MnNiFe}_2\text{O}_4$ may be the structural changes associated with the magnesium nickel ferrite when the grain size is reduced. It is observed that the real part of impedance decreases with increase in frequency. The initial decrease in impedance value due to the increase in conductivity at lower frequency region up to 10^3 Hz and further increases in applied frequency, the impedance value remains constant. Therefore, this ferrites material is attracted to use in many science and technological applications.

Event, Cause, Space-Time and Quantum Memory Register- A Forty Two Storey Augmentation-Arrondissement Model

¹Dr. K. N. Prasanna Kumar, ²Prof. B. S. Kiranagi, ³Prof. C. S. Bagewadi

ABSTRACT: We study a consolidated system of event; cause and n Qubit register which makes computation with n Qubits. Model extensively dilates upon systemic properties and analyses the systemic behaviour of the equations together with other concomitant properties. Inclusion of event and cause, we feel enhances the "Quantum ness" of the system holistically and brings out a relevance in the Quantum Computation on par with the classical system, in so far as the analysis is concerned. Additional VARIABLES OF Space Time provide bastion for the quantum space time studies.-

I. INTRODUCTION:

EVENT AND ITS VINDICATION:

There definitely is a sense of compunction, contrition, hesitation, regret, remorse, hesitation and reservation to the **acknowledgement of** the fact that there is a personal **relation to** what **happens to** oneself. Louis de Broglie said that the events have already happened and it **shall disclose** to the people **based on** their level of consciousness. So there is destiny to start with! Say I am undergoing some seemingly insurmountable problem, which has hurt my sensibilities, susceptibilities and sentimentalities that I refuse to accept that that event was waiting for me to happen. In fact this is the statement of stoic philosophy which is referred to almost as bookish or abstract. Wound is there; it **had to happen** to me. So I was wounded. Stoics tell us that the wound **existed** before me; I was born **to embody** it. It is the question of consummation, consolidation, concretization, consubstantiation, that of this, that **creates an** "event" in us; thus you have **become a quasi cause for** this wound. For instance, my feeling to **become an** actor made me to behave with such perfectionism everywhere, that people's expectations rose and when I did not come up to them I **fell**; thus the 'wound' was waiting for me and 'I' was waiting for the wound! One fellow professor used to say like you are searching for ideas, ideas also searching for you. Thus the wound **possesses in itself** a nature which is "impersonal and preindividual" in character, beyond general and particular, the collective and the private. It is the question **of becoming** universalistic and holistic in your outlook. Unless this fate had not befallen you, the "**grand design**" would not have taken place in its entire entirety. It had to happen. And the concomitant ramifications and pernicious or positive **implications**. Everything is in order **because the** fate befell you. It is not as if the wound had to get something that is best from me or that I am a chosen by God to face the event. As said earlier 'the grand design' would have **been altered**. And **it cannot alter**. You got to play your part and go; there is just no other way. The legacy must go on. You shall be torch bearer and you shall hand over the torch to somebody. This is the name of the game in totalistic and holistic way.

When it comes to ethics, I would say it makes no sense if any obstreperous, obstreperous, ululations, serenading, tintinnabulations are made for the event has happened to me. It means to say that you are unworthy of the fate that has befallen you. To feel that what happened to you was unwarranted and not autonomous, telling the world that you are aggressively iconoclastic, veritably resentful, and volitionally resentient, is choosing the cast of allegation aspersions and accusations at the Grand Design. What is immoral is to invoke the name of god, because some event has **happened to** you. Cursing him is immoral. Realize that it is all "grand design" and you are playing **a part**. Resignation, renunciation, revocation is only one form of resentment. Willing the event is primarily **to release** the eternal truth; in fact you cannot release an event despite the fact everyone tries all ways and means they pray god; they prostrate for others destitution, poverty, penury, misery. But **releasing an** event is something like an "action at a distance" which only super natural power can do.

Here we are face to face with volitional intuition and repetitive transmutation. Like a premeditated skirmisher, **one quarrel** with one self, with others, with god, and finally the accuser **leaves** this world in despair. Now look at this sentence which was quoted by I think Bousquet "if there is a **failure of** will", "I will **substitute a** longing for death" for that shall be apotheosis, a perpetual and progressive glorification of the will.

EVENT AND SINGULARITIES IN QUANTUM SYSTEMS:

What is an event? Or for that matter an ideal event? An event **is a** singularity or rather a set of singularities or set of singular points **characterizing a** mathematical curve, a physical state of affairs, a psychological person or a moral person. Singularities are turning points and points of inflection: they are bottle necks, foyers and centers; they are points of fusion; condensation and boiling; points of tears and joy; sickness and health; hope and anxiety; they are so to say "sensitive" points; such singularities should not be confused or confounded, aggravated or exacerbated with personality of a system expressing itself; or the individuality and idiosyncrasies of a system which is designated with a proposition. They should also **not be fused** with the generalizational concept or universalistic axiomatic predications and postulation alcovishness, or the dipsomaniac flageolet dirge of a concept. Possible a concept could be signified by a figurative representation or a schematic configuration. "Singularity is essentially, pre individual, and has no personalized bias in it, or for that matter a prejudice or

pre circumspection of a conceptual scheme. It is in this sense **we can define a** "singularity" as being neither affirmative nor non affirmative. It can be positive or negative; it can **create or destroy**. On the other hand it must be noted that singularity is different both in its thematic discursive from the run of the mill day to day musings and mundane drooling. They are in that sense "extra-ordinary".

Each singularity is a **source and resource**, the origin, reason and raison d'être of a mathematical series, it could be any series any type, and that is interpolated or extrapolated to the structural location of the **destination of** another singularity. This according to this standpoint, there are different. It can be positive or negative; it can create or destroy. On the other hand it must be noted that singularity is different both in its thematic discursive from the run of the mill day to day musings and mundane drooling. There are in that sense "extra-ordinary".

This according to the widely held standpoint, there are different, multifarious, myriad, series IN A structure. In the eventuality of the fact that we conduct an unbiased and prudent examination of the series belonging to different "singularities" we can come to indubitable **conclusions** that the "singularity" of one system is different from the "other system" in the subterranean realm and ceratoid dualism of comparison and contrast

EPR experiment derived that there exists a communications between two particles. We go a further step to say that there **exists a channel** of communication however slovenly, inept, clumpy, between the two singularities. It is also possible the communication exchange could be one of belligerence, cantankerousness, tempestuousness, astutely truculent, with ensorcelled frenzy. That does not matter. All we are telling is that singularities communicate with each other.

Now, how do find **the reaction** of systems to these singularities. You do the same thing a boss does for you. "Problematize" the events and see how you behave. I will resort to "pressure tactics". "intimidation of deriding report", or "cut in the increment" to make you undergo trials, travails and tribulations. I am happy to see if you improve your work; but may or may not be sad if you succumb to it and hang yourself! We do the same thing with systems. systems show conducive response, felicitous reciprocation or behave erratically with inner roil, eponymous radicalism without and with blitzy conviction say like a solipsist nature of bellicose and blustering particles, or for that matter coruscation, trepidational **motion in** fluid flows, or seemingly perfidious incendiaries in gormandizing fellow elementary particles, abnormal ebullitions, surcharged calumniation and unwarranted(you think so but the system does not!) unrighteous fulminations.

So the point that is made here is "like we problematize the "events" to understand the human behaviour we have to "problematize" the events of systems to understand their behaviour.

This statement is made in connection to the fact that there shall be **creation or destruction** of particles or complete obliteration of the system (blackhole evaporation) or obfuscation of results. Some systems are like "inside traders" they will not put signature at all! How do you find they did it! Anyway, there are possibilities of a CIA finding out as they recently did! So we can do the same thing with systems to. This is accentuation, corroboration, fortification, .fomentatory notes to explain the various coefficients we have used in the model as also the dissipations called for

In the Bank example we have clarified that various systems are individually conservative, and their conservativeness extends holistically too. that one law is universal does not mean there is complete adjudication of **nonexistence of** totality or global or holistic figure. Total always exists and "individual" systems always exist, if we do not bring Kant in to picture! For the time being let us not! Equations would become more enuretic and frenzied..

Various, myriad, series in a structure. In the eventuality of the fact that we conduct an unbiased and prudent examination of the series belonging to different "singularities" we can come to indubitable conclusions that the "singularity" of one system is different from the "other system" in the subterranean realm and ceratoid dualism of comparison and contrast.

CONSERVATION LAWS:

Conservation laws bears ample testimony ,infallible observatory, and impeccable demonstration to the fact that the essential predications, character constitutions, ontological consonances remain unchanged with evolution despite the system's astute truculence, serenading whimsicality, assymetric disposition or on the other hand anachronistic dispensation ,eponymous radicality, entropic entrepotishness or the subdued ,relationally contributive, diverse parametrisizational, conducive reciprocity to environment, unconventional behaviour, enuretic nonlinear frenetic ness ,ensorcelled frenzy, abnormal ebullitions, surcharged fulminations , or the inner roil. And that holds well with the evolution with time. We present a model of the generalizational conservation of the theories. A theory of all the conservation theories. That all conservation laws hold and there is no relationship between them is bête noir. We shall on this premise build a 36 storey model that deliberates on various issues, structural, dependent, thematic and discursive,

Note THAT The classification is executed on systemic properties and parameters. And everything that is known to us measurable. We do not know "intangible". Nor we accept or acknowledge that. All laws of conservation must hold. Hence the holistic laws must hold. Towards that end, interrelationships must exist. All science like law wants evidence and here we shall provide one under the premise that for all conservations laws to hold each must be interrelated to the other, lest the very conception is a fricative contremps. And we live in "Measurement" world.

QUANTUM REGISTER:

Devices that **harness and explore** the fundamental axiomatic predications of Physics has wide ranging amplitudinal **ramification** with its essence of locus and focus on information processing that outperforms their classical counterparts, and for unconditionally secure communication. However, in particular, implementations **based on** condensed-matter systems face the challenge of short coherence times. Carbon materials, particularly diamond, however, are suitable **for hosting** robust solid-state quantum registers, **owing to** their spin-free lattice and weak spin-orbit **coupling**. Studies with the structurally notched criticism and schizoid fragments of manifestations of historical perspective of diamond hosting quantum register

have borne ample testimony and, and at differential and determinate levels have articulated the generalized significations and manifestations of quantum logic elements can **be realized** by exploring long-range magnetic dipolar coupling between individually addressable single electron spins **associated with** separate colour centres in diamond. The strong distance dependence of this coupling was used to characterize the separation of single qubits ($98 \pm 3 \text{ \AA}$) with accuracy close to the value of the crystal-lattice spacing. Coherent **control over** electron spins, **conditional** dynamics, selective readout as well as switchable **interaction** should rip open glittering façade for a prosperous and scintillating irreducible affirmation of open the way towards a viable room-temperature solid-state quantum register. As both electron spins are optically **addressable**, this solid-state quantum device **operating at** ambient conditions **provides a** degree of **control** that is at present available only for a few systems at low temperature (See for instance P. Neumann, R. Kolesov, B. Naydenov, J. Bec F. Rempp, M. Steiner V. Jacques,, G. Balasubramanian, M. L. Markham,, D. J. Twitchen,, S. Pezzagna,, J. Meijer, J. Twamley, F. Jelezko & J. Wrachtrup)-

Where we suppose

(A) $(a_i)^{(1)}, (a'_i)^{(1)}, (a''_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (b''_i)^{(1)} > 0,$
 $i, j = 13, 14, 15$

(B) The functions $(a''_i)^{(1)}, (b''_i)^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a''_i)^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b''_i)^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b'_i)^{(1)} \leq (\hat{B}_{13})^{(1)}$$

(C) $\lim_{T_2 \rightarrow \infty} (a''_i)^{(1)}(T_{14}, t) = (p_i)^{(1)}$
 $\lim_{G \rightarrow \infty} (b''_i)^{(1)}(G, t) = (r_i)^{(1)}$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants
 and $i = 13, 14, 15$

They satisfy Lipschitz condition:

$$|(a''_i)^{(1)}(T'_{14}, t) - (a''_i)^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T'_{14} - T_{14}| e^{-(\hat{M}_{13})^{(1)}t}$$

$$|(b''_i)^{(1)}(G', t) - (b''_i)^{(1)}(G, T)| < (\hat{k}_{13})^{(1)} ||G - G'| e^{-(\hat{M}_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(1)}(T'_{14}, t)$ and $(a''_i)^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a''_i)^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a''_i)^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a'_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15,$ satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a'_i)^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b'_i)^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$\frac{dT_{38}}{dt} = (b_{38})^{(7)}T_{37} - [(b'_{38})^{(7)} - \boxed{(b''_{38})^{(7)}((G_{39}, t))} - \boxed{(b''_{18})^{(7)}((G_{19}, t))} - \boxed{(b''_{20})^{(7)}((G_{14}, t))}] -$	128
$b_{22}''7G_{23}, t - b_{26}''7G_{27}, t - b_{30}''7G_{31}, t - b_{34}''7G_{35}, t$	129
T_{38}	130
	131
	132

$+(a''_{36})^{(7)}(T_{37}, t) =$ **First augmentation factor** 134

Definition of $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}$:	156
Where $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}$ are positive constants and $i = 20, 21, 22$	
They satisfy Lipschitz condition:	157
$ (a_i'')^{(3)}(T_{21}', t) - (a_i'')^{(3)}(T_{21}, t) \leq (\hat{k}_{20})^{(3)} T_{21}' - T_{21} e^{-(\hat{M}_{20})^{(3)}t}$	158
$ (b_i'')^{(3)}(G_{23}', t) - (b_i'')^{(3)}(G_{23}, t) < (\hat{k}_{20})^{(3)} G_{23}' - G_{23} e^{-(\hat{M}_{20})^{(3)}t}$	159
With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(3)}(T_{21}', t)$ and $(a_i'')^{(3)}(T_{21}, t)$. (T_{21}', t) and (T_{21}, t) are points belonging to the interval $[(\hat{k}_{20})^{(3)}, (\hat{M}_{20})^{(3)}]$. It is to be noted that $(a_i'')^{(3)}(T_{21}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{20})^{(3)} = 1$ then the function $(a_i'')^{(3)}(T_{21}, t)$, the THIRD augmentation coefficient, would be absolutely continuous.	160
Definition of $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$:	161
(J) (6) $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$, are positive constants	
$\frac{(a_i)^{(3)}}{(\hat{M}_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(\hat{M}_{20})^{(3)}} < 1$	
There exists two constants $(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ which together with $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}, (\hat{A}_{20})^{(3)}$ and $(\hat{B}_{20})^{(3)}$ and the constants $(a_i)^{(3)}, (a_i')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}, i = 20, 21, 22$, satisfy the inequalities	162
$\frac{1}{(\hat{M}_{20})^{(3)}} [(a_i)^{(3)} + (a_i')^{(3)} + (\hat{A}_{20})^{(3)} + (\hat{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1$	163
$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b_i')^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1$	164
Where we suppose	165
(K) $(a_i)^{(4)}, (a_i')^{(4)}, (a_i'')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (b_i'')^{(4)} > 0, i, j = 24, 25, 26$	166
	167
	168
	169

(L) (7) The functions $(a_i'')^{(4)}, (b_i'')^{(4)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(4)}, (r_i)^{(4)}$:

$$\begin{aligned} (a_i'')^{(4)}(T_{25}, t) &\leq (p_i)^{(4)} \leq (\hat{A}_{24})^{(4)} \\ (b_i'')^{(4)}((G_{27}), t) &\leq (r_i)^{(4)} \leq (b_i')^{(4)} \leq (\hat{B}_{24})^{(4)} \end{aligned}$$

170

(M) (8) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(4)}(T_{25}, t) = (p_i)^{(4)}$

$$\lim_{G \rightarrow \infty} (b_i'')^{(4)}((G_{27}), t) = (r_i)^{(4)}$$

Definition of $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}$:

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$

171

They satisfy Lipschitz condition:

$$\begin{aligned} |(a_i'')^{(4)}(T_{25}, t) - (a_i'')^{(4)}(T_{25}, t)| &\leq (\hat{k}_{24})^{(4)} |T_{25} - T_{25}'| e^{-(\hat{M}_{24})^{(4)}t} \\ |(b_i'')^{(4)}((G_{27}), t) - (b_i'')^{(4)}((G_{27}), t)| &\leq (\hat{k}_{24})^{(4)} |(G_{27}) - (G_{27})'| e^{-(\hat{M}_{24})^{(4)}t} \end{aligned}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(4)}(T_{25}', t)$ and $(a_i'')^{(4)}(T_{25}, t)$

172

(T_{25}', t) and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that

$(a_i'')^{(4)}(T_{25}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function

173

$(a_i'')^{(4)}(T_{25}, t)$, the **FOURTH augmentation coefficient WOULD** be absolutely continuous.

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

174

(N) $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

(O)

$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}} + \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

175

(P) (9) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with

$(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}, (\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}, (a_i')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}, i = 24, 25, 26$,

satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a_i')^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b_i')^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

Where we suppose

176

(Q) $(a_i)^{(5)}, (a_i')^{(5)}, (a_i'')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (b_i'')^{(5)} > 0, i, j = 28, 29, 30$

177

(R) (10) The functions $(a_i'')^{(5)}, (b_i'')^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}, (r_i)^{(5)}$:

$$\begin{aligned} (a_i'')^{(5)}(T_{29}, t) &\leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)} \\ (b_i'')^{(5)}((G_{31}), t) &\leq (r_i)^{(5)} \leq (b_i')^{(5)} \leq (\hat{B}_{28})^{(5)} \end{aligned}$$

178

(S) (11) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(5)}(T_{29}, t) = (p_i)^{(5)}$

$$\lim_{G \rightarrow \infty} (b_i'')^{(5)}(G_{31}, t) = (r_i)^{(5)}$$

Definition of $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}$:

Where $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}$ are positive constants and $i = 28, 29, 30$

179

They satisfy Lipschitz condition:

$$\begin{aligned} |(a_i'')^{(5)}(T_{29}', t) - (a_i'')^{(5)}(T_{29}, t)| &\leq (\hat{k}_{28})^{(5)} |T_{29} - T_{29}'| e^{-(\hat{M}_{28})^{(5)}t} \\ |(b_i'')^{(5)}((G_{31}), t) - (b_i'')^{(5)}((G_{31}), t)| &\leq (\hat{k}_{28})^{(5)} |(G_{31}) - (G_{31})'| e^{-(\hat{M}_{28})^{(5)}t} \end{aligned}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(5)}(T_{29}', t)$ and $(a_i'')^{(5)}(T_{29}, t)$

180

(T_{29}', t) and (T_{29}, t) are points belonging to the interval $[(\hat{k}_{28})^{(5)}, (\hat{M}_{28})^{(5)}]$. It is to be noted that

$(a_i'')^{(5)}(T_{29}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{28})^{(5)} = 5$ then the function

$(a_i'')^{(5)}(T_{29}, t)$, the **FIFTH augmentation coefficient** attributable would be absolutely continuous.

181

Definition of $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$:

(T) $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$, are positive constants

$$\frac{(a_i)^{(5)}}{(\hat{M}_{28})^{(5)}} + \frac{(b_i)^{(5)}}{(\hat{M}_{28})^{(5)}} < 1$$

Definition of $(\hat{P}_{28})^{(5)}, (\hat{Q}_{28})^{(5)}$:

182

(U) There exists two constants $(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ which together with

$(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}, (\hat{A}_{28})^{(5)}$ and $(\hat{B}_{28})^{(5)}$ and the constants $(a_i)^{(5)}, (a_i')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}, i =$

28,29,30, satisfy the inequalities

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(a_i)^{(5)} + (a'_i)^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(b_i)^{(5)} + (b'_i)^{(5)} + (\hat{B}_{28})^{(5)} + (\hat{Q}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

Where we suppose

$$(a_i)^{(6)}, (a'_i)^{(6)}, (a''_i)^{(6)}, (b_i)^{(6)}, (b'_i)^{(6)}, (b''_i)^{(6)} > 0, \quad i, j = 32, 33, 34$$

(12) The functions $(a''_i)^{(6)}, (b''_i)^{(6)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(6)}, (r_i)^{(6)}$:

$$(a''_i)^{(6)}(T_{33}, t) \leq (p_i)^{(6)} \leq (\hat{A}_{32})^{(6)}$$

$$(b''_i)^{(6)}((G_{35}), t) \leq (r_i)^{(6)} \leq (b'_i)^{(6)} \leq (\hat{B}_{32})^{(6)}$$

$$(13) \lim_{T_2 \rightarrow \infty} (a''_i)^{(6)}(T_{33}, t) = (p_i)^{(6)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(6)}((G_{35}), t) = (r_i)^{(6)}$$

Definition of $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}$:

Where $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}$ are positive constants and $i = 32, 33, 34$

They satisfy Lipschitz condition:

$$|(a''_i)^{(6)}(T'_{33}, t) - (a''_i)^{(6)}(T_{33}, t)| \leq (\hat{k}_{32})^{(6)} |T'_{33} - T_{33}| e^{-(\hat{M}_{32})^{(6)}t}$$

$$|(b''_i)^{(6)}((G'_{35}), t) - (b''_i)^{(6)}((G_{35}), t)| < (\hat{k}_{32})^{(6)} ||G'_{35} - G_{35}'|| e^{-(\hat{M}_{32})^{(6)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(6)}(T'_{33}, t)$ and $(a''_i)^{(6)}(T_{33}, t)$

(T'_{33}, t) and (T_{33}, t) are points belonging to the interval $[(\hat{k}_{32})^{(6)}, (\hat{M}_{32})^{(6)}]$. It is to be noted that

$(a''_i)^{(6)}(T_{33}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{32})^{(6)} = 6$ then the function

$(a''_i)^{(6)}(T_{33}, t)$, the SIXTH **augmentation coefficient** would be absolutely continuous.

Definition of $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$:

$(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$, are positive constants

$$\frac{(a_i)^{(6)}}{(\hat{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\hat{M}_{32})^{(6)}} < 1$$

Definition of $(\hat{P}_{32})^{(6)}, (\hat{Q}_{32})^{(6)}$:

There exists two constants $(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ which together with $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}, (\hat{A}_{32})^{(6)}$ and $(\hat{B}_{32})^{(6)}$

and the constants $(a_i)^{(6)}, (a'_i)^{(6)}, (b_i)^{(6)}, (b'_i)^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}, i = 32, 33, 34$,

satisfy the inequalities

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(a_i)^{(6)} + (a'_i)^{(6)} + (\hat{A}_{32})^{(6)} + (\hat{P}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(b_i)^{(6)} + (b'_i)^{(6)} + (\hat{B}_{32})^{(6)} + (\hat{Q}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

Theorem 1: if the conditions IN THE FOREGOING above are fulfilled, there exists a solution satisfying the conditions

$$\bar{T}_{34}(t) = T_{34}^0 + \int_0^t \left[(b_{34})^{(6)} T_{33}(s_{(32)}) - \left((b'_{34})^{(6)} - (b''_{34})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{34}(s_{(32)}) \right] ds_{(32)}$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$ -261-262

(a) The operator $\mathcal{A}^{(1)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{13}(t) \leq G_{13}^0 + \int_0^t \left[(a_{13})^{(1)} \left(G_{14}^0 + (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}s_{(13)}} \right) \right] ds_{(13)} =$$

$$\left(1 + (a_{13})^{(1)} t \right) G_{14}^0 + \frac{(a_{13})^{(1)} (\hat{P}_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left(e^{(\hat{M}_{13})^{(1)}t} - 1 \right) \quad -263$$

From which it follows that

$$(G_{13}(t) - G_{13}^0) e^{-(\hat{M}_{13})^{(1)}t} \leq \frac{(a_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{P}_{13})^{(1)} + G_{14}^0 \right) e^{\left(-\frac{(\hat{P}_{13})^{(1)} + G_{14}^0}{\hat{M}_{13}^{(1)}} \right)} + (\hat{P}_{13})^{(1)} \right]$$

(G_i^0) is as defined in the statement of theorem 1-264

Analogous inequalities hold also for $G_{14}, G_{15}, T_{13}, T_{14}, T_{15}$ -265

The operator $\mathcal{A}^{(2)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that-266

$$G_{16}(t) \leq G_{16}^0 + \int_0^t \left[(a_{16})^{(2)} \left(G_{17}^0 + (\hat{P}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}s_{(16)}} \right) \right] ds_{(16)} = \left(1 + (a_{16})^{(2)} t \right) G_{17}^0 + \frac{(a_{16})^{(2)} (\hat{P}_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left(e^{(\hat{M}_{16})^{(2)}t} - 1 \right)$$

-267

From which it follows that

$$(G_{16}(t) - G_{16}^0) e^{-(\hat{M}_{16})^{(2)}t} \leq \frac{(a_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left[\left((\hat{P}_{16})^{(2)} + G_{17}^0 \right) e^{\left(-\frac{(\hat{P}_{16})^{(2)} + G_{17}^0}{\hat{M}_{16}^{(2)}} \right)} + (\hat{P}_{16})^{(2)} \right] \quad -268$$

Analogous inequalities hold also for $G_{17}, G_{18}, T_{16}, T_{17}, T_{18}$ -269

(a) The operator $\mathcal{A}^{(3)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{20}(t) \leq G_{20}^0 + \int_0^t \left[(a_{20})^{(3)} \left(G_{21}^0 + (\hat{P}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)} s_{(20)}} \right) \right] ds_{(20)} =$$

$$(1 + (a_{20})^{(3)} t) G_{21}^0 + \frac{(a_{20})^{(3)} (\hat{P}_{20})^{(3)}}{(\hat{M}_{20})^{(3)}} \left(e^{(\hat{M}_{20})^{(3)} t} - 1 \right) -270$$

From which it follows that

$$(G_{20}(t) - G_{20}^0) e^{-(\hat{M}_{20})^{(3)} t} \leq \frac{(a_{20})^{(3)}}{(\hat{M}_{20})^{(3)}} \left[\left((\hat{P}_{20})^{(3)} + G_{21}^0 \right) e^{-\frac{(\hat{P}_{20})^{(3)} + G_{21}^0}{G_{21}^0}} + (\hat{P}_{20})^{(3)} \right] -271$$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$ -272

(b) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{24}(t) \leq G_{24}^0 + \int_0^t \left[(a_{24})^{(4)} \left(G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(\hat{M}_{24})^{(4)} s_{(24)}} \right) \right] ds_{(24)} =$$

$$(1 + (a_{24})^{(4)} t) G_{25}^0 + \frac{(a_{24})^{(4)} (\hat{P}_{24})^{(4)}}{(\hat{M}_{24})^{(4)}} \left(e^{(\hat{M}_{24})^{(4)} t} - 1 \right) -273$$

From which it follows that

$$(G_{24}(t) - G_{24}^0) e^{-(\hat{M}_{24})^{(4)} t} \leq \frac{(a_{24})^{(4)}}{(\hat{M}_{24})^{(4)}} \left[\left((\hat{P}_{24})^{(4)} + G_{25}^0 \right) e^{-\frac{(\hat{P}_{24})^{(4)} + G_{25}^0}{G_{25}^0}} + (\hat{P}_{24})^{(4)} \right]$$

(G_i^0) is as defined in the statement of theorem 1-274

(c) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{28}(t) \leq G_{28}^0 + \int_0^t \left[(a_{28})^{(5)} \left(G_{29}^0 + (\hat{P}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)} s_{(28)}} \right) \right] ds_{(28)} =$$

$$(1 + (a_{28})^{(5)} t) G_{29}^0 + \frac{(a_{28})^{(5)} (\hat{P}_{28})^{(5)}}{(\hat{M}_{28})^{(5)}} \left(e^{(\hat{M}_{28})^{(5)} t} - 1 \right) -275$$

From which it follows that

$$(G_{28}(t) - G_{28}^0) e^{-(\hat{M}_{28})^{(5)} t} \leq \frac{(a_{28})^{(5)}}{(\hat{M}_{28})^{(5)}} \left[\left((\hat{P}_{28})^{(5)} + G_{29}^0 \right) e^{-\frac{(\hat{P}_{28})^{(5)} + G_{29}^0}{G_{29}^0}} + (\hat{P}_{28})^{(5)} \right]$$

(G_i^0) is as defined in the statement of theorem 1-276

(d) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{32}(t) \leq G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} \left(G_{33}^0 + (\hat{P}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)} s_{(32)}} \right) \right] ds_{(32)} =$$

$$(1 + (a_{32})^{(6)} t) G_{33}^0 + \frac{(a_{32})^{(6)} (\hat{P}_{32})^{(6)}}{(\hat{M}_{32})^{(6)}} \left(e^{(\hat{M}_{32})^{(6)} t} - 1 \right) -277$$

From which it follows that

$$(G_{32}(t) - G_{32}^0) e^{-(\hat{M}_{32})^{(6)} t} \leq \frac{(a_{32})^{(6)}}{(\hat{M}_{32})^{(6)}} \left[\left((\hat{P}_{32})^{(6)} + G_{33}^0 \right) e^{-\frac{(\hat{P}_{32})^{(6)} + G_{33}^0}{G_{33}^0}} + (\hat{P}_{32})^{(6)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$ -278
-279-280

It is now sufficient to take $\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$ and to choose

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{P}_{13})^{(1)} + \left((\hat{P}_{13})^{(1)} + G_j^0 \right) e^{-\frac{(\hat{P}_{13})^{(1)} + G_j^0}{G_j^0}} \right) \right] \leq (\hat{P}_{13})^{(1)} -283$$

$$\frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{Q}_{13})^{(1)} + T_j^0 \right) e^{-\frac{(\hat{Q}_{13})^{(1)} + T_j^0}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)} -284$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-285

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric

$$d \left((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\hat{M}_{13})^{(1)} t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\hat{M}_{13})^{(1)} t} \right\} -286$$

Indeed if we denote

Definition of \tilde{G}, \tilde{T} :

$$(\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_i^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(\hat{M}_{13})^{(1)} s_{(13)}} e^{(\hat{M}_{13})^{(1)} s_{(13)}} ds_{(13)} +$$

$$\int_0^t \{ (a'_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{-(\bar{M}_{13})^{(1)}s_{(13)}} + (a''_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}} + G_{13}^{(2)} | (a''_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) - (a''_{13})^{(1)} (T_{14}^{(2)}, s_{(13)}) | e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}} \} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-287

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{13})^{(1)}t} \leq \frac{1}{(\bar{M}_{13})^{(1)}} \left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\bar{A}_{13})^{(1)} + (\bar{P}_{13})^{(1)} (\hat{k}_{13})^{(1)} \right) d \left((G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)}) \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-288

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ and $(\bar{Q}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(1)}$ and $(b''_i)^{(1)}$, $i = 13, 14, 15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-289

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(1)} - (a''_i)^{(1)} (T_{14}(s_{(13)}), s_{(13)}) \} ds_{(13)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(1)}t} > 0 \text{ for } t > 0 \text{-290}$$

291

Definition of $(\bar{M}_{13})^{(1)}_1$, and $(\bar{M}_{13})^{(1)}_3$:

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$G_{13} < (\bar{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq ((\bar{M}_{13})^{(1)})_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq ((\bar{M}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)} ((\bar{M}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\bar{M}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)} ((\bar{M}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.-292

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below.-293

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(1)}(G(t), t)) = (b'_{14})^{(1)}$ then $T_{14} \rightarrow \infty$.

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b'_i)^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)} \text{-294}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right), t = \log \frac{2}{\varepsilon_1} \text{ By taking now } \varepsilon_1 \text{ sufficiently small one sees that } T_{14} \text{ is unbounded. The same property}$$

holds for T_{15} if $\lim_{t \rightarrow \infty} (b''_{15})^{(1)}(G(t), t) = (b'_{15})^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions -295

-296

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}}, \frac{(b_j)^{(2)}}{(\bar{M}_{16})^{(2)}} < 1$ and to choose

$(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ large to have-297

$$\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[(\hat{P}_{16})^{(2)} + ((\hat{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\hat{P}_{16})^{(2)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{16})^{(2)} \text{-298}$$

$$\frac{(b_j)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\hat{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{16})^{(2)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{16})^{(2)} \right] \leq (\hat{Q}_{16})^{(2)} \text{-299}$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i satisfying -300

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric

$$d \left(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)}) \right) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t} \} \text{-301}$$

Indeed if we denote

Definition of $\widetilde{G}_{19}, \widetilde{T}_{19} : (\widetilde{G}_{19}, \widetilde{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19})$ -302

It results

$$|\widetilde{G}_{16}^{(1)} - \widetilde{G}_i^{(2)}| \leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\overline{M}_{16})^{(2)}s_{(16)}} e^{(\overline{M}_{16})^{(2)}s_{(16)}} ds_{(16)} + \int_0^t \{ (a_{16}')^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\overline{M}_{16})^{(2)}s_{(16)}} e^{-(\overline{M}_{16})^{(2)}s_{(16)}} + (a_{16}'')^{(2)} (T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\overline{M}_{16})^{(2)}s_{(16)}} e^{(\overline{M}_{16})^{(2)}s_{(16)}} + G_{16}^{(2)} | (a_{16}'')^{(2)} (T_{17}^{(1)}, s_{(16)}) - (a_{16}'')^{(2)} (T_{17}^{(2)}, s_{(16)}) | e^{-(\overline{M}_{16})^{(2)}s_{(16)}} e^{(\overline{M}_{16})^{(2)}s_{(16)}} \} ds_{(16)} -303$$

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-304

$$|(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\overline{M}_{16})^{(2)}t} \leq \frac{1}{(\overline{M}_{16})^{(2)}} ((a_{16})^{(2)} + (a_{16}')^{(2)} + (\widehat{A}_{16})^{(2)} + (\widehat{P}_{16})^{(2)} (\widehat{k}_{16})^{(2)}) d((G_{19})^{(1)}, (T_{19})^{(1)}; (G_{19})^{(2)}, (T_{19})^{(2)}) -305$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-306

Remark 1: The fact that we supposed $(a_{16}'')^{(2)}$ and $(b_{16}'')^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{16})^{(2)} e^{(\overline{M}_{16})^{(2)}t}$ and $(\widehat{Q}_{16})^{(2)} e^{(\overline{M}_{16})^{(2)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$, $i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-307

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i')^{(2)} - (a_i'')^{(2)} (T_{17}(s_{(16)}), s_{(16)}) \} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i'')^{(2)}t} > 0 \text{ for } t > 0 -308$$

Definition of $(\overline{M}_{16})^{(2)}_1, (\overline{M}_{16})^{(2)}_2$ and $(\overline{M}_{16})^{(2)}_3$:

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if

$$G_{16} < (\overline{M}_{16})^{(2)} \text{ it follows } \frac{dG_{17}}{dt} \leq ((\overline{M}_{16})^{(2)})_1 - (a_{17}')^{(2)} G_{17} \text{ and by integrating}$$

$$G_{17} \leq ((\overline{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)} ((\overline{M}_{16})^{(2)})_1 / (a_{17}')^{(2)}$$

In the same way, one can obtain

$$G_{18} \leq ((\overline{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)} ((\overline{M}_{16})^{(2)})_2 / (a_{18}')^{(2)}$$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively.-309

310

Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below.-311

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(2)} ((G_{19})(t), t)) = (b_{17}')^{(2)}$ then $T_{17} \rightarrow \infty$.

Definition of $(m)^{(2)}$ and ε_2 :

Indeed let t_2 be so that for $t > t_2$

$$(b_{17})^{(2)} - (b_i'')^{(2)} ((G_{19})(t), t) < \varepsilon_2, T_{16}(t) > (m)^{(2)} -312$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)} (m)^{(2)} - \varepsilon_2 T_{17}$ which leads to

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results -313}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{2} \right), t = \log \frac{2}{\varepsilon_2} \text{ By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The same property}$$

holds for T_{18} if $\lim_{t \rightarrow \infty} (b_{18}'')^{(2)} ((G_{19})(t), t) = (b_{18}')^{(2)}$

We now state a more precise theorem about the behaviors at infinity of the solutions -314

-315

It is now sufficient to take $\frac{(a_i)^{(3)}}{(\overline{M}_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(\overline{M}_{20})^{(3)}} < 1$ and to choose

$(\widehat{P}_{20})^{(3)}$ and $(\widehat{Q}_{20})^{(3)}$ large to have-316

$$\frac{(a_i)^{(3)}}{(\overline{M}_{20})^{(3)}} \left[(\widehat{P}_{20})^{(3)} + ((\widehat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\overline{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{20})^{(3)} -317$$

$$\frac{(b_i)^{(3)}}{(\overline{M}_{20})^{(3)}} \left[((\widehat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\overline{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{20})^{(3)} \right] \leq (\widehat{Q}_{20})^{(3)} -318$$

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i into itself-319

The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric

$$d\left(\left((G_{23})^{(1)}, (T_{23})^{(1)}\right), \left((G_{23})^{(2)}, (T_{23})^{(2)}\right)\right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)}t} \right\} - 320$$

Indeed if we denote

Definition of $\widetilde{G}_{23}, \widetilde{T}_{23} : \left((\widetilde{G}_{23}), (\widetilde{T}_{23}) \right) = \mathcal{A}^{(3)}\left((G_{23}), (T_{23}) \right)$ -321

It results

$$\begin{aligned} |\widetilde{G}_{20}^{(1)} - \widetilde{G}_i^{(2)}| &\leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} ds_{(20)} + \\ &\int_0^t \left\{ (a_{20}')^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{-(\bar{M}_{20})^{(3)}s_{(20)}} + \right. \\ &(a_{20}'')^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} + \\ &\left. G_{20}^{(2)} |(a_{20}'')^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a_{20}'')^{(3)} (T_{21}^{(2)}, s_{(20)})| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} \right\} ds_{(20)} \end{aligned}$$

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-322

323

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{20})^{(3)}t} \leq \frac{1}{(\bar{M}_{20})^{(3)}} \left((a_{20})^{(3)} + (a_{20}')^{(3)} + (\bar{A}_{20})^{(3)} + (\bar{P}_{20})^{(3)} (\bar{k}_{20})^{(3)} \right) d\left(\left((G_{23})^{(1)}, (T_{23})^{(1)}\right); \left((G_{23})^{(2)}, (T_{23})^{(2)}\right)\right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-324

Remark 1: The fact that we supposed $(a_{20}'')^{(3)}$ and $(b_{20}'')^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ and $(\bar{Q}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(3)}$ and $(b_i'')^{(3)}$, $i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-325

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(3)} - (a_i'')^{(3)}\} (T_{21}(s_{(20)}), s_{(20)}) ds_{(20)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(3)}t} > 0 \text{ for } t > 0 \text{-326}$$

Definition of $((\bar{M}_{20})^{(3)})_1, ((\bar{M}_{20})^{(3)})_2$ and $((\bar{M}_{20})^{(3)})_3$:

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$$G_{20} < (\bar{M}_{20})^{(3)} \text{ it follows } \frac{dG_{21}}{dt} \leq ((\bar{M}_{20})^{(3)})_1 - (a_{21}')^{(3)} G_{21} \text{ and by integrating}$$

$$G_{21} \leq ((\bar{M}_{20})^{(3)})_2 = G_{21}^0 + 2(a_{21})^{(3)} ((\bar{M}_{20})^{(3)})_1 / (a_{21}')^{(3)}$$

In the same way, one can obtain

$$G_{22} \leq ((\bar{M}_{20})^{(3)})_3 = G_{22}^0 + 2(a_{22})^{(3)} ((\bar{M}_{20})^{(3)})_2 / (a_{22}')^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively.-327

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below.-328

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(3)}) ((G_{23})(t), t) = (b_{21}')^{(3)}$ then $T_{21} \rightarrow \infty$.

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$

$$(b_{21}')^{(3)} - (b_i'')^{(3)} ((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)} \text{-329}$$

330

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)} (m)^{(3)} - \varepsilon_3 T_{21}$ which leads to

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{2} \right), t = \log \frac{2}{\varepsilon_3} \text{ By taking now } \varepsilon_3 \text{ sufficiently small one sees that } T_{21} \text{ is unbounded. The same property}$$

holds for T_{22} if $\lim_{t \rightarrow \infty} ((b_{22}'')^{(3)}) ((G_{23})(t), t) = (b_{22}')^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions -331

-332

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} < 1$ and to choose

$(\bar{P}_{24})^{(4)}$ and $(\bar{Q}_{24})^{(4)}$ large to have-333

$$\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}} \left[(\bar{P}_{24})^{(4)} + ((\bar{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\bar{P}_{24})^{(4)} + G_j^0}{G_j^0} \right)} \right] \leq (\bar{P}_{24})^{(4)} \text{-334}$$

$$\frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[((\widehat{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{24})^{(4)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{24})^{(4)} \right] \leq (\widehat{Q}_{24})^{(4)} - 335$$

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i satisfying IN to itself-336
 The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric

$$d\left(((G_{27})^{(1)}, (T_{27})^{(1)}), ((G_{27})^{(2)}, (T_{27})^{(2)}) \right) = \sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t} \}$$

Indeed if we denote

$$\text{Definition of } (\widehat{G}_{27}), (\widehat{T}_{27}) : ((\widehat{G}_{27}), (\widehat{T}_{27})) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$$

It results

$$\begin{aligned} |\widehat{G}_{24}^{(1)} - \widehat{G}_{24}^{(2)}| &\leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} ds(24) + \\ &\int_0^t \{ (a'_{24})^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{-(\widehat{M}_{24})^{(4)}s(24)} + \\ &(a''_{24})^{(4)} (T_{25}^{(1)}, s(24)) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} + \\ &G_{24}^{(2)} |(a''_{24})^{(4)} (T_{25}^{(1)}, s(24)) - (a''_{24})^{(4)} (T_{25}^{(2)}, s(24))| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} \} ds(24) \end{aligned}$$

Where $s(24)$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-337

38

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\widehat{M}_{24})^{(4)}t} \leq \frac{1}{(\widehat{M}_{24})^{(4)}} ((a_{24})^{(4)} + (a'_{24})^{(4)} + (\widehat{A}_{24})^{(4)} + (\widehat{P}_{24})^{(4)} (\widehat{k}_{24})^{(4)}) d\left(((G_{27})^{(1)}, (T_{27})^{(1)}); ((G_{27})^{(2)}, (T_{27})^{(2)}) \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-339

Remark 1: The fact that we supposed $(a''_{24})^{(4)}$ and $(b''_{24})^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ and $(\widehat{Q}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(4)}$ and $(b_i'')^{(4)}$, $i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-340

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i')^{(4)} - (a_i'')^{(4)} (T_{25}(s(24)), s(24)) \} ds(24)} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(4)}t} > 0 \text{ for } t > 0 -341$$

Definition of $((\widehat{M}_{24})^{(4)})_1, ((\widehat{M}_{24})^{(4)})_2$ and $((\widehat{M}_{24})^{(4)})_3$:

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$$G_{24} < (\widehat{M}_{24})^{(4)} \text{ it follows } \frac{dG_{25}}{dt} \leq ((\widehat{M}_{24})^{(4)})_1 - (a_{25}')^{(4)} G_{25} \text{ and by integrating}$$

$$G_{25} \leq ((\widehat{M}_{24})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)} ((\widehat{M}_{24})^{(4)})_1 / (a_{25}')^{(4)}$$

In the same way, one can obtain

$$G_{26} \leq ((\widehat{M}_{24})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)} ((\widehat{M}_{24})^{(4)})_2 / (a_{26}')^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24} , G_{26} and G_{24} , G_{25} respectively.-342

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below.-343

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(4)} ((G_{27})(t), t)) = (b_{25}')^{(4)}$ then $T_{25} \rightarrow \infty$.

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25}')^{(4)} - (b_i'')^{(4)} ((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)} - 344$$

Then $\frac{dT_{25}}{dt} \geq (a_{25}')^{(4)} (m)^{(4)} - \varepsilon_4 T_{25}$ which leads to

$$T_{25} \geq \left(\frac{(a_{25}')^{(4)} (m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$$T_{25} \geq \left(\frac{(a_{25}')^{(4)} (m)^{(4)}}{2} \right), t = \log \frac{2}{\varepsilon_4} \text{ By taking now } \varepsilon_4 \text{ sufficiently small one sees that } T_{25} \text{ is unbounded. The same property}$$

holds for T_{26} if $\lim_{t \rightarrow \infty} (b_{26}')^{(4)} ((G_{27})(t), t) = (b_{26}')^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ANALOGOUS inequalities hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$ -345

-346

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\overline{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\overline{M}_{28})^{(5)}} < 1$ and to choose $(\widehat{P}_{28})^{(5)}$ and $(\widehat{Q}_{28})^{(5)}$ large to have
 -347

$$\frac{(a_i)^{(5)}}{(\overline{M}_{28})^{(5)}} \left[(\widehat{P}_{28})^{(5)} + ((\widehat{P}_{28})^{(5)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{28})^{(5)} + G_j^0}{G_j^0}\right)} \right] \leq (\widehat{P}_{28})^{(5)} \quad -348$$

$$\frac{(b_i)^{(5)}}{(\overline{M}_{28})^{(5)}} \left[((\widehat{Q}_{28})^{(5)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{28})^{(5)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{28})^{(5)} \right] \leq (\widehat{Q}_{28})^{(5)} \quad -349$$

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i into itself-350

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric

$$d \left(((G_{31})^{(1)}, (T_{31})^{(1)}), ((G_{31})^{(2)}, (T_{31})^{(2)}) \right) = \sup \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\overline{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\overline{M}_{28})^{(5)}t} \right\}$$

Indeed if we denote

$$\text{Definition of } (\overline{G}_{31}), (\overline{T}_{31}) : ((\overline{G}_{31}), (\overline{T}_{31})) = \mathcal{A}^{(5)}((G_{31}), (T_{31}))$$

It results

$$\begin{aligned} |\overline{G}_{28}^{(1)} - \overline{G}_{28}^{(2)}| &\leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\overline{M}_{28})^{(5)}s_{(28)}} e^{(\overline{M}_{28})^{(5)}s_{(28)}} ds_{(28)} + \\ &\int_0^t \{ (a_{28}')^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\overline{M}_{28})^{(5)}s_{(28)}} e^{-(\overline{M}_{28})^{(5)}s_{(28)}} + \\ &(a_{28}'')^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\overline{M}_{28})^{(5)}s_{(28)}} e^{(\overline{M}_{28})^{(5)}s_{(28)}} + \\ &G_{28}^{(2)} | (a_{28}'')^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a_{28}'')^{(5)} (T_{29}^{(2)}, s_{(28)}) | e^{-(\overline{M}_{28})^{(5)}s_{(28)}} e^{(\overline{M}_{28})^{(5)}s_{(28)}} \} ds_{(28)} \end{aligned}$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-351

352

$$\begin{aligned} |(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\overline{M}_{28})^{(5)}t} &\leq \\ \frac{1}{(\overline{M}_{28})^{(5)}} &((a_{28})^{(5)} + (a_{28}')^{(5)} + (\overline{A}_{28})^{(5)} + (\widehat{P}_{28})^{(5)} (\widehat{k}_{28})^{(5)}) d \left(((G_{31})^{(1)}, (T_{31})^{(1)}); (G_{31})^{(2)}, (T_{31})^{(2)} \right) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows-353

Remark 1: The fact that we supposed $(a_{28}'')^{(5)}$ and $(b_{28}'')^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\overline{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\overline{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(5)}$ and $(b_i'')^{(5)}, i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-354

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i')^{(5)} - (a_i'')^{(5)} (T_{29}(s_{(28)}), s_{(28)}) \} ds_{(28)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(5)}t} > 0 \text{ for } t > 0 \quad -355$$

Definition of $(\overline{M}_{28})^{(5)}_1, (\overline{M}_{28})^{(5)}_2$ and $(\overline{M}_{28})^{(5)}_3$:

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$$G_{28} < (\overline{M}_{28})^{(5)} \text{ it follows } \frac{dG_{29}}{dt} \leq ((\overline{M}_{28})^{(5)})_1 - (a_{29}')^{(5)} G_{29} \text{ and by integrating}$$

$$G_{29} \leq ((\overline{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29})^{(5)} ((\overline{M}_{28})^{(5)})_1 / (a_{29}')^{(5)}$$

In the same way, one can obtain

$$G_{30} \leq ((\overline{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30})^{(5)} ((\overline{M}_{28})^{(5)})_2 / (a_{30}')^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28}, G_{30} and G_{28}, G_{29} respectively.-356

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below.-357

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(5)} ((G_{31})(t), t)) = (b_{29}')^{(5)}$ then $T_{29} \rightarrow \infty$.

Definition of $(m)^{(5)}$ and ε_5 :

Indeed let t_5 be so that for $t > t_5$

$$(b_{29})^{(5)} - (b_i'')^{(5)} ((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)} \quad -358$$

359

Then $\frac{dT_{29}}{dt} \geq (a_{29})^{(5)}(m)^{(5)} - \varepsilon_5 T_{29}$ which leads to

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t}$$

If we take t such that $e^{-\varepsilon_5 t} = \frac{1}{2}$ it results

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_5}$$

By taking now ε_5 sufficiently small one sees that T_{29} is unbounded. The same property holds for T_{30} if $\lim_{t \rightarrow \infty} (b_{30}'')^{(5)}((G_{31})(t), t) = (b_{30}')^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$ -360

-361

It is now sufficient to take $\frac{(a_i)^{(6)}}{(\bar{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\bar{M}_{32})^{(6)}} < 1$ and to choose

$(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ large to have -362

$$\frac{(a_i)^{(6)}}{(\bar{M}_{32})^{(6)}} \left[(\hat{P}_{32})^{(6)} + ((\hat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\hat{P}_{32})^{(6)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{32})^{(6)} \quad -363$$

$$\frac{(b_i)^{(6)}}{(\bar{M}_{32})^{(6)}} \left[((\hat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{32})^{(6)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{32})^{(6)} \right] \leq (\hat{Q}_{32})^{(6)} \quad -364$$

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i into itself -365

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric

$$d \left(((G_{35})^{(1)}, (T_{35})^{(1)}), ((G_{35})^{(2)}, (T_{35})^{(2)}) \right) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{32})^{(6)}t} \}$$

Indeed if we denote

$$\text{Definition of } (\widehat{G_{35}}, \widehat{T_{35}}) : (\widehat{G_{35}}, \widehat{T_{35}}) = \mathcal{A}^{(6)}((G_{35}), (T_{35}))$$

It results

$$\begin{aligned} |\widehat{G}_{32}^{(1)} - \widehat{G}_{32}^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(\bar{M}_{32})^{(6)}s_{(32)}} e^{(\bar{M}_{32})^{(6)}s_{(32)}} ds_{(32)} + \\ &\int_0^t \{ (a_{32}')^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\bar{M}_{32})^{(6)}s_{(32)}} e^{-(\bar{M}_{32})^{(6)}s_{(32)}} + \\ &(a_{32}'')^{(6)} (T_{33}^{(1)}, s_{(32)}) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\bar{M}_{32})^{(6)}s_{(32)}} e^{(\bar{M}_{32})^{(6)}s_{(32)}} + \\ &G_{32}^{(2)} |(a_{32}'')^{(6)} (T_{33}^{(1)}, s_{(32)}) - (a_{32}'')^{(6)} (T_{33}^{(2)}, s_{(32)})| e^{-(\bar{M}_{32})^{(6)}s_{(32)}} e^{(\bar{M}_{32})^{(6)}s_{(32)}} \} ds_{(32)} \end{aligned}$$

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows -366

367

$$(1) \quad (a_i')^{(1)}, (a_i'')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (b_i'')^{(1)} > 0, \\ i, j = 13, 14, 15$$

(2) The functions $(a_i'')^{(1)}, (b_i'')^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a_i'')^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}$$

$$(3) \lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)}$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants

and $i = 13, 14, 15$

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T_{14}, t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T_{14} - T'_{14}| e^{-(\hat{M}_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, T)| < (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(\hat{M}_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(1)}(T'_{14}, t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(V) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(W) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$|(G_{35})^{(1)} - (G_{35})^{(2)}| e^{-(\hat{M}_{32})^{(6)}t} \leq \frac{1}{(\hat{M}_{32})^{(6)}} ((a_{32})^{(6)} + (a'_{32})^{(6)} + (\hat{A}_{32})^{(6)} + (\hat{P}_{32})^{(6)} (\hat{k}_{32})^{(6)}) d((G_{35})^{(1)}, (T_{35})^{(1)}; (G_{35})^{(2)}, (T_{35})^{(2)}) \quad 368$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

NOTE: SIMILAR ANALYSIS FOLLOWS FOR MODULE SEVEN

Remark 1: The fact that we supposed $(a_{32}'')^{(6)}$ and $(b_{32}'')^{(6)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}$ and $(\hat{Q}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}$ respectively of \mathbb{R}_+ . 369

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(6)}$ and $(b_i'')^{(6)}, i = 32, 33, 34$ depend only on T_{33} and respectively on (G_{35}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 370

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(6)} - (a_i'')^{(6)}(T_{33}(s_{(32)}), s_{(32)})\} ds_{(32)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(6)}t} > 0 \text{ for } t > 0$$

Definition of $(\hat{M}_{32})^{(6)}_1, (\hat{M}_{32})^{(6)}_2$ and $(\hat{M}_{32})^{(6)}_3$: 371

Remark 3: if G_{32} is bounded, the same property have also G_{33} and G_{34} . indeed if

$$G_{32} < (\hat{M}_{32})^{(6)} \text{ it follows } \frac{dG_{33}}{dt} \leq ((\hat{M}_{32})^{(6)})_1 - (a'_{33})^{(6)} G_{33} \text{ and by integrating}$$

$$G_{33} \leq ((\hat{M}_{32})^{(6)})_2 = G_{33}^0 + 2(a_{33})^{(6)} ((\hat{M}_{32})^{(6)})_1 / (a'_{33})^{(6)}$$

In the same way, one can obtain

$$G_{34} \leq ((\hat{M}_{32})^{(6)})_3 = G_{34}^0 + 2(a_{34})^{(6)} ((\hat{M}_{32})^{(6)})_2 / (a'_{34})^{(6)}$$

If G_{33} or G_{34} is bounded, the same property follows for G_{32} , G_{34} and G_{32} , G_{33} respectively.

Remark 4: If G_{32} is bounded, from below, the same property holds for G_{33} and G_{34} . The proof is analogous with the preceding one. An analogous property is true if G_{33} is bounded from below. 372

Remark 5: If T_{32} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(6)}((G_{35})(t), t)) = (b_{33}')^{(6)}$ then $T_{33} \rightarrow \infty$. 373

Definition of $(m)^{(6)}$ and ε_6 :

Indeed let t_6 be so that for $t > t_6$

$$(b_{33})^{(6)} - (b_i'')^{(6)}((G_{35})(t), t) < \varepsilon_6, T_{32}(t) > (m)^{(6)}$$

374
375

Then $\frac{dT_{33}}{dt} \geq (a_{33})^{(6)}(m)^{(6)} - \varepsilon_6 T_{33}$ which leads to

$$T_{33} \geq \left(\frac{(a_{33})^{(6)}(m)^{(6)}}{\varepsilon_6} \right) (1 - e^{-\varepsilon_6 t}) + T_{33}^0 e^{-\varepsilon_6 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_6 t} = \frac{1}{2} \text{ it results}$$

$$T_{33} \geq \left(\frac{(a_{33})^{(6)}(m)^{(6)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_6} \text{ By taking now } \varepsilon_6 \text{ sufficiently small one sees that } T_{33} \text{ is unbounded. The}$$

same property holds for T_{34} if $\lim_{t \rightarrow \infty} ((b_{34}'')^{(6)}((G_{35})(t), t(t), t)) = (b_{34}')^{(6)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

(e) The operator $\mathcal{A}^{(7)}$ maps the space of functions satisfying 37,35,36 into itself .Indeed it is obvious that 376

$$G_{36}(t) \leq G_{36}^0 + \int_0^t \left[(a_{36})^{(7)} \left(G_{37}^0 + (\hat{P}_{36})^{(7)} e^{(\hat{M}_{36})^{(7)} s_{(36)}} \right) \right] ds_{(36)} = \\ (1 + (a_{36})^{(7)} t) G_{37}^0 + \frac{(a_{36})^{(7)} (\hat{P}_{36})^{(7)}}{(\hat{M}_{36})^{(7)}} \left(e^{(\hat{M}_{36})^{(7)} t} - 1 \right)$$

377

From which it follows that

$$(G_{36}(t) - G_{36}^0) e^{-(\hat{M}_{36})^{(7)} t} \leq \frac{(a_{36})^{(7)}}{(\hat{M}_{36})^{(7)}} \left[((\hat{P}_{36})^{(7)} + G_{37}^0) e^{-\left(\frac{(\hat{P}_{36})^{(7)} + G_{37}^0}{G_{37}^0} \right)} + (\hat{P}_{36})^{(7)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{37}, G_{38}, T_{36}, T_{37}, T_{38}$

378

It is now sufficient to take $\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}}, \frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} < 1$ and to choose

$(\hat{P}_{36})^{(7)}$ and $(\hat{Q}_{36})^{(7)}$ large to have

$$\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[(\hat{P}_{36})^{(7)} + ((\hat{P}_{36})^{(7)} + G_j^0) e^{-\left(\frac{(\hat{P}_{36})^{(7)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{36})^{(7)}$$

379

$$\frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[((\hat{Q}_{36})^{(7)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{36})^{(7)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{36})^{(7)} \right] \leq (\hat{Q}_{36})^{(7)}$$

380

In order that the operator $\mathcal{A}^{(7)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS AND ITS CONCOMITANT CONDITIONALITIES into itself 381

The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric

382
383

$$d \left(((G_{39})^{(1)}, (T_{39})^{(1)}), ((G_{39})^{(2)}, (T_{39})^{(2)}) \right) = \\ \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\hat{M}_{36})^{(7)} t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\hat{M}_{36})^{(7)} t} \right\}$$

Indeed if we denote

Definition of $(\widetilde{G}_{39}), (\widetilde{T}_{39})$:

$$((\widetilde{G}_{39}), (\widetilde{T}_{39})) = \mathcal{A}^{(7)}((G_{39}), (T_{39}))$$

It results

$$|\tilde{G}_{36}^{(1)} - \tilde{G}_i^{(2)}| \leq \int_0^t (a_{36})^{(7)} |G_{37}^{(1)} - G_{37}^{(2)}| e^{-(\bar{M}_{36})^{(7)} s_{(36)}} e^{(\bar{M}_{36})^{(7)} s_{(36)}} ds_{(36)} + \int_0^t \{ (a'_{36})^{(7)} |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\bar{M}_{36})^{(7)} s_{(36)}} e^{-(\bar{M}_{36})^{(7)} s_{(36)}} + (a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\bar{M}_{36})^{(7)} s_{(36)}} e^{(\bar{M}_{36})^{(7)} s_{(36)}} + G_{36}^{(2)} | (a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) - (a''_{36})^{(7)} (T_{37}^{(2)}, s_{(36)}) | e^{-(\bar{M}_{36})^{(7)} s_{(36)}} e^{(\bar{M}_{36})^{(7)} s_{(36)}} \} ds_{(36)}$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

384

$$|(G_{39})^{(1)} - (G_{39})^{(2)}| e^{-(\bar{M}_{36})^{(7)} t} \leq \frac{1}{(\bar{M}_{36})^{(7)}} ((a_{36})^{(7)} + (a'_{36})^{(7)} + (\bar{A}_{36})^{(7)} + (\bar{P}_{36})^{(7)} (\bar{k}_{36})^{(7)}) d((G_{39})^{(1)}, (T_{39})^{(1)}; (G_{39})^{(2)}, (T_{39})^{(2)})$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (37,35,36) the result follows

Remark 1: The fact that we supposed $(a''_{36})^{(7)}$ and $(b''_{36})^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{36})^{(7)} e^{(\bar{M}_{36})^{(7)} t}$ and $(\bar{Q}_{36})^{(7)} e^{(\bar{M}_{36})^{(7)} t}$ respectively of \mathbb{R}_+ . 385

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(7)}$ and $(b''_i)^{(7)}$, $i = 36, 37, 38$ depend only on T_{37} and respectively on (G_{39}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition. 386

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From CONCATENATED GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(7)} - (a''_i)^{(7)} (T_{37}(s_{(36)}), s_{(36)}) \} ds_{(36)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(7)} t} > 0 \text{ for } t > 0$$

Definition of $((\bar{M}_{36})^{(7)})_1, ((\bar{M}_{36})^{(7)})_2$ and $((\bar{M}_{36})^{(7)})_3$: 387

Remark 3: if G_{36} is bounded, the same property have also G_{37} and G_{38} . indeed if

$$G_{36} < (\bar{M}_{36})^{(7)} \text{ it follows } \frac{dG_{37}}{dt} \leq ((\bar{M}_{36})^{(7)})_1 - (a'_{37})^{(7)} G_{37} \text{ and by integrating}$$

$$G_{37} \leq ((\bar{M}_{36})^{(7)})_2 = G_{37}^0 + 2(a_{37})^{(7)} ((\bar{M}_{36})^{(7)})_1 / (a'_{37})^{(7)}$$

In the same way, one can obtain

$$G_{38} \leq ((\bar{M}_{36})^{(7)})_3 = G_{38}^0 + 2(a_{38})^{(7)} ((\bar{M}_{36})^{(7)})_2 / (a'_{38})^{(7)}$$

If G_{37} or G_{38} is bounded, the same property follows for G_{36} , G_{38} and G_{36} , G_{37} respectively.

Remark 7: If G_{36} is bounded, from below, the same property holds for G_{37} and G_{38} . The proof is analogous with the preceding one. An analogous property is true if G_{37} is bounded from below. 388

Remark 5: If T_{36} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(7)} ((G_{39})(t), t)) = (b'_{37})^{(7)}$ then $T_{37} \rightarrow \infty$. 389

Definition of $(m)^{(7)}$ and ε_7 :

Indeed let t_7 be so that for $t > t_7$

$$(b_{37})^{(7)} - (b'_i)^{(7)} ((G_{39})(t), t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)} (m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 390

$$T_{37} \geq \left(\frac{(a_{37})^{(7)} (m)^{(7)}}{\varepsilon_7} \right) (1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_7 t} = \frac{1}{2} \text{ it results}$$

$$T_{37} \geq \left(\frac{(a_{37})^{(7)} (m)^{(7)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_7} \text{ By taking now } \varepsilon_7 \text{ sufficiently small one sees that } T_{37} \text{ is unbounded. The}$$

same property holds for T_{38} if $\lim_{t \rightarrow \infty} (b''_{38})^{(7)} ((G_{39})(t), t) = (b'_{38})^{(7)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

$$-(\sigma_2)^{(2)} \leq -(a'_{16})^{(2)} + (a'_{17})^{(2)} - (a''_{16})^{(2)}(T_{17}, t) + (a''_{17})^{(2)}(T_{17}, t) \leq -(\sigma_1)^{(2)} \quad 391$$

$$-(\tau_2)^{(2)} \leq -(b'_{16})^{(2)} + (b'_{17})^{(2)} - (b''_{16})^{(2)}(G_{19}, t) - (b''_{17})^{(2)}(G_{19}, t) \leq -(\tau_1)^{(2)} \quad 392$$

Definition of $(v_1)^{(2)}, (v_2)^{(2)}, (u_1)^{(2)}, (u_2)^{(2)}$: 393

By $(v_1)^{(2)} > 0, (v_2)^{(2)} < 0$ and respectively $(u_1)^{(2)} > 0, (u_2)^{(2)} < 0$ the roots 394

(a) of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ 395

and $(b_{14})^{(2)}(u^{(2)})^2 + (\tau_1)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ and 396

roots of the equations $(a_{37})^{(7)} (v^{(7)})^2 + (\sigma_2)^{(7)} v^{(7)} - (a_{36})^{(7)} = 0$

and $(b_{37})^{(7)} (u^{(7)})^2 + (\tau_2)^{(7)} u^{(7)} - (b_{36})^{(7)} = 0$

Definition of $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}, (v_0)^{(7)}$:-

(o) If we define $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}$ by

$$(m_2)^{(7)} = (v_0)^{(7)}, (m_1)^{(7)} = (v_1)^{(7)}, \text{ if } (v_0)^{(7)} < (v_1)^{(7)}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (\bar{v}_1)^{(7)}, \text{ if } (v_1)^{(7)} < (v_0)^{(7)} < (\bar{v}_1)^{(7)},$$

$$\text{and } \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$$

$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (v_0)^{(7)}, \text{ if } (\bar{v}_1)^{(7)} < (v_0)^{(7)}$
 and analogously

483

$$(\mu_2)^{(7)} = (u_0)^{(7)}, (\mu_1)^{(7)} = (u_1)^{(7)}, \text{ if } (u_0)^{(7)} < (u_1)^{(7)}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (\bar{u}_1)^{(7)}, \text{ if } (u_1)^{(7)} < (u_0)^{(7)} < (\bar{u}_1)^{(7)},$$

$$\text{and } \boxed{(u_0)^{(7)} = \frac{T_{36}^0}{T_{37}^0}}$$

$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (u_0)^{(7)}, \text{ if } (\bar{u}_1)^{(7)} < (u_0)^{(7)}$ where $(u_1)^{(7)}, (\bar{u}_1)^{(7)}$
 are defined respectively

Then the solution satisfies the inequalities

484

$$G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{36}(t) \leq G_{36}^0 e^{(S_1)^{(7)}t}$$

where $(p_i)^{(7)}$ is defined

$$\frac{1}{(m_7)^{(7)}} G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{37}(t) \leq \frac{1}{(m_2)^{(7)}} G_{36}^0 e^{(S_1)^{(7)}t}$$

485
486

$$\left(\frac{(a_{38})^{(7)} G_{36}^0}{(m_1)^{(7)} ((S_1)^{(7)} - (p_{36})^{(7)} - (S_2)^{(7)})} \left[e^{((S_1)^{(7)} - (p_{36})^{(7)})t} - e^{-(S_2)^{(7)}t} \right] + G_{38}^0 e^{-(S_2)^{(7)}t} \leq G_{38}(t) \leq \frac{(a_{38})^{(7)} G_{36}^0}{(m_2)^{(7)} ((S_1)^{(7)} - (a'_{38})^{(7)})} \left[e^{(S_1)^{(7)}t} - e^{-(a'_{38})^{(7)}t} \right] + G_{38}^0 e^{-(a'_{38})^{(7)}t} \right)$$

487

$$\boxed{T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

488

$$\frac{1}{(\mu_1)^{(7)}} T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq \frac{1}{(\mu_2)^{(7)}} T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

489

$$\frac{(b_{38})^{(7)} T_{36}^0}{(\mu_1)^{(7)} ((R_1)^{(7)} - (b'_{38})^{(7)})} \left[e^{(R_1)^{(7)}t} - e^{-(b'_{38})^{(7)}t} \right] + T_{38}^0 e^{-(b'_{38})^{(7)}t} \leq T_{38}(t) \leq$$

490

$$\frac{(a_{38})^{(7)} T_{36}^0}{(\mu_2)^{(7)} ((R_1)^{(7)} + (r_{36})^{(7)} + (R_2)^{(7)})} \left[e^{((R_1)^{(7)} + (r_{36})^{(7)})t} - e^{-(R_2)^{(7)}t} \right] + T_{38}^0 e^{-(R_2)^{(7)}t}$$

Definition of $(S_1)^{(7)}, (S_2)^{(7)}, (R_1)^{(7)}, (R_2)^{(7)}$:-

491

Where $(S_1)^{(7)} = (a_{36})^{(7)}(m_2)^{(7)} - (a'_{36})^{(7)}$

$$(S_2)^{(7)} = (a_{38})^{(7)} - (p_{38})^{(7)}$$

$$(R_1)^{(7)} = (b_{36})^{(7)}(\mu_2)^{(7)} - (b'_{36})^{(7)}$$

$$(R_2)^{(7)} = (b'_{38})^{(7)} - (r_{38})^{(7)}$$

From GLOBAL EQUATIONS we obtain

492

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37}, t) \right) -$$

$$(a_{37}'')^{(7)}(T_{37}, t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:-
$$v^{(7)} = \frac{G_{36}}{G_{37}}$$

It follows

$$-\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} \right) \leq \frac{dv^{(7)}}{dt} \leq -\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

(a) For $0 < \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \geq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}, \quad \boxed{(C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}$$

it follows $(v_0)^{(7)} \leq v^{(7)}(t) \leq (v_1)^{(7)}$

In the same manner , we get

493

$$v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}, \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}$$

From which we deduce $(v_0)^{(7)} \leq v^{(7)}(t) \leq (\bar{v}_1)^{(7)}$

(b) If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{v}_1)^{(7)}$ we find like in the previous case,

494

$$(v_1)^{(7)} \leq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}} \leq v^{(7)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (\bar{v}_1)^{(7)}$$

(c) If $0 < (v_1)^{(7)} \leq (\bar{v}_1)^{(7)} \leq \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$, we obtain

495

$$(v_1)^{(7)} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (v_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad \boxed{v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:-

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}$, then $(\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(v_1)^{(7)} = (\bar{v}_1)^{(7)}$ if in addition $(v_0)^{(7)} = (v_1)^{(7)}$ then $v^{(7)}(t) = (v_0)^{(7)}$ and as a consequence $G_{36}(t) = (v_0)^{(7)}G_{37}(t)$ **this also defines $(v_0)^{(7)}$ for the special case .**

Analogously if $(b''_{36})^{(7)} = (b''_{37})^{(7)}$, then $(\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then $(u_1)^{(7)} = (\bar{u}_1)^{(7)}$ if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(v_1)^{(7)}$ and $(\bar{v}_1)^{(7)}$, **and definition of $(u_0)^{(7)}$.**

We can prove the following

If $(a''_i)^{(7)}$ and $(b''_i)^{(7)}$ are independent on t , and the conditions

$$(a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} < 0$$

$$(a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a_{36})^{(7)}(p_{36})^{(7)} + (a'_{37})^{(7)}(p_{37})^{(7)} + (p_{36})^{(7)}(p_{37})^{(7)} > 0$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} > 0,$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - (b'_{36})^{(7)}(r_{37})^{(7)} - (b'_{37})^{(7)}(r_{37})^{(7)} + (r_{36})^{(7)}(r_{37})^{(7)} < 0$$

with $(p_{36})^{(7)}, (r_{37})^{(7)}$ as defined are satisfied, then the system WITH THE SATISFACTION OF THE FOLLOWING PROPERTIES HAS A SOLUTION AS DERIVED BELOW.

Particular case :

If $(a''_{16})^{(2)} = (a''_{17})^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)}G_{17}(t)$

Analogously if $(b''_{16})^{(2)} = (b''_{17})^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)}T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a'_{20})^{(3)} - (a'_{21})^{(3)} + (a''_{20})^{(3)}(T_{21}, t) \right) - (a''_{21})^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)}$$

Definition of $v^{(3)}$:-
$$v^{(3)} = \frac{G_{20}}{G_{21}}$$

It follows

$$- \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)} \right) \leq \frac{dv^{(3)}}{dt} \leq - \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)} \right)$$

From which one obtains

(a) For $0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_0)^{(3)}]t}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_0)^{(3)}]t}}, \quad (C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}$$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$

In the same manner, we get

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}, \quad (\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}$$

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case,

$$(v_1)^{(3)} \leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_2)^{(3)}]t}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_2)^{(3)}]t}} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}} \leq (\bar{v}_1)^{(3)}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain 505

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)} (\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)} (\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}] t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)} (\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}] t}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{20}'')^{(3)} = (a_{21}'')^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)} G_{21}(t)$

Analogously if $(b_{20}'')^{(3)} = (b_{21}'')^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)} T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$

: From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a_{24}')^{(4)} - (a_{25}')^{(4)} + (a_{24}'')^{(4)} (T_{25}, t) \right) - (a_{25}'')^{(4)} (T_{25}, t) v^{(4)} - (a_{25})^{(4)} v^{(4)}$$

Definition of $v^{(4)}$:-

$$v^{(4)} = \frac{G_{24}}{G_{25}}$$

It follows

$$- \left((a_{25})^{(4)} (v^{(4)})^2 + (\sigma_2)^{(4)} v^{(4)} - (a_{24})^{(4)} \right) \leq \frac{dv^{(4)}}{dt} \leq - \left((a_{25})^{(4)} (v^{(4)})^2 + (\sigma_4)^{(4)} v^{(4)} - (a_{24})^{(4)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \frac{G_{24}^0}{G_{25}^0} < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)} (v_2)^{(4)} e^{[-(a_{25})^{(4)} ((v_1)^{(4)} - (v_0)^{(4)}) t]}}{4 + (C)^{(4)} e^{[-(a_{25})^{(4)} ((v_1)^{(4)} - (v_0)^{(4)}) t]}} , \quad (C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}}$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner, we get

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)} (\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)} ((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}) t]}}{4 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)} ((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}) t]}} , \quad (\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case, 510

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)} (v_2)^{(4)} e^{[-(a_{25})^{(4)} ((v_1)^{(4)} - (v_2)^{(4)}) t]}}{1 + (C)^{(4)} e^{[-(a_{25})^{(4)} ((v_1)^{(4)} - (v_2)^{(4)}) t]}} \leq v^{(4)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)} (\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)} ((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}) t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)} ((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}) t]}} \leq (\bar{v}_1)^{(4)}$$

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \boxed{(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$, we obtain

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (C)^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}}{1 + (C)^{(4)} e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(4)}(t)$:-

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)}, \quad \boxed{v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t)$:-

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{24}'')^{(4)} = (a_{25}'')^{(4)}$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case .**

Analogously if $(b_{24}'')^{(4)} = (b_{25}'')^{(4)}$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then $(u_1)^{(4)} = (\bar{u}_4)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)}$:- $\boxed{v^{(5)} = \frac{G_{28}}{G_{29}}}$

It follows

$$- \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)} \right) \leq \frac{dv^{(5)}}{dt} \leq - \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)}$:-

(g) For $0 < \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad \boxed{(C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner, we get

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{c})^{(5)} (\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}}{5 + (\bar{c})^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}} , \quad \boxed{(\bar{c})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_5)^{(5)}$

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case, 517

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (\bar{c})^{(5)} (v_2)^{(5)} e^{[-(a_{29})^{(5)} (v_1)^{(5)} - (v_2)^{(5)}] t}}{1 + (\bar{c})^{(5)} e^{[-(a_{29})^{(5)} (v_1)^{(5)} - (v_2)^{(5)}] t}} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{c})^{(5)} (\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}}{1 + (\bar{c})^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}} \leq (\bar{v}_1)^{(5)}$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}}$, we obtain 518

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{c})^{(5)} (\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}}{1 + (\bar{c})^{(5)} e^{[-(a_{29})^{(5)} (\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}] t}} \leq (v_0)^{(5)}$$

519

And so with the notation of the first part of condition (c), we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad \boxed{v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad \boxed{u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{28}^{''})^{(5)} = (a_{29}^{''})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)} G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case .**

Analogously if $(b_{28}^{''})^{(5)} = (b_{29}^{''})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then $(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)} T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$.**

we obtain

520
521

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a'_{32})^{(6)} - (a'_{33})^{(6)} + (a''_{32})^{(6)}(T_{33}, t) \right) - (a''_{33})^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $\boxed{v^{(6)} = \frac{G_{32}}{G_{33}}}$

It follows

$$- \left((a_{33})^{(6)} (v^{(6)})^2 + (\sigma_2)^{(6)} v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)} (v^{(6)})^2 + (\sigma_1)^{(6)} v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

(j) For $0 < \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}, \quad \boxed{(C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner , we get

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}, \quad \boxed{(\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

522

523

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case,

524

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}} \leq v^{(6)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (\bar{v}_1)^{(6)}$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}}$, we obtain

525

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)}, \quad \boxed{v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)}, \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{32})^{(6)} = (a''_{33})^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)}G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b''_{32})^{(6)} = (b''_{33})^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then $(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)}T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

526

527

528

We can prove the following

Theorem 3: If $(a''_i)^{(1)}$ and $(b''_i)^{(1)}$ are independent on t , and the conditions

$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} < 0$	
$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} + (a_{13})^{(1)}(p_{13})^{(1)} + (a'_{14})^{(1)}(p_{14})^{(1)} + (p_{13})^{(1)}(p_{14})^{(1)} > 0$	
$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} > 0$,	
$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} - (b'_{13})^{(1)}(r_{14})^{(1)} - (b'_{14})^{(1)}(r_{14})^{(1)} + (r_{13})^{(1)}(r_{14})^{(1)} < 0$	
with $(p_{13})^{(1)}, (r_{14})^{(1)}$ as defined, then the system	529
If $(a''_i)^{(2)}$ and $(b''_i)^{(2)}$ are independent on t , and the conditions	530.
$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} < 0$	531
$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} + (a_{16})^{(2)}(p_{16})^{(2)} + (a'_{17})^{(2)}(p_{17})^{(2)} + (p_{16})^{(2)}(p_{17})^{(2)} > 0$	532
$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} > 0$,	533
$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} - (b'_{16})^{(2)}(r_{17})^{(2)} - (b'_{17})^{(2)}(r_{17})^{(2)} + (r_{16})^{(2)}(r_{17})^{(2)} < 0$	534
with $(p_{16})^{(2)}, (r_{17})^{(2)}$ as defined are satisfied, then the system	
If $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$ are independent on t , and the conditions	535
$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} < 0$	
$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} + (a_{20})^{(3)}(p_{20})^{(3)} + (a'_{21})^{(3)}(p_{21})^{(3)} + (p_{20})^{(3)}(p_{21})^{(3)} > 0$	
$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} > 0$,	
$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} - (b'_{20})^{(3)}(r_{21})^{(3)} - (b'_{21})^{(3)}(r_{21})^{(3)} + (r_{20})^{(3)}(r_{21})^{(3)} < 0$	
with $(p_{20})^{(3)}, (r_{21})^{(3)}$ as defined are satisfied, then the system	
If $(a''_i)^{(4)}$ and $(b''_i)^{(4)}$ are independent on t , and the conditions	536
$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} < 0$	
$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} + (a_{24})^{(4)}(p_{24})^{(4)} + (a'_{25})^{(4)}(p_{25})^{(4)} + (p_{24})^{(4)}(p_{25})^{(4)} > 0$	
$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} > 0$,	
$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - (b'_{24})^{(4)}(r_{25})^{(4)} - (b'_{25})^{(4)}(r_{25})^{(4)} + (r_{24})^{(4)}(r_{25})^{(4)} < 0$	
with $(p_{24})^{(4)}, (r_{25})^{(4)}$ as defined are satisfied, then the system	
If $(a''_i)^{(5)}$ and $(b''_i)^{(5)}$ are independent on t , and the conditions	537
$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} < 0$	
$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} + (a_{28})^{(5)}(p_{28})^{(5)} + (a'_{29})^{(5)}(p_{29})^{(5)} + (p_{28})^{(5)}(p_{29})^{(5)} > 0$	
$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} > 0$,	
$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - (b'_{28})^{(5)}(r_{29})^{(5)} - (b'_{29})^{(5)}(r_{29})^{(5)} + (r_{28})^{(5)}(r_{29})^{(5)} < 0$	
with $(p_{28})^{(5)}, (r_{29})^{(5)}$ as defined satisfied, then the system	
If $(a''_i)^{(6)}$ and $(b''_i)^{(6)}$ are independent on t , and the conditions	538
$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} < 0$	
$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} + (a_{32})^{(6)}(p_{32})^{(6)} + (a'_{33})^{(6)}(p_{33})^{(6)} + (p_{32})^{(6)}(p_{33})^{(6)} > 0$	
$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} > 0$,	
$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - (b'_{32})^{(6)}(r_{33})^{(6)} - (b'_{33})^{(6)}(r_{33})^{(6)} + (r_{32})^{(6)}(r_{33})^{(6)} < 0$	539
with $(p_{32})^{(6)}, (r_{33})^{(6)}$ as defined are satisfied, then the system	
$(a_{13})^{(1)}G_{14} - [(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14})]G_{13} = 0$	540
$(a_{14})^{(1)}G_{13} - [(a'_{14})^{(1)} + (a''_{14})^{(1)}(T_{14})]G_{14} = 0$	541
$(a_{15})^{(1)}G_{14} - [(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14})]G_{15} = 0$	542
$(b_{13})^{(1)}T_{14} - [(b'_{13})^{(1)} - (b''_{13})^{(1)}(G)]T_{13} = 0$	543
$(b_{14})^{(1)}T_{13} - [(b'_{14})^{(1)} - (b''_{14})^{(1)}(G)]T_{14} = 0$	544
$(b_{15})^{(1)}T_{14} - [(b'_{15})^{(1)} - (b''_{15})^{(1)}(G)]T_{15} = 0$	545
has a unique positive solution, which is an equilibrium solution for the system	546
$(a_{16})^{(2)}G_{17} - [(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17})]G_{16} = 0$	547
$(a_{17})^{(2)}G_{16} - [(a'_{17})^{(2)} + (a''_{17})^{(2)}(T_{17})]G_{17} = 0$	548

$(b_{29})^{(5)}T_{28} - [(b'_{29})^{(5)} - (b''_{29})^{(5)}(G_{31})]T_{29} = 0$	573
$(b_{30})^{(5)}T_{29} - [(b'_{30})^{(5)} - (b''_{30})^{(5)}(G_{31})]T_{30} = 0$	574
has a unique positive solution , which is an equilibrium solution for the system	575
$(a_{32})^{(6)}G_{33} - [(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33})]G_{32} = 0$	576
$(a_{33})^{(6)}G_{32} - [(a'_{33})^{(6)} + (a''_{33})^{(6)}(T_{33})]G_{33} = 0$	577
$(a_{34})^{(6)}G_{33} - [(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33})]G_{34} = 0$	578
$(b_{32})^{(6)}T_{33} - [(b'_{32})^{(6)} - (b''_{32})^{(6)}(G_{35})]T_{32} = 0$	579
$(b_{33})^{(6)}T_{32} - [(b'_{33})^{(6)} - (b''_{33})^{(6)}(G_{35})]T_{33} = 0$	580
$(b_{34})^{(6)}T_{33} - [(b'_{34})^{(6)} - (b''_{34})^{(6)}(G_{35})]T_{34} = 0$	584
has a unique positive solution , which is an equilibrium solution for the system	582
$(a_{36})^{(7)}G_{37} - [(a'_{36})^{(7)} + (a''_{36})^{(7)}(T_{37})]G_{36} = 0$	583
$(a_{37})^{(7)}G_{36} - [(a'_{37})^{(7)} + (a''_{37})^{(7)}(T_{37})]G_{37} = 0$	584
$(a_{38})^{(7)}G_{37} - [(a'_{38})^{(7)} + (a''_{38})^{(7)}(T_{37})]G_{38} = 0$	585
$(b_{36})^{(7)}T_{37} - [(b'_{36})^{(7)} - (b''_{36})^{(7)}(G_{39})]T_{36} = 0$	586
	587

$$(b_{37})^{(7)}T_{36} - [(b'_{37})^{(7)} - (b''_{37})^{(7)}(G_{39})]T_{37} = 0 \quad 588$$

$$(b_{38})^{(7)}T_{37} - [(b'_{38})^{(7)} - (b''_{38})^{(7)}(G_{39})]T_{38} = 0 \quad 589$$

has a unique positive solution , which is an equilibrium solution for the system (79 to 36) 560

(a) Indeed the first two equations have a nontrivial solution G_{36}, G_{37} if

$$F(T_{39}) = (a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a'_{36})^{(7)}(a''_{37})^{(7)}(T_{37}) + (a'_{37})^{(7)}(a''_{36})^{(7)}(T_{37}) + (a''_{36})^{(7)}(T_{37})(a''_{37})^{(7)}(T_{37}) = 0$$

Definition and uniqueness of T_{37}^* :- 561

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(7)}(T_{37})$ being increasing, it follows that there exists a unique T_{37}^* for which $f(T_{37}^*) = 0$. With this value , we obtain from the three first equations

$$G_{36} = \frac{(a_{36})^{(7)}G_{37}}{[(a'_{36})^{(7)} + (a''_{36})^{(7)}(T_{37}^*)]} , \quad G_{38} = \frac{(a_{38})^{(7)}G_{37}}{[(a'_{38})^{(7)} + (a''_{38})^{(7)}(T_{37}^*)]}$$

(f) By the same argument, the equations 92,93 admit solutions G_{36}, G_{37} if

$$\varphi(G_{39}) = (b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - [(b_{36})^{(7)}(b''_{37})^{(7)}(G_{39}) + (b_{37})^{(7)}(b''_{36})^{(7)}(G_{39})] + (b''_{36})^{(7)}(G_{39})(b''_{37})^{(7)}(G_{39}) = 0$$

Where in $(G_{39})(G_{36}, G_{37}, G_{38}), G_{36}, G_{38}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{37} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{37}^* such that $\varphi(G^*) = 0$ 562

Finally we obtain the unique solution of 89 to 97

G_{37}^* given by $\varphi((G_{39})^*) = 0, T_{37}^*$ given by $f(T_{37}^*) = 0$ and

$$G_{36}^* = \frac{(a_{36})^{(7)}G_{37}^*}{[(a'_{36})^{(7)} + (a''_{36})^{(7)}(T_{37}^*)]} , \quad G_{38}^* = \frac{(a_{38})^{(7)}G_{37}^*}{[(a'_{38})^{(7)} + (a''_{38})^{(7)}(T_{37}^*)]} \\ T_{36}^* = \frac{(b_{36})^{(7)}T_{37}^*}{[(b_{36})^{(7)} - (b_{36})^{(7)}(G_{39})^*]} , \quad T_{38}^* = \frac{(b_{38})^{(7)}T_{37}^*}{[(b_{38})^{(7)} - (b_{38})^{(7)}(G_{39})^*]} \quad 563$$

Definition and uniqueness of T_{21}^* :- 564

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(1)}(T_{21})$ being increasing, it follows that there exists a unique T_{21}^* for which $f(T_{21}^*) = 0$. With this value , we obtain from the three first equations

$$G_{20} = \frac{(a_{20})^{(3)}G_{21}}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]} , \quad G_{22} = \frac{(a_{22})^{(3)}G_{21}}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]} \quad 565$$

Definition and uniqueness of T_{25}^* :- 566

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(4)}(T_{25})$ being increasing, it follows that there exists a unique T_{25}^* for which $f(T_{25}^*) = 0$. With this value , we obtain from the three first equations

$$G_{24} = \frac{(a_{24})^{(4)}G_{25}}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]} , \quad G_{26} = \frac{(a_{26})^{(4)}G_{25}}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

Definition and uniqueness of T_{29}^* :- 567

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(5)}(T_{29})$ being increasing, it follows that there exists a unique T_{29}^* for which $f(T_{29}^*) = 0$. With this value , we obtain from the three first equations

$$G_{28} = \frac{(a_{28})^{(5)}G_{29}}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]} , \quad G_{30} = \frac{(a_{30})^{(5)}G_{29}}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

Definition and uniqueness of T_{33}^* :- 568

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(6)}(T_{33})$ being increasing, it follows that there exists a unique T_{33}^* for which $f(T_{33}^*) = 0$. With this value , we obtain from the three first equations

$$G_{32} = \frac{(a_{32})^{(6)}G_{33}}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]} , \quad G_{34} = \frac{(a_{34})^{(6)}G_{33}}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

- (g) By the same argument, the equations 92,93 admit solutions G_{13}, G_{14} if 569

$$\varphi(G) = (b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} - [(b'_{13})^{(1)}(b''_{14})^{(1)}(G) + (b'_{14})^{(1)}(b''_{13})^{(1)}(G)] + (b''_{13})^{(1)}(G)(b''_{14})^{(1)}(G) = 0$$
 Where in $G(G_{13}, G_{14}, G_{15}), G_{13}, G_{15}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{14} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi(G^*) = 0$
- (h) By the same argument, the equations 92,93 admit solutions G_{16}, G_{17} if 570

$$\varphi(G_{19}) = (b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} - [(b'_{16})^{(2)}(b''_{17})^{(2)}(G_{19}) + (b'_{17})^{(2)}(b''_{16})^{(2)}(G_{19})] + (b''_{16})^{(2)}(G_{19})(b''_{17})^{(2)}(G_{19}) = 0$$
 Where in $(G_{19})(G_{16}, G_{17}, G_{18}), G_{16}, G_{18}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{17} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi((G_{19})^*) = 0$ 571
- (i) By the same argument, the concatenated equations admit solutions G_{20}, G_{21} if 572

$$\varphi(G_{23}) = (b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} - [(b'_{20})^{(3)}(b''_{21})^{(3)}(G_{23}) + (b'_{21})^{(3)}(b''_{20})^{(3)}(G_{23})] + (b''_{20})^{(3)}(G_{23})(b''_{21})^{(3)}(G_{23}) = 0$$
 Where in $G_{23}(G_{20}, G_{21}, G_{22}), G_{20}, G_{22}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{21} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{21}^* such that $\varphi((G_{23})^*) = 0$ 573
- (j) By the same argument, the equations of modules admit solutions G_{24}, G_{25} if 574

$$\varphi(G_{27}) = (b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - [(b'_{24})^{(4)}(b''_{25})^{(4)}(G_{27}) + (b'_{25})^{(4)}(b''_{24})^{(4)}(G_{27})] + (b''_{24})^{(4)}(G_{27})(b''_{25})^{(4)}(G_{27}) = 0$$
 Where in $(G_{27})(G_{24}, G_{25}, G_{26}), G_{24}, G_{26}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{25} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{25}^* such that $\varphi((G_{27})^*) = 0$
- (k) By the same argument, the equations (modules) admit solutions G_{28}, G_{29} if 575

$$\varphi(G_{31}) = (b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - [(b'_{28})^{(5)}(b''_{29})^{(5)}(G_{31}) + (b'_{29})^{(5)}(b''_{28})^{(5)}(G_{31})] + (b''_{28})^{(5)}(G_{31})(b''_{29})^{(5)}(G_{31}) = 0$$
 Where in $(G_{31})(G_{28}, G_{29}, G_{30}), G_{28}, G_{30}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{29} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{29}^* such that $\varphi((G_{31})^*) = 0$
- (l) By the same argument, the equations (modules) admit solutions G_{32}, G_{33} if 578

$$\varphi(G_{35}) = (b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - [(b'_{32})^{(6)}(b''_{33})^{(6)}(G_{35}) + (b'_{33})^{(6)}(b''_{32})^{(6)}(G_{35})] + (b''_{32})^{(6)}(G_{35})(b''_{33})^{(6)}(G_{35}) = 0$$
579
580
581
 Where in $(G_{35})(G_{32}, G_{33}, G_{34}), G_{32}, G_{34}$ must be replaced by their values It is easy to see that φ is a decreasing function in G_{33} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{33}^* such that $\varphi(G^*) = 0$
- Finally we obtain the unique solution of 89 to 94 582
 G_{14}^* given by $\varphi(G^*) = 0, T_{14}^*$ given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)}G_{14}^*}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]}, \quad G_{15}^* = \frac{(a_{15})^{(1)}G_{14}^*}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

$$T_{13}^* = \frac{(b_{13})^{(1)}T_{14}^*}{[(b'_{13})^{(1)} - (b''_{13})^{(1)}(G^*)]}, \quad T_{15}^* = \frac{(b_{15})^{(1)}T_{14}^*}{[(b'_{15})^{(1)} - (b''_{15})^{(1)}(G^*)]}$$
 Obviously, these values represent an equilibrium solution
- Finally we obtain the unique solution 583
 G_{17}^* given by $\varphi((G_{19})^*) = 0, T_{17}^*$ given by $f(T_{17}^*) = 0$ and 584

$$G_{16}^* = \frac{(a_{16})^{(2)}G_{17}^*}{[(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17}^*)]}, \quad G_{18}^* = \frac{(a_{18})^{(2)}G_{17}^*}{[(a'_{18})^{(2)} + (a''_{18})^{(2)}(T_{17}^*)]}$$
585

$$T_{16}^* = \frac{(b_{16})^{(2)}T_{17}^*}{[(b'_{16})^{(2)} - (b''_{16})^{(2)}((G_{19})^*)]}, \quad T_{18}^* = \frac{(b_{18})^{(2)}T_{17}^*}{[(b'_{18})^{(2)} - (b''_{18})^{(2)}((G_{19})^*)]}$$
586
 Obviously, these values represent an equilibrium solution 587
 Finally we obtain the unique solution 588
 G_{21}^* given by $\varphi((G_{23})^*) = 0, T_{21}^*$ given by $f(T_{21}^*) = 0$ and

$$G_{20}^* = \frac{(a_{20})^{(3)}G_{21}^*}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]}, \quad G_{22}^* = \frac{(a_{22})^{(3)}G_{21}^*}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]}$$

$$T_{20}^* = \frac{(b_{20})^{(3)}T_{21}^*}{[(b'_{20})^{(3)} - (b''_{20})^{(3)}(G_{23}^*)]}, \quad T_{22}^* = \frac{(b_{22})^{(3)}T_{21}^*}{[(b'_{22})^{(3)} - (b''_{22})^{(3)}(G_{23}^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{25}^* given by $\varphi(G_{27}) = 0$, T_{25}^* given by $f(T_{25}^*) = 0$ and

$$G_{24}^* = \frac{(a_{24})^{(4)} G_{25}^*}{[(a'_{24})^{(4)} + (a''_{24})^{(4)} (T_{25}^*)]} , G_{26}^* = \frac{(a_{26})^{(4)} G_{25}^*}{[(a'_{26})^{(4)} + (a''_{26})^{(4)} (T_{25}^*)]}$$

$$T_{24}^* = \frac{(b_{24})^{(4)} T_{25}^*}{[(b'_{24})^{(4)} - (b''_{24})^{(4)} ((G_{27})^*)]} , T_{26}^* = \frac{(b_{26})^{(4)} T_{25}^*}{[(b'_{26})^{(4)} - (b''_{26})^{(4)} ((G_{27})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{29}^* given by $\varphi((G_{31})^*) = 0$, T_{29}^* given by $f(T_{29}^*) = 0$ and

$$G_{28}^* = \frac{(a_{28})^{(5)} G_{29}^*}{[(a'_{28})^{(5)} + (a''_{28})^{(5)} (T_{29}^*)]} , G_{30}^* = \frac{(a_{30})^{(5)} G_{29}^*}{[(a'_{30})^{(5)} + (a''_{30})^{(5)} (T_{29}^*)]}$$

$$T_{28}^* = \frac{(b_{28})^{(5)} T_{29}^*}{[(b'_{28})^{(5)} - (b''_{28})^{(5)} ((G_{31})^*)]} , T_{30}^* = \frac{(b_{30})^{(5)} T_{29}^*}{[(b'_{30})^{(5)} - (b''_{30})^{(5)} ((G_{31})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{33}^* given by $\varphi((G_{35})^*) = 0$, T_{33}^* given by $f(T_{33}^*) = 0$ and

$$G_{32}^* = \frac{(a_{32})^{(6)} G_{33}^*}{[(a'_{32})^{(6)} + (a''_{32})^{(6)} (T_{33}^*)]} , G_{34}^* = \frac{(a_{34})^{(6)} G_{33}^*}{[(a'_{34})^{(6)} + (a''_{34})^{(6)} (T_{33}^*)]}$$

$$T_{32}^* = \frac{(b_{32})^{(6)} T_{33}^*}{[(b'_{32})^{(6)} - (b''_{32})^{(6)} ((G_{35})^*)]} , T_{34}^* = \frac{(b_{34})^{(6)} T_{33}^*}{[(b'_{34})^{(6)} - (b''_{34})^{(6)} ((G_{35})^*)]}$$

Obviously, these values represent an equilibrium solution

ASYMPTOTIC STABILITY ANALYSIS

Theorem 4: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ belong to $C^{(1)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + \mathbb{G}_i , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial (a_i'')^{(1)}}{\partial T_{14}} (T_{14}^*) = (q_{14})^{(1)} , \frac{\partial (b_i'')^{(1)}}{\partial G_j} (G^*) = s_{ij}$$

Then taking into account equations (global) and neglecting the terms of power 2, we obtain

$$\frac{dG_{13}}{dt} = -((a'_{13})^{(1)} + (p_{13})^{(1)})G_{13} + (a_{13})^{(1)}G_{14} - (q_{13})^{(1)}G_{13}^*T_{14}$$

$$\frac{dG_{14}}{dt} = -((a'_{14})^{(1)} + (p_{14})^{(1)})G_{14} + (a_{14})^{(1)}G_{13} - (q_{14})^{(1)}G_{14}^*T_{14}$$

$$\frac{dG_{15}}{dt} = -((a'_{15})^{(1)} + (p_{15})^{(1)})G_{15} + (a_{15})^{(1)}G_{14} - (q_{15})^{(1)}G_{15}^*T_{14}$$

$$\frac{dT_{13}}{dt} = -((b'_{13})^{(1)} - (r_{13})^{(1)})T_{13} + (b_{13})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(13)(j)})T_{13}^*G_j$$

$$\frac{dT_{14}}{dt} = -((b'_{14})^{(1)} - (r_{14})^{(1)})T_{14} + (b_{14})^{(1)}T_{13} + \sum_{j=13}^{15} (s_{(14)(j)})T_{14}^*G_j$$

$$\frac{dT_{15}}{dt} = -((b'_{15})^{(1)} - (r_{15})^{(1)})T_{15} + (b_{15})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(15)(j)})T_{15}^*G_j$$

If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ belong to $C^{(2)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable

Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + \mathbb{G}_i , T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial (a_i'')^{(2)}}{\partial T_{17}} (T_{17}^*) = (q_{17})^{(2)} , \frac{\partial (b_i'')^{(2)}}{\partial G_j} ((G_{19})^*) = s_{ij}$$

taking into account equations (global) and neglecting the terms of power 2, we obtain

$$\frac{dG_{16}}{dt} = -((a'_{16})^{(2)} + (p_{16})^{(2)})G_{16} + (a_{16})^{(2)}G_{17} - (q_{16})^{(2)}G_{16}^*T_{17}$$

$$\frac{dG_{17}}{dt} = -((a'_{17})^{(2)} + (p_{17})^{(2)})G_{17} + (a_{17})^{(2)}G_{16} - (q_{17})^{(2)}G_{17}^*T_{17}$$

- [26]. [^] There is usually more than one possible way to define a field energy, because any field can be made to couple to gravity in many different ways. By general scaling arguments, the correct answer at everyday distances, which are long compared to the quantum gravity scale, should be *minimal coupling*, which means that no powers of the curvature tensor appear. Any non-minimal couplings, along with other higher order terms, are presumably only determined by a theory of quantum gravity, and within string theory, they only start to contribute to experiments at the string scale.

The introduction is a collection of information from various articles, Books, News Paper reports, Home Pages Of authors, Journal Reviews, Nature 's Letters, Article Abstracts, Research papers, Abstracts Of Research Papers, Stanford Encyclopedia, Web Pages, Ask a Physicist Column, Deliberations with Professors, the internet including Wikipedia. We acknowledge all authors who have contributed to the same. In the eventuality of the fact that there has been any act of omission on the part of the authors, we regret with great deal of compunction, contrition, regret, trepidation and remorse. As Newton said, it is only because erudite and eminent people allowed one to piggy ride on their backs; probably an attempt has been made to look slightly further. Once again, it is stated that the references are only illustrative and not comprehensive

First Author: ¹**Mr. K. N.Prasanna Kumar** has three doctorates one each in Mathematics, Economics, Political Science. Thesis was based on Mathematical Modeling. He was recently awarded D.litt. for his work on 'Mathematical Models in Political Science'--- Department of studies in Mathematics, Kuvempu University, Shimoga, Karnataka, India Corresponding

Second Author: ²**Prof. B.S Kiranagi** is the Former Chairman of the Department of Studies in Mathematics, Manasa Gangotri and present Professor Emeritus of UGC in the Department. Professor Kiranagi has guided over 25 students and he has received many encomiums and laurels for his contribution to Co homology Groups and Mathematical Sciences. Known for his prolific writing, and one of the senior most Professors of the country, he has over 150 publications to his credit. A prolific writer and a prodigious thinker, he has to his credit several books on Lie Groups, Co Homology Groups, and other mathematical application topics, and excellent publication history.-- UGC Emeritus Professor (Department of studies in Mathematics), Manasagangotri, University of Mysore, Karnataka, India

Third Author: ³**Prof. C.S. Bagewadi** is the present Chairman of Department of Mathematics and Department of Studies in Computer Science and has guided over 25 students. He has published articles in both national and international journals. Professor Bagewadi specializes in Differential Geometry and its wide-ranging ramifications. He has to his credit more than 159 research papers. Several Books on Differential Geometry, Differential Equations are coauthored by him--- Chairman, Department of studies in Mathematics and Computer science, Jnanasahyadri Kuvempu University, Shankarghatta, Shimoga district, Karnataka, India

A New Three Phase Seven Level Asymmetrical Inverter with Hybrid Carrier and Third Harmonic Reference

ABSTRACT: Carrier based techniques have been used widely for switching of multilevel inverters due to their simplicity, flexibility and reduced computational requirements compared to Space Vector Modulation (SVM). A novel carrier based Pulse Width Modulation (PWM) technique for three phase Asymmetrical Multi Level Inverter (AMLI) with Third Harmonic Injection (THI) reference is proposed in this paper. The technique is based on the combination of the Control Freedom Degrees (CFD). The combination of inverted sine carrier and triangular carrier is used as hybrid carrier in order to produce pulses for the power switches used in the proposed seven level three phase cascaded inverter. This paper investigates the potentials of hybrid carrier based cascaded multilevel inverter in the development of medium power AC power supplies with specific emphasis on Power Conditioning Systems (PCS) for alternate sources of energy. The performance of chosen inverter is evaluated based on MATLAB/ SIMULINK simulation. The performance indices used are Total Harmonic Distortion (THD), RMS value of output voltage and DC bus utilization. It is observed that Carrir over lapping PWM provides better DC bus utilization and Phase opposition Disposition (POD) technique creates less distortion for $m_a=0.7-1$

Keywords: APOD, COPWM, PD, POD, ISPWM

I. INTRODUCTION

In recent years, multi-level Voltage Source Inverters (VSIs) are widely used as static power converter for high-power applications. MLIs can operate at both fundamental switching frequency and high switching frequency PWM. The topologies of MLIs are classified into three types: the flying capacitor inverter, the diode clamped inverter and the modular H-bridge inverter. Seyezhai and Mathur [1] have described a technique that combines the advantage of inverted rectified sine wave and variable frequency carriers for a seven level inverter for balancing the switch utilization and have also stated that the switching losses for the chosen modulation scheme is very less. Chandra and Kumar in [2] presented an automatic switching pattern generation for multilevel cascaded H-Bridge inverters with equal DC voltage sources based on the Space Vector Pulse Width Modulation (SVPWM) technique. Seyezhai and Mathur [3,4] have done a comparative evaluation between hybrid modulation strategy and the conventional Phase Disposition (PD) PWM method in terms of output voltage quality, power circuitry complexity, Distortion Factor (DF) and THD. Jeevananthan et al [5] have proposed an Inverted Sine Carrier PWM (ISCPWM) method which used the

conventional sinusoidal reference signal and an inverted sine carrier to produce better spectral quality and a higher fundamental component compared to the conventional Sinusoidal PWM (SPWM) without any pulse dropping. A survey of topologies, controls and applications of MLIs has been carried out by Rodriguez et al [6]. The common topology is the cascaded inverter shown in Fig.1 for three phase structure. The three multilevel modulation methods most discussed in the literature include multilevel carrier-based PWM, multilevel space-vector PWM and selective harmonic elimination [6]. Analysis of multicarrier PWM methods for a single phase five level inverter was proposed by Calais Borle and Agelidis [7]. A novel clew for the research on carrier based PWM methods for multilevel inverters is proposed by Wu et al [8] based on the concept of combination of the Control Freedom Degrees (CFD). Sun [9] have presented a new asymmetrical multilevel inverter topology. The new topology can improve the number of output voltage levels greatly using a bidirectional auxiliary switch. Further they have proposed multicarrier PWM method for the asymmetrical inverter [9]. Taleb et al [10] have proposed a neural implementation of a Harmonic Elimination Strategy (HES) to control a Uniform Step Asymmetrical Multilevel Inverter (USAMI). Mihalache [11] has proposed an asymmetrical PWM modulation technique which is known to offer lower harmonic content as compared to the symmetrical modulation. Nami et al [12] have optimized asymmetrical arrangement compared with a conventional four level inverter and found that it exhibits lesser switching losses and lesser harmonics. In some application with different DC input sources such as electric vehicles, a modular H-bridge asymmetrical inverter can be used to drive a traction motor from a set of solar cells or fuel cells. A seven level output voltage is achieved with two bridges in asymmetrical inverter whereas only five level output voltage will be achieved with three bridges in case of conventional cascaded MLI. In AMLI with lesser number switches more voltage levels can be achieved. Fig.1. shows the chosen asymmetrical three phase inverter. Each cell has two pairs of complementary switches S1 and S3 and S2 and S4. There are six cells used in the three phase inverter each leg containing two cells each. Since the carrier based method have good CFD, this paper focusses on the hybrid carrier arrangement using triangular carrier in the positive side and inverted sine carrier waveform in the negative side with Phase Disposition (PD), Phase Opposition Disposition (POD), Alternate Phase Opposition Disposition (APOD), Carrier Overlapping (CO) and Inverted Sine (IS) strategies. Fig.2. shows a sample SIMULINK model developed for PWM strategy of a three phase inverter.

II. HYBRID CARRIER BASED BIPOLAR MODULATION SCHEMES WITH THI REFERENCE

The maximum modulation index of a three phase inverter can be increased by including a common mode third harmonic term into the target reference waveform of each phase leg. In this method, the modulation index m_a can be increased beyond $m_a=1.0$ without moving into over modulation.

II (a) PDPWM hybrid carrier strategy

This technique employs $(m-1)$ carriers which are all in phase for a m level inverter. In seven level converter all the six carrier waves are in phase with each other across all the bands as described in Fig.3 for a phase leg of a seven level cascaded structure with $m_a = 0.8$.

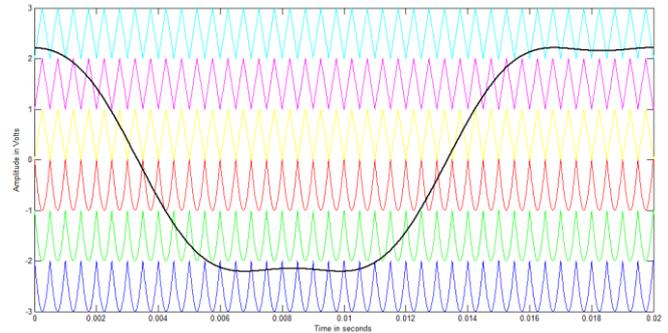

Fig.3. Carrier arrangements for PDPWM hybrid carrier strategy

II (b) PODPWM hybrid carrier

This technique employs $(m-1)$ carriers which are all in phase above and below the zero reference. In seven level converters all the six carrier waves above zero reference are phase shifted by 180 degrees with the ones below zero reference. The PODPWM is explained in the Fig.4 in which all the carriers above the zero reference are in phase and carriers below the zero reference are also in phase but are phase shifted by 180 degree with respect to that above zero reference. Fig.4 illustrates the POD PWM hybrid carrier and THI reference arrangements for a phase leg of a three phase seven level cascaded structure with $m_a = 0.8$.

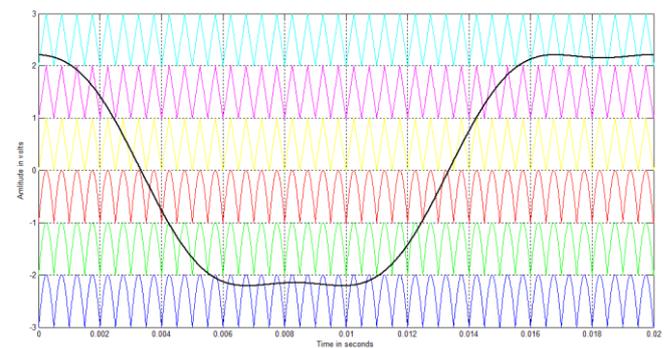

Fig.4. Carrier arrangements for PODPWM hybrid carrier strategy

II (c) APODPWM hybrid carrier strategy

This technique requires each of the $m-1$ carrier waveforms for an m -level phase waveform to be phase displaced from each other by 180 degrees alternatively. In The APOD hybrid carrier and THI reference arrangements for a phase leg of a three phase seven level cascaded structure with $m_a=0.8$ are illustrated in Fig.5.

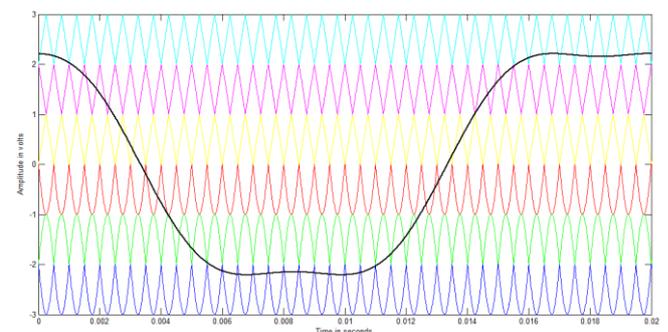

Fig.5. Carrier arrangements for APODPWM hybrid carrier strategy

II (d) COPWM hybrid carrier

For an m-level inverter using carrier overlapping technique, (m-1) carriers with the same frequency (f_c) and same peak-to-peak amplitude (A_c) are disposed such that the bands they occupy overlap each other; the overlapping vertical distance between each carrier is $0.5A_c$. The reference waveform has amplitude of A_m and frequency of f_m and it is centered in the middle of the carrier signals.

Fig.6 shows the COPWM hybrid carrier and THI reference arrangements for a phase leg of a three phase seven level cascaded structure with $m_a=0.8$.

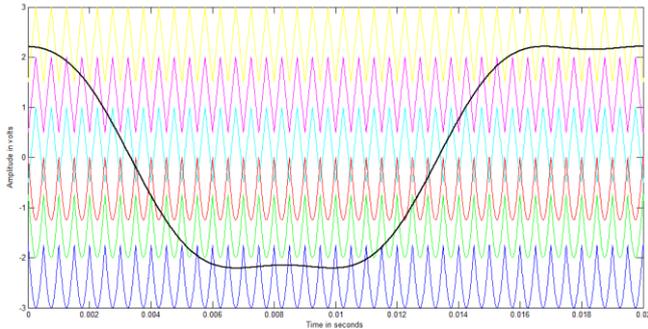

Fig.6. Carrier arrangements for COPWM hybrid carrier strategy

II (e) VFPWM hybrid carrier strategy

Fig.7 illustrates the VFPWM hybrid carrier and THI reference arrangements for a phase leg of a seven level three phase cascaded structure with $m_a = 0.8$.

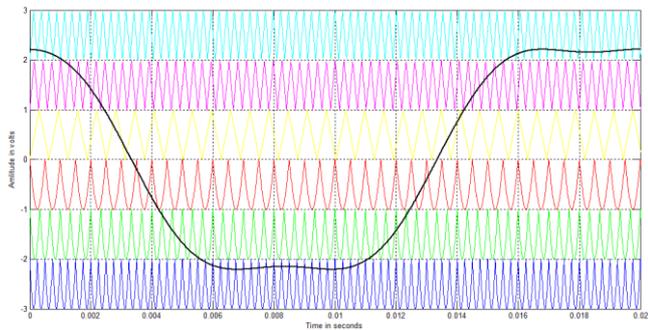

Fig.7. Carrier arrangements for VFPWM hybrid carrier strategy

The frequency modulation index

$$m_f = f_c / f_m$$

The amplitude modulation index

$$m_a = 2A_m / (m-1) A_c$$

where

f_c – Frequency of the carrier signal

f_m – Frequency of the reference signal

A_m – Amplitude of the reference signal

A_c – Amplitude of the carrier signal

$$m_a = A_m / (m / 4) * A_c \text{ (COPWM)}$$

III. SIMULATION RESULTS

Simulation results have been obtained by using MATLAB/SIMULINK power system toolbox software. The

input DC sources are asymmetrical i.e one of the cascaded bridge is fed with V_{dc2} and other by V_{dc} . Figs.8-12 illustrate the output voltages of three phase asymmetrical cascaded seven level multilevel inverter for $m_a=0.8$ only. The Root Mean Square (RMS) value, Total Harmonic Distortion (THD) and Form Factor (FF) of output voltage are evaluated with suitable formula and for various hybrid modulation schemes such as PD, POD, APOD, COPWM, VFPWM strategies for various m_a (0.7-1) as in Tables I-III. Fig.13-18 display the frequency spectra and %THD for chosen strategies. It is found that the DC bus utilisation of the three phase seven level cascaded multilevel inverter is much better in case of COPWM as in Table II. POD technique is formed to create less distortion. It is seen that 3rd,37th, 39th harmonics are dominant in PD and POD PWM where as 3rd,27th,31st,33rd,35th,37th,39th harmonics are dominant in APOD PWM. VFPWM creates only 3rd harmonic dominant energy where as in COPWM 3rd,35th,37th,39th harmonics are dominant. The following parameter values are used simulation: $V_{dc1} = 100V$, $V_{dc2} = 50V$, $A_c=1$, $m_f=40$ and $R(\text{load}) = 100$ ohms for each phase.

0.8	1064	1.6E+09	1.6E+09	682.1	870
0.75	1001.6	1.6E+09	1.6E+09	928.9	523.7
0.7	280.48	1.6E+09	1.6E+09	422.9	557.5

IV. CONCLUSION

A new hybrid modulation strategy is proposed for a three phase AMLI which achieves improvement in line to line voltage harmonics compared to the conventional modulation techniques. It is observed that COPWM provides better DC bus utilization and POD technique creates less distortion for $m_a=0.7-1$.

Performance of Symmetrical and Asymmetrical Multilevel Inverters

K. Lakshmi Ganesh , U. Chandra Rao

^{1,2}(Department of Electrical and Electronics Engineering, Sri Vasavi Engineering College, India

Abstract: Distributed Energy Resources (DER) are systems that produce electrical power at the site where the power is needed. If only electrical power is used then the technology is called Distributed Generation (DG). The objective of this paper is to study a novel more than five level multistring inverter topology for DERs based DC/AC conversion system. The distributed energy resource based single-phase inverter is usually adopted in the microgrid system. In order to reduce the conversion losses, the key is to saving costs and size by removing any kind of transformer as well as reducing the power switches. In this study, a high step-up converter is introduced as a front-end stage to improve the conversion efficiency of conventional boost converters and to stabilize the output DC voltage of various DERs such as photovoltaic for use with the simplified multilevel inverter. In addition, two active switches are operated under line frequency. In this project a novel asymmetrical configuration is proposed. The proposed asymmetrical configuration uses less number of switches to get more levels. It will reduce the cost, reduce the number of sources, complexity, losses and improves reliability. The proposed converter is simulated by Matlab/Simulink software and simulation results are presented.

Key words: DC/AC power conversion, multilevel inverter, harmonic analysis and Total Harmonic Distortion (THD).

I. INTRODUCTION

The continuous economic development of many countries and the environmental issues (gas emissions and the green house effect) observed in the last decades forced an intense research in renewable energy sources. Distributed energy resources are small, modular, energy generation and storage technologies that provide electric capacity or energy where you need it. Typically producing less than 10 megawatts (MW) of power, DER systems can usually be sized to meet your particular needs and installed on site.

DER technologies include wind turbines, photo voltaic (PV), fuel cells, micro turbines, reciprocating engines, Hydro, combustion turbines and energy storage systems are the most explored technologies due to their considerable advantages [1],[2], such as reliability, reasonable installation and energy production costs, low environmental impact, capability to support micro grid [3].

The renewable energy resources consists of photovoltaic, fuel cells are generate the voltage are dc voltage. But I want the ac voltage because of mostly used the loads are ac loads. So we are convert the dc power to ac

powerprocessing interface is required and is Commercial, homes, factories and utility grid standards [4],[7].

Differing converter topographies have been acquired DERs establish effectual power flow control performance of DERs. DER systems may be either connected to the local electric power grid or isolated from the grid in stand-alone applications [7], [10].

The dc-dc converters are two types. They are without galvanic isolation and with galvanic isolation (high frequency transformer).The with galvanic isolation converter (high power applications) are used corresponding to size, weight, expense reduces. So low and medium power applications without galvanic isolation means make no use of transformers corresponding to reduces the size, weight expense [7], [8].

The next procedure the output voltage level increases of the inverter output then automatically harmonic component of the output voltage of inverter reduces and also corresponding to small size of filters are used simultaneously the cost reduces. The differing multilevel topographies are usually characterizing by strong reduction of switching power losses and electromagnetic interference (EMI) [6], [7], [8].

A new simplified single-phase multistring five-level multilevel inverter topography of dc/ac power conversion with auxiliary circuit proposed [8], [9]. This topography are used, the number of switching devices and output harmonics are reduced. The THD of the multistring five-level inverter is much less than the conventional multistring three-level inverter because of additional auxiliary circuit has high switching losses [9].

The objective of this paper is to study a newly constructed transformerless five level multistring inverter topology for DERS. In this letter aforesaid GZV-based inverter is reduced to a multistring multilevel inverter topography that require only 6 active switches instead of existing cascaded H-bridge multilevel inverter have eight switches[10].Multi string multilevel inverter have six active switches. They are middle two switches are operated fundamental frequency and remaining four switches are operated switching frequency. A high efficiency dc-dc boost converter reduction of transformer and device voltage and current stresses with continuous input current leakage inductance energy recovery, and avoiding the use of electrolytic capacitor due to reduced ripple current[13]. Operation of the system configuration of operation is shown below. The performance of symmetrical and asymmetrical single phase multilevel inverter with respect to harmonics content and number of switches and input voltage source is DC is simulated by MATLAB/Simulink. A detailed harmonic

analysis is done on the multilevel inverter by considering up to 23rd harmonics for 7 levels to 13 levels operation.

II. SYSTEM CONFIGURATION OF OPERATION PRINCIPLES

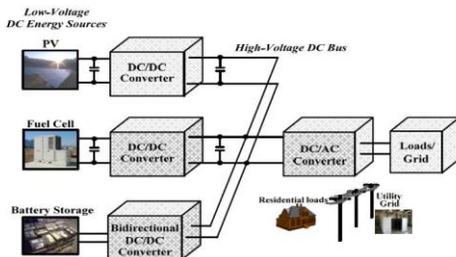

Fig.1 Different type of DERs are system configuration of Multistring Inverter

The above Fig.1 shows the DERs have photovoltaics or Fuel cell inverter are taken as [14]. The individual dc/dc boost converter are connected to the photovoltaic modules or Fuel cell. The bidirectional (buck-boost) dc/dc converter is connected to the only for battery storage. The individual dc/dc boost converter is connected to the multistring inverter. These common inverter for interface with all dc/dc converters of DERs [15]. The two modes of operation above Fig.1. They are standalone mode and grid connected mode. In grid connected mode, the battery storage energy is not connected to the grid. In standalone operation, the battery storage energy is connected to the load.

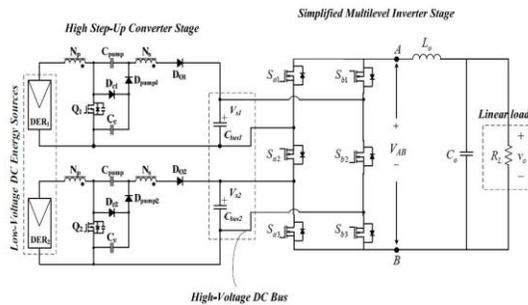

Fig.2 Single phase simplified multistring five-level inverter topology for high stepup converter from DERs

The above Fig.2 shows DER module-1 is connected to the high step up dc/dc converter and DER module-2 is connected to high step up dc/dc converter. These two converters are connected to their individual dc-bus capacitor and a simplified multilevel inverter. The resistive load is connected output of the simplified multilevel inverter from DER through high step up dc/dc converter. The input sources of DERs are photovoltaic or Fuel cells. The basic circuit have eight switches of cascaded H-bridge Multilevel inverter (CHB) with phase shift carrier pulse width modulation scheme are used. The simplified multilevel inverter have six switches then best merits of improved output waveforms, reduced the filter size, low EMI and THD [11],[12]. It should be noted that, by using independent voltage regulation control of the individual high step-up converter, voltage balance control for the two bus capacitors C_{bus1} , C_{bus2} can be achieved normally.

2.1. High Step-Up Converter Stage

In this study, High Efficiency Converter with Charge Pump and Coupled Inductor for Wide Input Photovoltaic AC Module Applications [13]. This simplified multilevel inverter combines the behavior of three different converter topologies: boost, flyback and charge pump. The flyback aspect of the topology allows the design to be optimized in terms of the transformer turns-ratio, allowing for much higher voltage gains than would be possible with a boost converter. However, flyback converters are notoriously inefficient and are very sensitive to leakage inductance, which can cause undue voltage-stress on switches and diodes. By using a clamp-circuit- identical to the output of a boost-converter-after the main switch, much of the efficiency issues can be resolved and the transformer design becomes less complicated. Finally, adding a charge-pump capacitor across the primary and secondary windings of the transformers gives higher converter voltage-gain and reduced peak current stress by allowing the current of the primary-windings to continuous.

The equivalent circuit of the proposed converter is shown in Fig.3. The coupled inductor is modeled as a magnetizing inductor L_m an ideal transformer with a turn's ratio of $N_s : N_p$ primary leakage inductor L_{Lk1} and secondary leakage inductor L_{Lk2} . C_c is the clamp capacitor, S is the Active switch, D_0 is the output diode C_{pump} is the charge pump capacitor. According to voltage-seconds balance condition of the magnetizing inductor, the voltage of the primary winding can be derived as

$$V_{pri} = V_{in} \frac{D}{1-D} \tag{1}$$

Where V_{in} represents each the low-voltage dc energy input sources and voltage of the secondary winding is

$$V_{sec} = \frac{N_s}{N_p} \cdot V_{pri} = \frac{N_s}{N_p} \cdot V_{in} \frac{D}{1-D} \tag{2}$$

Similar to that of the boost converter, the voltage of the charge-pump capacitor C_{pump} and clamp capacitor C_c can be expressed as

$$V_{C_{pump}} = V_{C_c} = V_{in} \cdot \frac{1}{1-D} \tag{3}$$

Hence, the voltage conversion ratio of the high step-up converter, named input voltage to bus voltage ratio, can be derived as [13].

$$\frac{V_0}{V_{in}} = \frac{\left(2 + \frac{N_s}{N_p} \cdot D\right)}{1-D} \tag{4}$$

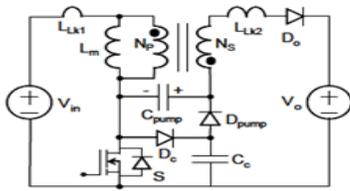

Fig.3. Equivalent circuit of the high step-up boost converter

2.2 Simplified Multilevel Inverter Stage

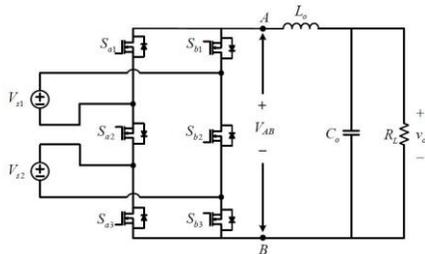

Fig.4 Basic Five-level inverter Circuitry of six switches

The simplified multilevel inverter is the conventional circuit of five level inverter Fig.4 shows above. A new single phase multistring topography, as a new basic circuitry in Fig.4. Referring to Fig.2, it is should be assumed that, in this configuration, the two capacitors in the capacitive voltage divider are connected directly across the dc bus and all switching combinations are activated in an output cycle. The dynamic voltage balance between the two capacitors is automatically controlled by the preceding high step-up converter stage. Then, we can assume $V_{s1} = V_{s2} = V_s$.

This circuit has six power switches compare the basic circuit of cascaded H-bridge has eight power switches which drastically reduces the power circuit complexity and simplifies modulation circuit design and implementation. The phase disposition (PD) pulse width modulation (PWM) control scheme is introduced to generate switching signals and to produce five output voltage levels: $0, V_s, 2V_s, -V_s$ and $2V_s$.

This inverter topology uses two carrier signals and one reference signal to generate the PWM signals for the switches the modulation strategy and its implemented logic scheme in Fig.5 (a) and (b) area widely used alternative for Phase disposition modulation. With the exception of an offset value equivalent to the carrier signal amplitude. Two comparators are used in this scheme with identical carrier signals V_{tri1} and V_{tri2} to provide high-frequency switching signals for S_{a1}, S_{b1}, S_{a3} and S_{b3} . Another comparator is used for zero-crossing detection to provide line-frequency switching signals for switches S_{a2} and S_{b2} .

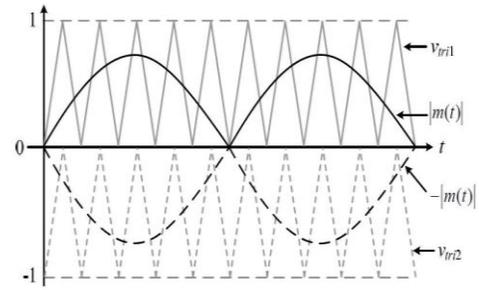

For Fig.4 the switching function of the switch defined as follows.

$$S_{aj} = 1, S_{aj} \text{ ON}$$

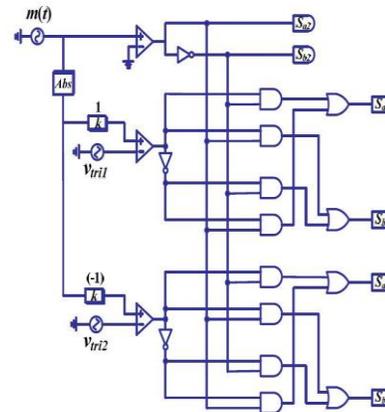

$$S_{aj} = 0, S_{aj} \text{ OFF for } j=1, 2, 3$$

$$S_{bj} = 1, S_{bj} \text{ ON}$$

$$S_{bj} = 0, S_{bj} \text{ OFF for } j=1, 2, 3$$

Table-I

Simplified Five Level Inverter Switching Combination

S_{a1}	S_{a2}	S_{a3}	S_{b1}	S_{b2}	S_{b3}	V_{AB}
0	1	0	1	0	1	$2V_s$
0	1	1	1	0	0	V_s
1	1	0	0	0	1	V_s
1	1	1	0	0	0	0
0	0	0	1	1	1	0
1	0	0	0	1	1	$-V_s$
0	0	1	1	1	0	$-V_s$
1	0	1	0	1	0	$-2V_s$

Table-I lists switching combinations that generate the required five output levels. The corresponding operation modes of the simplified multilevel inverter stage are described clearly as follows.

- 1) Maximum positive output voltage ($2V_s$): Active switches S_{a2}, S_{b3} and S_{b1} are ON. The voltage applied to the LC output filter is $2V_s$.
- 2) Half level positive output voltage ($+V_s$): The two switching combinations are there. One switching combination

is that active switches S_{a2} , S_{a3} and S_{b1} are ON, the other is active switches S_{a2} , S_{a1} and S_{b3} are ON. During this operating stage, the voltage applied to the LC output filter $+V_S$.

3) Zero Output, (0): This output condition either one of the leg are left or right all switches are ON. The load is short-circuited, and the voltage applied to the load terminals zero.

4) Half level negative output voltage ($-V_S$): the two switching combinations are there. One switching combination is such that active switches S_{a1} , S_{b2} and S_{b3} are ON, the other switching is active switches S_{b2} , S_{b1} and S_{a3} .

5) Maximum negative output ($-2V_S$): During this stage, active switches S_{a1} , S_{a3} and S_{b2} are ON, and the output voltage applied to the LC output filter $-2V_S$.

In these circuit operations, it can be observed that the open voltage stress of the active power switches S_{a1} , S_{b1} , S_{a3} and S_{b3} is equal to input voltage V_S and the main active switches S_{a2} and S_{b2} are operated at the line frequency. Hence, the switching losses are reduced in the new topology and the overall conversion efficiency is improved.

In Fig.5 control circuit diagram as shown, $m(t)$ is the sinusoidal modulation signal. Both V_{tri1} and V_{tri2} are two carrier signals. The magnitude value and frequency of the sinusoidal modulation signal are given as $m_{peak}=0.7$ and $f_m=60\text{Hz}$. The peak to peak value of the triangular modulation signals is equal to 1 and the switching frequency f_{tri1} and f_{tri2} are both given as 18.06 kHz.

The two input voltage sources feeding from the high step up converter is controlled at 100V that is $V_{s1} = V_{s2} = 100\text{V}$. The five level output of the phase voltage of the simulation waveform is shown in Fig.6.

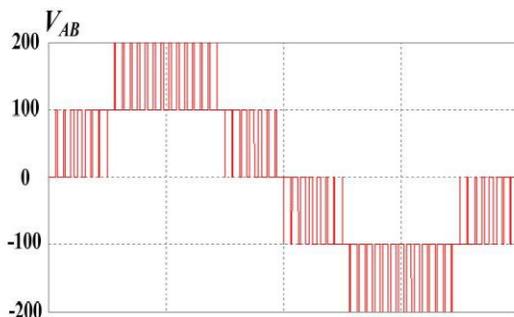

Fig.6 Simplified multilevel five level output phase voltage of simulation waveform V_{AB}

2.3 Basic circuit of Cascaded H-Bridge (CHB) Inverter

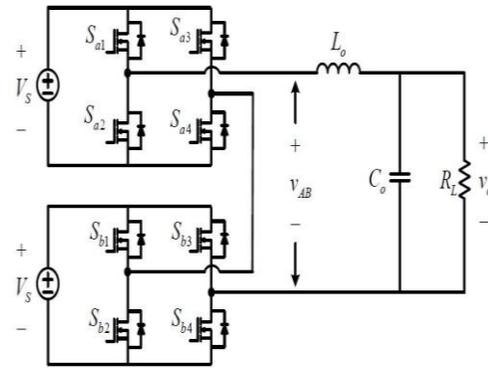

Fig.7 Basic circuit of five-level inverter topology of CHB inverter have eight switches

The above figure shows the Basic circuit of five level inverter CCHB inverter have eight switches. The carrier based sinusoidal phase shift carrier pulse width modulations are used in the basic circuit of CHB inverter. The eight switches are operated of the switching frequency. The CHB inverter are operate at the switching frequency is same as 18.06kHz the same modulation index $m_a=0.7$.

The simplified multilevel inverter and Cascaded H-bridge inverter are operated the same switching frequency and same modulation index m_a , the same input voltage $V_S=100\text{V}$ and output L-C filter, $L_o=20\text{mH}$, $C_o=200\mu\text{F}$, R-load $=10\Omega$. Table VII and Table VIII shows the harmonic component and THD Cascaded H-Bridge Inverter and Simplified multilevel inverter. The simplified multilevel inverter have the lesser THD compare to the Cascaded H-bridge inverter. So the low values of LC filter.

The symmetrical multilevel inverters are Cascaded H-bridge inverter and Simplified multilevel inverter. These are taken the equal voltage values. The symmetrical multilevel inverters above are operated with PWM method. The Proposing methods of asymmetrical multilevel inverters are repeating sequence is used for Seven, Nine, Eleven and Thirteen levels. The seven level have 6switches and Nine, Eleven and Thirteen level have 8 switches. The Seven, Nine, Eleven and Thirteen levels are get by using 12,16,20,24 switches are necessity in symmetrical configuration of Cascaded H-bridge inverter. So the less number of switches are in asymmetrical configuration to get more number of voltage levels, lesser the THD, low cost, reducing the DC sources, reduce the complexity and driving circuits.

III. PROPOSED SYTEM

3.1Seven Level Multi Level Inverter (MLI)

Table- II
Seven Level Multilevel Inverter (MLI)

S_{a1}	S_{a2}	S_{a3}	S_{b1}	S_{b2}	S_{b3}	V_0
0	1	0	1	0	1	$3V_s$
1	1	0	0	0	1	$2V_s$
0	1	1	1	0	0	V_s
1	1	1	0	0	0	0
0	0	0	1	1	1	0
1	0	0	0	1	1	$-V_s$
0	0	1	1	1	0	$-2V_s$
1	0	1	0	1	0	$-3V_s$

The above Table II is shows the active switches operation of seven level, 1 means the switch is ON, the 0 means the switch is OFF. Then we will get the seven level output voltage from the six switches only.

3.2Nine Level Multi Level Inverter (MLI)

Table- III
Nine level Multilevel (MLI)

0	1	1	1	1	0	0	0	V_s
1	1	1	1	0	0	0	0	0
0	0	0	0	1	1	1	1	0
1	0	0	0	0	1	1	1	$-V_s$
1	1	1	0	0	0	0	1	$-2V_s$
0	0	1	0	1	1	0	1	$-3V_s$
1	0	1	0	0	1	0	1	$-4V_s$

The above Table III is shows the active switches operation of eight switches with nine level, 1 means the switch is ON, the 0 means the switch is OFF. Then we will get the nine level output voltage from the eight switches only.

3.3Eleven Level Multilevel inverter (MLI)

Table- IV
Eleven level multilevel Inverter (MLI)

S_1	S_2	S_3	S_4	S_5	S_6	S_7	S_8	V_0
0	1	0	1	1	0	1	0	$5V_s$
1	1	0	1	0	0	1	0	$4V_s$
0	1	0	0	1	0	1	1	$3V_s$
1	1	0	0	0	0	1	1	$2V_s$
0	1	1	1	1	0	0	0	V_s
1	1	1	1	0	0	0	0	0
0	0	0	0	1	1	1	1	0
1	0	0	0	0	1	1	1	$-V_s$
0	0	1	1	1	1	0	0	$-2V_s$
1	0	1	1	0	1	0	0	$-3V_s$
0	0	1	0	1	1	0	1	$-4V_s$
1	0	1	0	0	1	0	1	$-5V_s$

The above Table VI is shows the active switches operation of eight switches with eleven level, 1 means the switch is ON, the 0 means the switch is OFF. Then we will get the eleven level output voltage from the eight switches only.

3.4 Thirteen Level multi Level inverter

Table-V
Thirteen level multi level inverter (MLI)

S_1	S_2	S_3	S_4	S_5	S_6	S_7	S_8	V_0
0	1	0	1	1	0	1	0	$6V_s$
0	1	0	0	1	0	1	1	$5V_s$
1	1	0	1	0	0	1	0	$4V_s$
1	1	0	0	0	0	1	1	$3V_s$
0	1	1	1	1	0	0	0	$2V_s$
0	0	0	1	1	1	1	0	V_s
1	1	1	1	0	0	0	0	0
0	0	0	0	1	1	1	1	0
1	1	1	0	0	0	0	1	$-V_s$
1	0	0	0	0	1	1	1	$-2V_s$
0	0	1	1	1	1	0	0	$-3V_s$
0	0	1	0	1	1	0	1	$-4V_s$
1	0	1	1	0	1	0	0	$-5V_s$
1	0	1	0	0	1	0	1	$-6V_s$

The above Table V is shows the active switches operation of eight switches with thirteen level, 1 means the switch is ON, the 0 means the switch is OFF. Then we will get the thirteen level output voltage from the eight switches only.

3.5 Different voltages are taken as the source voltages of the asymmetrical multilevel inverters

TABLE VI
 DIFFEERENT VOLTAGES

No of levels	No of Switches	V1	V2	V3	Output Voltage in V
7	6	V_S	$2V_S$	-	$3V_S$
9	8	V_S	V_S	$2V_S$	$4V_S$
11	8	V_S	$2V_S$	$2V_S$	$5V_S$
13	8	V_S	$2V_S$	$3V_S$	$6V_S$

The seven level output voltage are get only from six switches only. The nine level, eleven level and thirteen level output voltage are get only from eight switches corresponding to respective voltage sources are taken.

The above table VI shows different voltages are taken for asymmetrical multilevel inverters. The asymmetrical multilevel inverters are simulated the output voltage are designed by using 200V. The seven level output voltage are get by using $V1=66.66V$, $V2=133.33V$. The nine level output voltage are get by using $V1=50V$, $V2=50V$, $V3=100V$. The eleven level output voltage are get by using $V1=40V$, $V2=80V$, $V3=80V$. The thirteen level output voltage are get by using $V1=66.66V$, $V2=99.99V$, $V3=33.33V$. The asymmetrical multilevel inverters are simulate the above written voltage values.

IV. MATLAB/SIMULATION RESULTS

4.1 Basic circuit of Cascaded H-Bridge five level Inverter

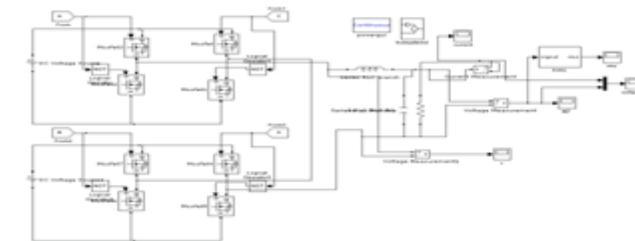

Fig.8 shows the five level inverter CHB simulink circuit

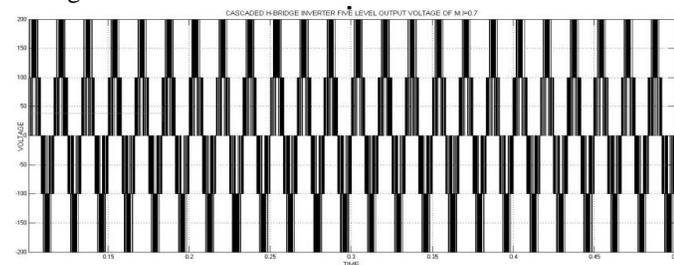

Fig.9 shows the five level output voltage CHB inverter without LC of M.I=0.7

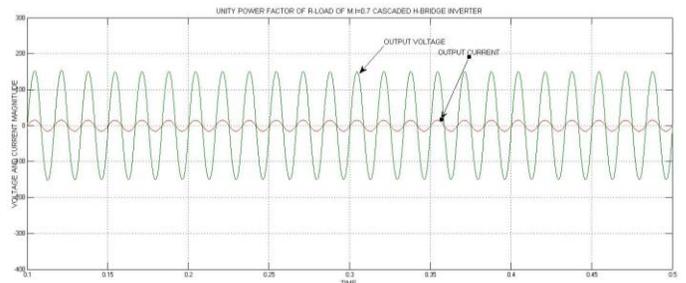

Fig.11 shows the unity power factor at the R-Load with LC filter of CHB inverter of M.I=0.7

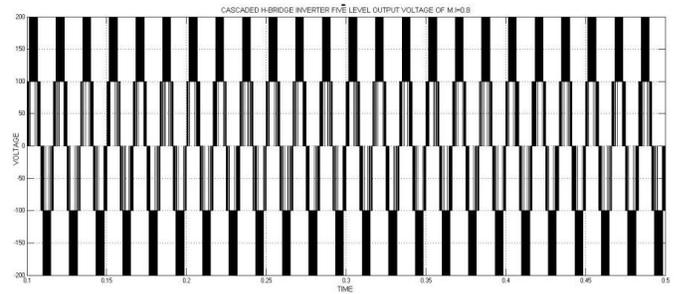

Fig.12 shows the five level output voltage CHB inverter without LC of M.I=0.8

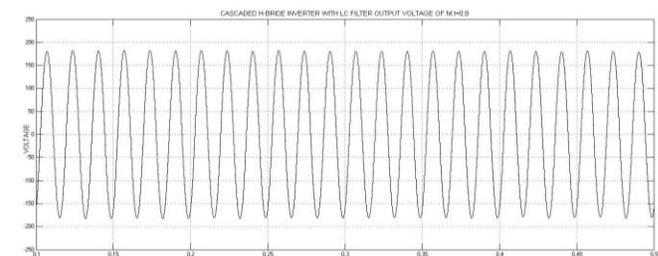

Fig.13 shows the output voltage with LC filter of CHB inverter of M.I=0.8

Fig.14 shows the unity power factor at the R-Load with LC filter of CHB inverter of M.I=0.8

Table-VII
 Harmonics of CHB Inverter with and without LC

The Table VII shows the CHB inverter operating two modulation indexes. They are 0.7 and 0.8 without and with LC filter.

4.2 Simplified Five level Inverter

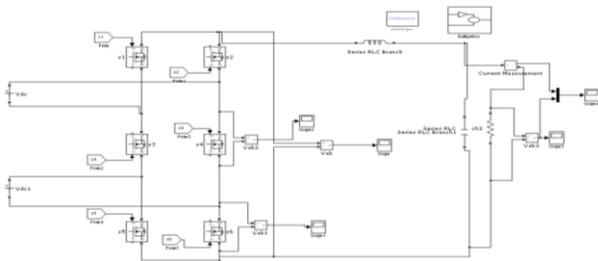

Fig.15. The simulink of simplified five level multilevel inverter

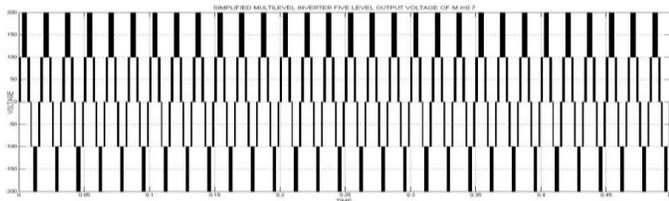

Fig.16 shows the five level output voltage of simplified five level inverter without LC of M.I=0.7

Harmonics	$m_a = 0.7$	$m_a = 0.8$
Fundamental 1	154.02	183.84
h3	2.40	3.31
h5	1.19	0.11
h7	0.24	0.07
h9	0.05	0.20
h11	0.02	0.09
%THD WITHOUT LC	0.146	0.114
%THD WITH LC	0.015	0.013

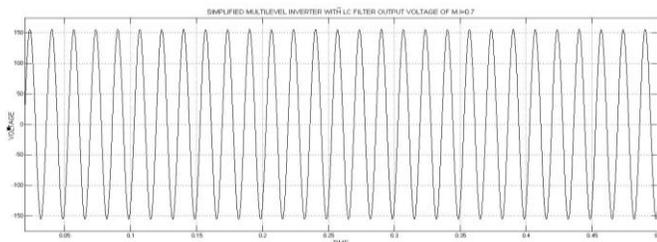

Fig.17 shows the output voltage with LC filter of simplified five level inverter of M.I=0.7

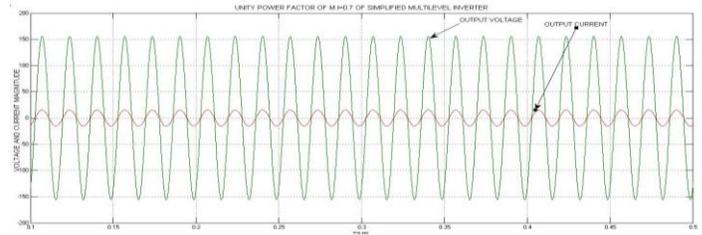

Fig.18 shows the unity power factor at the R-Load with LC filter of simplified five level inverter of M.I=0.7

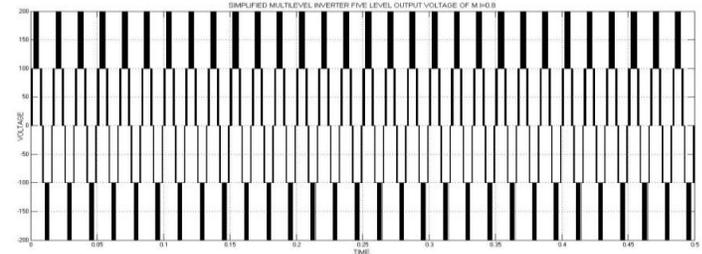

Fig.19 shows the five level output voltage simplified five level inverter without LC of M.I=0.8

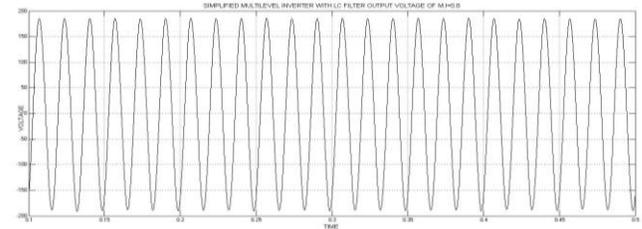

Fig.20 shows the output voltage with LC filter of simplified five level inverter of M.I=0.8

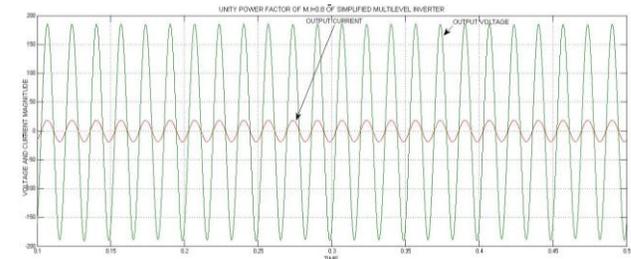

Fig.21 shows the unity power factor at the R-Load with LC filter simplified five level inverter of M.I=0.8

Table-VIII
 Harmonics of Simplified Five Level Inverter with and without LC

Harmonics	$m_a = 0.7$	$m_a = 0.8$
Fundamental 1	157.77	185.66
h3	0.81	1.98
h5	0.25	0.17
h7	0.17	0.32
h9	0.06	0.06
h11	0.07	0.05
%THD WITHOUT LC	0.0701	0.0684
%THD WITH LC	0.005	0.003

The Table VIII shows the simplified five level inverter operating two modulation indexes. They are 0.7 and 0.8 without and with LC filter.

The modulating frequency (Switching frequency) is 18060Hz.

The CHB five level inverter operated with $m_a=0.7$ and $m_a=0.8$ with phase shift carrier pulse width modulation technique then I would get the fundamental component voltage increases and THD value decreases when modulation index $m_a=0.8$ compare to the $m_a=0.7$. The simplified five level inverter operated the same modulation index with phase disposition pulse width modulation technique then I would get the fundamental component voltage increases and THD value decreases compare to the CHB inverter. After clearly understand reduce the number of switches, improved output waveforms, smaller filter size and lower EMI of simplified multistring five level inverter compared to the CHB inverter.

Nine Level	3 rd , 17 th , 19 th , 5 th
Eleven Level	3 rd , 21 st , 23 rd , 5 th , 19 th
Thirteen Level	3 rd , 5 th

V. CONCLUSION

This work reports a Performance analysis of symmetrical and asymmetrical multilevel inverters, so reduce the number of switching devices, reduce the number of DC sources, driving circuits and cost reduces and also THD decreases.

Multistring multilevel inverters have low stress, high conversion efficiency and can also be easily interfaced with renewable energy sources (PV, Fuel cell). Asymmetrical multilevel inverter uses least number of devices to produce higher voltage level. As number of level increases, the THD content approaches to small value as expected. Thus it eliminates the need for filter. Though, THD decreases with increase in number of levels, some lower or higher harmonic contents remain dominant in each level. These will be more dangerous in induction drives.

Hence the future work may be focused to determine the pwm techniques of seven to thirteen level asymmetrical multilevel inverters.

Internal Differentiation, Comparative Variability, Structural Morphology, Normative Aspect of Prognostication of Ipse Dixit NP Hard Problems-A Totalistic Paradigmatic Statement

¹Dr. K. N. Prasanna Kumar, ²Prof. B. S. Kiranagi, ³Prof. C. S. Bagewadi

ABSTRACT: We develop a progressive comparable to Bank's General Ledger, and call it a General Theory of all the problems under the head of NP hard problems. Problems have their variables. For instance "Travelling Sales man problem" can have various different cities. Based upon parameters classification is done and stability analysis, asymptotic stability and Solutional behaviour of the equations are investigated We eschew from stating any primary predications, coextensive representations, predicational anteriority of the Problems attributed to space constraints. In consideration to the parametric based classification and there is both ontological consonance, primordial exactitude, and phenomenological testimony as one finds in Bank's ledgers. General Ledger is in fact the statement of all inflows and outflows and such a one as that occurs in problems and theories in some conditions, like for example the conservation of energy breaking down in Hawking's radiation. Emphasis is laid on the fact that for instance a travelling salesman makes some move and then retracts to redress his move or starts another move to further his final destination. And this destination is General Ledger.-The General Theory Of all the NP (hard) problems. .It is a journey, a journey to find the final balance which probably never ends like an account never closes. So we are on to the journey.....

I. INTRODUCTION

As stated in abstract we will not give any introduction, inconsideration to the leviathans' material and humungous literature on each subject matter for fear of missing woods for trees. On the other hand, for the interested reader the literature provides a rich receptacle, repository and treasure-trove of knowledge. And also because of space constraints. We note that the NP (HARD) problems are classified as follows:

- 1) Boolean satisfiability Problem
- 2) N Puzzle
- 3) Knapsack Problem
- 4) Hamiltonian Path problem
- 5) Travelling Salesman Problem
- 6) Sub graph Isomorphism Problem
- 7) Subset Sum problem
- 8) Clique Problem
- 9) Vertex Cover Problem
- 10) Independent Set problem
- 11) Dominating set problem.
- 12) Graph Coloring Problem

As in a Bank, various parameters are there for an account like balance standing, rate of interest, implications of inflation, money depression, depreciation of the currency, implications of Policies, philosophies and programmes of the Government, each problem has certain parameters. That Gravity is constant does not mean it does not depend upon the masses of individual particles and there is no total gravity. Stratification is done based on the parameters of each problem and then consummated with the other to form a monolithic diaspora for building the Model, which essentially as said is a progressive, nay a General Theory Of all the ways and means in which the problem can be solved be it by invocation or by abnegation and revocation of the action. Everything is recorded in the Computer and we draw up a Final General Ledger-nay The General Theory Of all NP (HARD) Problems. Essentially a prediction model, it as said analyses various other facets too.

Where we suppose 121

(A) $(a_i)^{(1)}, (a'_i)^{(1)}, (a''_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (b''_i)^{(1)} > 0$,
 $i, j = 13, 14, 15$ 122

(B) The functions $(a_i)^{(1)}, (b_i)^{(1)}$ are positive continuous increasing and bounded. 123

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a_i'')^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)} \quad 124$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}$$

$$(C) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)} \quad 125$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants and $i = 13, 14, 15$

They satisfy Lipschitz condition: 126

$$|(a_i'')^{(1)}(T_{14}', t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T_{14}' - T_{14}| e^{-(\hat{M}_{13})^{(1)}t} \quad 127$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, t)| \leq (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(\hat{M}_{13})^{(1)}t} \quad 128$$

With the Lipschitz condition, we place a restriction on the behavior of functions 129

$(a_i'')^{(1)}(T_{14}, t)$ and $(a_i')^{(1)}(T_{14}, t)$. (T_{14}', t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It

is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the first augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants 130

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and 131

$(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15,$ 132

satisfy the inequalities 133

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1 \quad 134$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1 \quad 135$$

Where we suppose

(F) $(a_i)^{(2)}, (a_i')^{(2)}, (a_i'')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (b_i'')^{(2)} > 0, i, j = 16, 17, 18$ 136

(G) The functions $(a_i'')^{(2)}, (b_i'')^{(2)}$ are positive continuous increasing and bounded. 137

Definition of $(p_i)^{(2)}, (r_i)^{(2)}$: 138

$$(a_i'')^{(2)}(T_{17}, t) \leq (p_i)^{(2)} \leq (\hat{A}_{16})^{(2)} \quad 139$$

$$(b_i'')^{(2)}(G_{19}, t) \leq (r_i)^{(2)} \leq (b_i')^{(2)} \leq (\hat{B}_{16})^{(2)} \quad 140$$

$$(H) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(2)}(T_{17}, t) = (p_i)^{(2)} \quad 141$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(2)}(G_{19}, t) = (r_i)^{(2)} \quad 142$$

Definition of $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}$: 143

Where $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}$ are positive constants and $i = 16, 17, 18$ 144

They satisfy Lipschitz condition: 145

$$|(a_i'')^{(2)}(T_{17}', t) - (a_i'')^{(2)}(T_{17}, t)| \leq (\hat{k}_{16})^{(2)} |T_{17}' - T_{17}| e^{-(\hat{M}_{16})^{(2)}t} \quad 146$$

$$|(b_i'')^{(2)}(G_{19}', t) - (b_i'')^{(2)}(G_{19}, t)| \leq (\hat{k}_{16})^{(2)} \|G_{19}' - G_{19}\| e^{-(\hat{M}_{16})^{(2)}t} \quad 147$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(2)}(T_{17}', t)$ and $(a_i'')^{(2)}(T_{17}, t)$ 148

. (T_{17}', t) and (T_{17}, t) are points belonging to the interval $[(\hat{k}_{16})^{(2)}, (\hat{M}_{16})^{(2)}]$. It is to be noted that $(a_i'')^{(2)}(T_{17}, t)$

is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{16})^{(2)} = 1$ then the function $(a_i'')^{(2)}(T_{17}, t)$, the SECOND augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$:

(I) $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$, are positive constants 149

$$\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1 \quad 150$$

Definition of $(\hat{P}_{16})^{(2)}, (\hat{Q}_{16})^{(2)}$:

There exists two constants $(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ which together with $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}, (\hat{A}_{16})^{(2)}$ and $(\hat{B}_{16})^{(2)}$ 151

and the constants $(a_i)^{(2)}, (a_i')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}, i = 16, 17, 18,$

satisfy the inequalities

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(a_i)^{(2)} + (a_i')^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \quad 152$$

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(b_i)^{(2)} + (b_i')^{(2)} + (\hat{B}_{16})^{(2)} + (\hat{Q}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \quad 153$$

Where we suppose

(J) $(a_i)^{(3)}, (a_i')^{(3)}, (a_i'')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (b_i'')^{(3)} > 0, \quad i, j = 20, 21, 22$

The functions $(a_i'')^{(3)}, (b_i'')^{(3)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(3)}, (r_i)^{(3)}$:

$$(a_i'')^{(3)}(T_{21}, t) \leq (p_i)^{(3)} \leq (\hat{A}_{20})^{(3)}$$

$$(b_i'')^{(3)}(G, t) \leq (r_i)^{(3)} \leq (b_i')^{(3)} \leq (\hat{B}_{20})^{(3)}$$

$\lim_{T_2 \rightarrow \infty} (a_i'')^{(3)}(T_{21}, t) = (p_i)^{(3)}$

$\lim_{G \rightarrow \infty} (b_i'')^{(3)}(G, t) = (r_i)^{(3)}$

Definition of $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}$:

Where $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}$ are positive constants and $i = 20, 21, 22$

They satisfy Lipschitz condition:

$$|(a_i'')^{(3)}(T_{21}, t) - (a_i'')^{(3)}(T_{21}, t)| \leq (\hat{k}_{20})^{(3)} |T_{21} - T_{21}'| e^{-(\hat{M}_{20})^{(3)}t}$$

$$|(b_i'')^{(3)}(G', t) - (b_i'')^{(3)}(G, T)| < (\hat{k}_{20})^{(3)} \|G - G'\| e^{-(\hat{M}_{20})^{(3)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(3)}(T_{21}, t)$ and $(a_i'')^{(3)}(T_{21}, t)$. (T_{21}', t) and (T_{21}, t) are points belonging to the interval $[(\hat{k}_{20})^{(3)}, (\hat{M}_{20})^{(3)}]$. It is to be noted that

$(a_i'')^{(3)}(T_{21}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{20})^{(3)} = 1$ then the function $(a_i'')^{(3)}(T_{21}, t)$, the third augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$:

(K) $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$, are positive constants

$$\frac{(a_i)^{(3)}}{(\hat{M}_{20})^{(3)}} + \frac{(b_i)^{(3)}}{(\hat{M}_{20})^{(3)}} < 1$$

There exists two constants There exists two constants $(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ which together with $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}, (\hat{A}_{20})^{(3)}$ and $(\hat{B}_{20})^{(3)}$ and the constants $(a_i)^{(3)}, (a_i')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}, i = 20, 21, 22,$

satisfy the inequalities

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(a_i)^{(3)} + (a_i')^{(3)} + (\hat{A}_{20})^{(3)} + (\hat{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1$$

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b_i')^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1$$

Where we suppose

(L) $(a_i)^{(4)}, (a_i')^{(4)}, (a_i'')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (b_i'')^{(4)} > 0, \quad i, j = 24, 25, 26$

(M) The functions $(a_i'')^{(4)}, (b_i'')^{(4)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(4)}, (r_i)^{(4)}$:

$$(a_i'')^{(4)}(T_{25}, t) \leq (p_i)^{(4)} \leq (\hat{A}_{24})^{(4)}$$

$$(b_i'')^{(4)}((G_{27}), t) \leq (r_i)^{(4)} \leq (b_i')^{(4)} \leq (\hat{B}_{24})^{(4)}$$

(N) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(4)}(T_{25}, t) = (p_i)^{(4)}$

$\lim_{G \rightarrow \infty} (b_i'')^{(4)}((G_{27}), t) = (r_i)^{(4)}$

Definition of $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}$:

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$

They satisfy Lipschitz condition:

$$|(a_i'')^{(4)}(T_{25}, t) - (a_i'')^{(4)}(T_{25}, t)| \leq (\hat{k}_{24})^{(4)} |T_{25} - T_{25}'| e^{-(\hat{M}_{24})^{(4)}t}$$

$$|(b_i'')^{(4)}((G_{27})', t) - (b_i'')^{(4)}((G_{27}), T)| < (\hat{k}_{24})^{(4)} \|(G_{27}) - (G_{27}')\| e^{-(\hat{M}_{24})^{(4)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(4)}(T_{25}, t)$ and $(a_i'')^{(4)}(T_{25}, t)$. (T_{25}', t) and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that $(a_i'')^{(4)}(T_{25}, t)$

is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function $(a_i'')^{(4)}(T_{25}, t)$, the fourth augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

(O) $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}} + \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

(Q) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}, (\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}, (a_i')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}, i = 24, 25, 26,$

satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a'_i)^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b'_i)^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

Where we suppose

$$(R) \quad (a_i)^{(5)}, (a'_i)^{(5)}, (a''_i)^{(5)}, (b_i)^{(5)}, (b'_i)^{(5)}, (b''_i)^{(5)} > 0, \quad i, j = 28, 29, 30$$

(S) The functions $(a''_i)^{(5)}, (b''_i)^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}, (r_i)^{(5)}$:

$$(a''_i)^{(5)}(T_{29}, t) \leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)}$$

$$(b''_i)^{(5)}(G_{31}, t) \leq (r_i)^{(5)} \leq (b'_i)^{(5)} \leq (\hat{B}_{28})^{(5)}$$

$$(T) \quad \lim_{T_2 \rightarrow \infty} (a''_i)^{(5)}(T_{29}, t) = (p_i)^{(5)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(5)}(G_{31}, t) = (r_i)^{(5)}$$

Definition of $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}$:

Where $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}$ are positive constants and $i = 28, 29, 30$

They satisfy Lipschitz condition:

$$|(a''_i)^{(5)}(T'_{29}, t) - (a''_i)^{(5)}(T_{29}, t)| \leq (\hat{k}_{28})^{(5)} |T'_{29} - T_{29}| e^{-(\hat{M}_{28})^{(5)}t}$$

$$|(b''_i)^{(5)}((G'_{31}), t) - (b''_i)^{(5)}((G_{31}), (T_{31}))| < (\hat{k}_{28})^{(5)} |(G'_{31}) - (G_{31})'| e^{-(\hat{M}_{28})^{(5)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(5)}(T'_{29}, t)$ and $(a''_i)^{(5)}(T_{29}, t)$. (T'_{29}, t) and (T_{29}, t) are points belonging to the interval $[(\hat{k}_{28})^{(5)}, (\hat{M}_{28})^{(5)}]$. It is to be noted that $(a''_i)^{(5)}(T_{29}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{28})^{(5)} = 5$ then the function $(a''_i)^{(5)}(T_{29}, t)$, the fifth **augmentation coefficient** would be absolutely continuous.

Definition of $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$:

(U) $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$, are positive constants

$$\frac{(a_i)^{(5)}}{(\hat{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\hat{M}_{28})^{(5)}} < 1$$

Definition of $(\hat{P}_{28})^{(5)}, (\hat{Q}_{28})^{(5)}$:

(V) There exists two constants $(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ which together with $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}, (\hat{A}_{28})^{(5)}$ and $(\hat{B}_{28})^{(5)}$ and the constants $(a_i)^{(5)}, (a'_i)^{(5)}, (b_i)^{(5)}, (b'_i)^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}, i = 28, 29, 30$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(a_i)^{(5)} + (a'_i)^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(b_i)^{(5)} + (b'_i)^{(5)} + (\hat{B}_{28})^{(5)} + (\hat{Q}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

Where we suppose

$$(a_i)^{(6)}, (a'_i)^{(6)}, (a''_i)^{(6)}, (b_i)^{(6)}, (b'_i)^{(6)}, (b''_i)^{(6)} > 0, \quad i, j = 32, 33, 34$$

(W) The functions $(a''_i)^{(6)}, (b''_i)^{(6)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(6)}, (r_i)^{(6)}$:

$$(a''_i)^{(6)}(T_{33}, t) \leq (p_i)^{(6)} \leq (\hat{A}_{32})^{(6)}$$

$$(b''_i)^{(6)}(G_{35}, t) \leq (r_i)^{(6)} \leq (b'_i)^{(6)} \leq (\hat{B}_{32})^{(6)}$$

$$(X) \quad \lim_{T_2 \rightarrow \infty} (a''_i)^{(6)}(T_{33}, t) = (p_i)^{(6)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(6)}(G_{35}, t) = (r_i)^{(6)}$$

Definition of $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}$:

Where $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}$ are positive constants and $i = 32, 33, 34$

They satisfy Lipschitz condition:

$$|(a''_i)^{(6)}(T'_{33}, t) - (a''_i)^{(6)}(T_{33}, t)| \leq (\hat{k}_{32})^{(6)} |T'_{33} - T_{33}| e^{-(\hat{M}_{32})^{(6)}t}$$

$$|(b''_i)^{(6)}((G'_{35}), t) - (b''_i)^{(6)}((G_{35}), (T_{35}))| < (\hat{k}_{32})^{(6)} |(G'_{35}) - (G_{35})'| e^{-(\hat{M}_{32})^{(6)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(6)}(T'_{33}, t)$ and $(a''_i)^{(6)}(T_{33}, t)$. (T'_{33}, t) and (T_{33}, t) are points belonging to the interval $[(\hat{k}_{32})^{(6)}, (\hat{M}_{32})^{(6)}]$. It is to be noted that $(a''_i)^{(6)}(T_{33}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{32})^{(6)} = 6$ then the function $(a''_i)^{(6)}(T_{33}, t)$, the sixth **augmentation coefficient** would be absolutely continuous.

Definition of $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$:

$(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$, are positive constants

$$\frac{(a_i)^{(6)}}{(\hat{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\hat{M}_{32})^{(6)}} < 1$$

Definition of $(\hat{P}_{32})^{(6)}, (\hat{Q}_{32})^{(6)}$:

There exists two constants $(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ which together with $(\hat{M}_{32})^{(6)}$, $(\hat{k}_{32})^{(6)}$, $(\hat{A}_{32})^{(6)}$ and $(\hat{B}_{32})^{(6)}$ and the constants $(a_i)^{(6)}$, $(a'_i)^{(6)}$, $(b_i)^{(6)}$, $(b'_i)^{(6)}$, $(p_i)^{(6)}$, $(r_i)^{(6)}$, $i = 32, 33, 34$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(a_i)^{(6)} + (a'_i)^{(6)} + (\hat{A}_{32})^{(6)} + (\hat{P}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(b_i)^{(6)} + (b'_i)^{(6)} + (\hat{B}_{32})^{(6)} + (\hat{Q}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

Theorem 1: if the conditions (A)-(E) (first five conditions related to the system Boolean satisfiability problem) above are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

If the conditions of second module pertaining to Knapsack problem and Hamiltonian Path Problem above are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$

$$G_i(t) \leq (\hat{P}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}t}, \quad G_i(0) = G_i^0 > 0$$

$$T_i(t) \leq (\hat{Q}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}t}, \quad T_i(0) = T_i^0 > 0$$

If the conditions pertaining to the third module Sub graph Isomorphism problem and Subset sum problem above are fulfilled, there exists a solution satisfying the conditions

$$G_i(t) \leq (\hat{P}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)}t}, \quad G_i(0) = G_i^0 > 0$$

$$T_i(t) \leq (\hat{Q}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)}t}, \quad T_i(0) = T_i^0 > 0$$

If the conditions of the fourth module Subset Sum Problem and Clique problem above are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{24})^{(4)} e^{(\hat{M}_{24})^{(4)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{24})^{(4)} e^{(\hat{M}_{24})^{(4)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

If the conditions pertaining to the module five namely Vertex Cover Problem and Independent Set problem are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

If the conditions pertaining to Dominating set problem and Graph Coloring Problem above are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof:

Consider operator $\mathcal{A}^{(1)}$ defined on the space of sextuples of continuous functions $G_i, T_i: \mathbb{R}_+ \rightarrow \mathbb{R}_+$ which satisfy

$$G_i(0) = G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{13})^{(1)}, T_i^0 \leq (\hat{Q}_{13})^{(1)},$$

$$0 \leq G_i(t) - G_i^0 \leq (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}t}$$

$$0 \leq T_i(t) - T_i^0 \leq (\hat{Q}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}t}$$

By

$$\bar{G}_{13}(t) = G_{13}^0 + \int_0^t [(a_{13})^{(1)} G_{14}(s_{13}) - ((a'_{13})^{(1)} + a''_{13})^{(1)} (T_{14}(s_{13}), s_{13})) G_{13}(s_{13})] ds_{13}$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$ 267

(a) The operator $\mathcal{A}^{(1)}$ maps the space of functions satisfying into itself .Indeed it is obvious that 268

$$G_{13}(t) \leq G_{13}^0 + \int_0^t \left[(a_{13})^{(1)} \left(G_{14}^0 + (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}s_{(13)}} \right) \right] ds_{(13)} =$$

$$\left(1 + (a_{13})^{(1)}t \right) G_{14}^0 + \frac{(a_{13})^{(1)}(\hat{P}_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left(e^{(\hat{M}_{13})^{(1)}t} - 1 \right)$$

From which it follows that 269

$$(G_{13}(t) - G_{13}^0) e^{-(\hat{M}_{13})^{(1)}t} \leq \frac{(a_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{P}_{13})^{(1)} + G_{14}^0 \right) e^{\left(-\frac{(\hat{P}_{13})^{(1)} + G_{14}^0}{\hat{M}_{13}^{(1)}} \right)t} + (\hat{P}_{13})^{(1)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{14}, G_{15}, T_{13}, T_{14}, T_{15}$ 270

(b) The operator $\mathcal{A}^{(2)}$ maps the space of functions satisfying into itself .Indeed it is obvious that 271

$$G_{16}(t) \leq G_{16}^0 + \int_0^t \left[(a_{16})^{(2)} \left(G_{17}^0 + (\hat{P}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}s_{(16)}} \right) \right] ds_{(16)} = \quad 272$$

$$\left(1 + (a_{16})^{(2)}t \right) G_{17}^0 + \frac{(a_{16})^{(2)}(\hat{P}_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left(e^{(\hat{M}_{16})^{(2)}t} - 1 \right)$$

From which it follows that 273

$$(G_{16}(t) - G_{16}^0) e^{-(\hat{M}_{16})^{(2)}t} \leq \frac{(a_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left[\left((\hat{P}_{16})^{(2)} + G_{17}^0 \right) e^{\left(-\frac{(\hat{P}_{16})^{(2)} + G_{17}^0}{\hat{M}_{16}^{(2)}} \right)t} + (\hat{P}_{16})^{(2)} \right]$$

Analogous inequalities hold also for $G_{17}, G_{18}, T_{16}, T_{17}, T_{18}$ 274

(a) The operator $\mathcal{A}^{(3)}$ maps the space of functions satisfying into itself .Indeed it is obvious that 275

$$G_{20}(t) \leq G_{20}^0 + \int_0^t \left[(a_{20})^{(3)} \left(G_{21}^0 + (\hat{P}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)}s_{(20)}} \right) \right] ds_{(20)} =$$

$$\left(1 + (a_{20})^{(3)}t \right) G_{21}^0 + \frac{(a_{20})^{(3)}(\hat{P}_{20})^{(3)}}{(\hat{M}_{20})^{(3)}} \left(e^{(\hat{M}_{20})^{(3)}t} - 1 \right)$$

From which it follows that

$$(G_{20}(t) - G_{20}^0)e^{-(M_{20})^{(3)}t} \leq \frac{(a_{20})^{(3)}}{(M_{20})^{(3)}} \left[((\hat{P}_{20})^{(3)} + G_{21}^0)e^{-\frac{(\hat{P}_{20})^{(3)} + G_{21}^0}{G_{21}^0}} + (\hat{P}_{20})^{(3)} \right] \quad 276$$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$ 278

(b) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying into itself. Indeed it is obvious that 279

$$G_{24}(t) \leq G_{24}^0 + \int_0^t \left[(a_{24})^{(4)} \left(G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(M_{24})^{(4)}s} \right) \right] ds_{(24)} =$$

$$(1 + (a_{24})^{(4)}t)G_{25}^0 + \frac{(a_{24})^{(4)}(\hat{P}_{24})^{(4)}}{(M_{24})^{(4)}} \left(e^{(M_{24})^{(4)}t} - 1 \right)$$

From which it follows that

$$(G_{24}(t) - G_{24}^0)e^{-(M_{24})^{(4)}t} \leq \frac{(a_{24})^{(4)}}{(M_{24})^{(4)}} \left[((\hat{P}_{24})^{(4)} + G_{25}^0)e^{-\frac{(\hat{P}_{24})^{(4)} + G_{25}^0}{G_{25}^0}} + (\hat{P}_{24})^{(4)} \right] \quad 280$$

(G_i^0) is as defined in the statement of theorem 4

(c) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying 35,35,36 into itself. Indeed it is obvious that 281

$$G_{28}(t) \leq G_{28}^0 + \int_0^t \left[(a_{28})^{(5)} \left(G_{29}^0 + (\hat{P}_{28})^{(5)} e^{(M_{28})^{(5)}s} \right) \right] ds_{(28)} =$$

$$(1 + (a_{28})^{(5)}t)G_{29}^0 + \frac{(a_{28})^{(5)}(\hat{P}_{28})^{(5)}}{(M_{28})^{(5)}} \left(e^{(M_{28})^{(5)}t} - 1 \right)$$

From which it follows that

$$(G_{28}(t) - G_{28}^0)e^{-(M_{28})^{(5)}t} \leq \frac{(a_{28})^{(5)}}{(M_{28})^{(5)}} \left[((\hat{P}_{28})^{(5)} + G_{29}^0)e^{-\frac{(\hat{P}_{28})^{(5)} + G_{29}^0}{G_{29}^0}} + (\hat{P}_{28})^{(5)} \right] \quad 282$$

(G_i^0) is as defined in the statement of theorem 1

(d) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying 34,35,36 into itself. Indeed it is obvious that 283

$$G_{32}(t) \leq G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} \left(G_{33}^0 + (\hat{P}_{32})^{(6)} e^{(M_{32})^{(6)}s} \right) \right] ds_{(32)} =$$

$$(1 + (a_{32})^{(6)}t)G_{33}^0 + \frac{(a_{32})^{(6)}(\hat{P}_{32})^{(6)}}{(M_{32})^{(6)}} \left(e^{(M_{32})^{(6)}t} - 1 \right)$$

From which it follows that

$$(G_{32}(t) - G_{32}^0)e^{-(M_{32})^{(6)}t} \leq \frac{(a_{32})^{(6)}}{(M_{32})^{(6)}} \left[((\hat{P}_{32})^{(6)} + G_{33}^0)e^{-\frac{(\hat{P}_{32})^{(6)} + G_{33}^0}{G_{33}^0}} + (\hat{P}_{32})^{(6)} \right] \quad 284$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$

It is now sufficient to take $\frac{(a_i)^{(1)}}{(M_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(M_{13})^{(1)}} < 1$ and to choose

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have

$$\frac{(a_i)^{(1)}}{(M_{13})^{(1)}} \left[(\hat{P}_{13})^{(1)} + \left((\hat{P}_{13})^{(1)} + G_j^0 \right) e^{-\frac{(\hat{P}_{13})^{(1)} + G_j^0}{G_j^0}} \right] \leq (\hat{P}_{13})^{(1)} \quad 288$$

$$\frac{(b_i)^{(1)}}{(M_{13})^{(1)}} \left[((\hat{Q}_{13})^{(1)} + T_j^0) e^{-\frac{(\hat{Q}_{13})^{(1)} + T_j^0}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)} \quad 289$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i into itself

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric

$$d\left((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{13})^{(1)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{13})^{(1)}t} \right\}$$

Indeed if we denote

Definition of \tilde{G}, \tilde{T} :

$$(\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_i^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(M_{13})^{(1)}s} e^{(M_{13})^{(1)}s} ds_{(13)} +$$

$$\int_0^t \left\{ (a_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(M_{13})^{(1)}s} e^{-(M_{13})^{(1)}s} + \right.$$

$$(a_{13}'')^{(1)}(T_{14}^{(1)}, s_{(13)}) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(M_{13})^{(1)}s} e^{(M_{13})^{(1)}s} +$$

$$\left. G_{13}^{(2)} |(a_{13}'')^{(1)}(T_{14}^{(1)}, s_{(13)}) - (a_{13}'')^{(1)}(T_{14}^{(2)}, s_{(13)})| e^{-(M_{13})^{(1)}s} e^{(M_{13})^{(1)}s} \right\} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|G^{(1)} - G^{(2)}| e^{-(\widehat{M}_{13})^{(1)}t} \leq \frac{1}{(\widehat{M}_{13})^{(1)}} ((a_{13})^{(1)} + (a'_{13})^{(1)} + (\widehat{A}_{13})^{(1)} + (\widehat{P}_{13})^{(1)}(\widehat{k}_{13})^{(1)}) d((G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)})) \quad 293$$

And analogous inequalities for G_i and T_i . Taking into account the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ and $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of \mathbb{R}_+ . 294

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(1)}$ and $(b''_i)^{(1)}$, $i = 13, 14, 15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 295

From the governing equations of the holistic system it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(1)} - (a''_i)^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(1)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{13})^{(1)})_1, ((\widehat{M}_{13})^{(1)})_2$ and $((\widehat{M}_{13})^{(1)})_3$: 296

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$G_{13} < (\widehat{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq ((\widehat{M}_{13})^{(1)})_1 - (a'_{14})^{(1)}G_{14}$ and by integrating

$$G_{14} \leq ((\widehat{M}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)}((\widehat{M}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\widehat{M}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)}((\widehat{M}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 297

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(1)}(G(t), t)) = (b'_{14})^{(1)}$ then $T_{14} \rightarrow \infty$. 298

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b''_i)^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to 299

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t \rightarrow \infty} (b''_{15})^{(1)}(G(t), t) = (b'_{15})^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations solution to the governing equations of the global system

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose 300
301

$(\widehat{P}_{16})^{(2)}$ and $(\widehat{Q}_{16})^{(2)}$ large to have

$$\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} \left[(\widehat{P}_{16})^{(2)} + ((\widehat{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{16})^{(2)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{16})^{(2)} \quad 302$$

$$\frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} \left[((\widehat{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{16})^{(2)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{16})^{(2)} \right] \leq (\widehat{Q}_{16})^{(2)} \quad 303$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i into itself 306

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric 307

$$d(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)})) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{16})^{(2)}t} \right\}$$

Indeed if we denote 308

Definition of $\widetilde{G}_{19}, \widetilde{T}_{19}$: $(\widetilde{G}_{19}, \widetilde{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19})$

It results 309

$$|\widetilde{G}_{16}^{(1)} - \widetilde{G}_{16}^{(2)}| \leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\widehat{M}_{16})^{(2)}s_{(16)}} e^{(\widehat{M}_{16})^{(2)}s_{(16)}} ds_{(16)} +$$

$$\int_0^t \{ (a'_{16})^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)} s_{(16)}} e^{-(\bar{M}_{16})^{(2)} s_{(16)}} + (a''_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)} s_{(16)}} e^{(\bar{M}_{16})^{(2)} s_{(16)}} + G_{16}^{(2)} | (a'_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) - (a''_{16})^{(2)} (T_{17}^{(2)}, s_{(16)}) | e^{-(\bar{M}_{16})^{(2)} s_{(16)}} e^{(\bar{M}_{16})^{(2)} s_{(16)}} \} ds_{(16)}$$

310

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$
 From the hypotheses it follows

$$|(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\bar{M}_{16})^{(2)} t} \leq \frac{1}{(\bar{M}_{16})^{(2)}} \left((a_{16})^{(2)} + (a'_{16})^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)} \right) d \left(((G_{19})^{(1)}, (T_{19})^{(1)}), (G_{19})^{(2)}, (T_{19})^{(2)} \right)$$

311

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (34,35,36) the result follows

312

Remark 1: The fact that we supposed $(a'_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)} t}$ and $(\hat{Q}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)} t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i)^{(2)}$ and $(b_i)^{(2)}$, $i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$
 From 19 to 24 it results

314

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i)^{(2)} - (a_i)^{(2)} (T_{17}(s_{(16)}), s_{(16)}) \} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i)^{(2)} t} > 0 \quad \text{for } t > 0$$

Definition of $((\bar{M}_{16})^{(2)})_1$, $((\bar{M}_{16})^{(2)})_2$ and $((\bar{M}_{16})^{(2)})_3$:

315

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if $G_{16} < ((\bar{M}_{16})^{(2)})$ it follows $\frac{dG_{17}}{dt} \leq ((\bar{M}_{16})^{(2)})_1 - (a'_{17})^{(2)} G_{17}$ and by integrating $G_{17} \leq ((\bar{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)} ((\bar{M}_{16})^{(2)})_1 / (a'_{17})^{(2)}$

In the same way, one can obtain $G_{18} \leq ((\bar{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)} ((\bar{M}_{16})^{(2)})_2 / (a'_{18})^{(2)}$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively.
Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below.

316

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i)^{(2)} ((G_{19})(t), t)) = (b'_{17})^{(2)}$ then $T_{17} \rightarrow \infty$.

317

Definition of $(m)^{(2)}$ and ε_2 :
 Indeed let t_2 be so that for $t > t_2$
 $(b_{17})^{(2)} - (b_i)^{(2)} ((G_{19})(t), t) < \varepsilon_2$, $T_{16}(t) > (m)^{(2)}$
 Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)} (m)^{(2)} - \varepsilon_2 T_{17}$ which leads to

318

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \quad \text{If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_2} \quad \text{By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The same property holds for } T_{18} \text{ if } \lim_{t \rightarrow \infty} (b''_{18})^{(2)} ((G_{19})(t), t) = (b'_{18})^{(2)}$$

319

We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 42

320

It is now sufficient to take $\frac{(a_i)^{(3)}}{(\bar{M}_{20})^{(3)}} , \frac{(b_i)^{(3)}}{(\bar{M}_{20})^{(3)}} < 1$ and to choose

321

$(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ large to have

$$\frac{(a_i)^{(3)}}{(\bar{M}_{20})^{(3)}} \left[(\hat{P}_{20})^{(3)} + ((\hat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\hat{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{20})^{(3)}$$

322

$$\frac{(b_i)^{(3)}}{(\bar{M}_{20})^{(3)}} \left[((\hat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{20})^{(3)} \right] \leq (\hat{Q}_{20})^{(3)}$$

323

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i into itself
 The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric

324

$$d \left(((G_{23})^{(1)}, (T_{23})^{(1)}), ((G_{23})^{(2)}, (T_{23})^{(2)}) \right) = \sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)} t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)} t} \}$$

Indeed if we denote

Definition of $\widetilde{G}_{23}, \widetilde{T}_{23} : ((\widetilde{G}_{23}), (\widetilde{T}_{23})) = \mathcal{A}^{(3)}((G_{23}), (T_{23}))$

326

It results

$$|\widetilde{G}_{20}^{(1)} - \widetilde{G}_i^{(2)}| \leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}} ds_{(20)} + \int_0^t \{(a'_{20})^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{-(\overline{M}_{20})^{(3)}s_{(20)}} + (a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}} + G_{20}^{(2)} |(a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a''_{20})^{(3)} (T_{21}^{(2)}, s_{(20)})| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}}\} ds_{(20)}$$

327

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|G^{(1)} - G^{(2)}| e^{-(\overline{M}_{20})^{(3)}t} \leq \frac{1}{(\overline{M}_{20})^{(3)}} ((a_{20})^{(3)} + (a'_{20})^{(3)} + (\widehat{A}_{20})^{(3)} + (\widehat{P}_{20})^{(3)} (\widehat{k}_{20})^{(3)}) d(((G_{23})^{(1)}, (T_{23})^{(1)}); (G_{23})^{(2)}, (T_{23})^{(2)}))$$

328

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{20})^{(3)}$ and $(b''_{20})^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{20})^{(3)} e^{(\overline{M}_{20})^{(3)}t}$ and $(\widehat{Q}_{20})^{(3)} e^{(\overline{M}_{20})^{(3)}t}$ respectively of \mathbb{R}_+ .

329

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$, $i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

330

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(3)} - (a''_i)^{(3)}\} (T_{21}(s_{(20)}), s_{(20)}) ds_{(20)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(3)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{20})^{(3)})_1, ((\widehat{M}_{20})^{(3)})_2$ and $((\widehat{M}_{20})^{(3)})_3$:

331

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$G_{20} < (\widehat{M}_{20})^{(3)}$ it follows $\frac{dG_{21}}{dt} \leq ((\widehat{M}_{20})^{(3)})_1 - (a'_{21})^{(3)} G_{21}$ and by integrating

$$G_{21} \leq ((\widehat{M}_{20})^{(3)})_2 = G_{21}^0 + 2(a_{21})^{(3)} ((\widehat{M}_{20})^{(3)})_1 / (a'_{21})^{(3)}$$

332

In the same way, one can obtain

$$G_{22} \leq ((\widehat{M}_{20})^{(3)})_3 = G_{22}^0 + 2(a_{22})^{(3)} ((\widehat{M}_{20})^{(3)})_2 / (a'_{22})^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively.

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below.

333

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(3)} ((G_{23})(t), t)) = (b'_{21})^{(3)}$ then $T_{21} \rightarrow \infty$.

334

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$

$$(b_{21})^{(3)} - (b'_i)^{(3)} ((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)}$$

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)} (m)^{(3)} - \varepsilon_3 T_{21}$ which leads to

335

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{2} \right), t = \log \frac{2}{\varepsilon_3} \text{ By taking now } \varepsilon_3 \text{ sufficiently small one sees that } T_{21} \text{ is unbounded. The same}$$

property holds for T_{22} if $\lim_{t \rightarrow \infty} ((b''_{22})^{(3)} ((G_{23})(t), t)) = (b'_{22})^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions:

336

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\widehat{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} < 1$ and to choose

337

$(\widehat{P}_{24})^{(4)}$ and $(\widehat{Q}_{24})^{(4)}$ large to have

$$\frac{(a_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[(\widehat{P}_{24})^{(4)} + ((\widehat{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{24})^{(4)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{24})^{(4)}$$

338

$$\frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[((\widehat{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{24})^{(4)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{24})^{(4)} \right] \leq (\widehat{Q}_{24})^{(4)}$$

339

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i into itself 340

The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric 341

$$d\left(\left((G_{27})^{(1)}, (T_{27})^{(1)}\right), \left((G_{27})^{(2)}, (T_{27})^{(2)}\right)\right) = \sup_{t \in \mathbb{R}_+} \left\{ \max_i |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\overline{M}_{24})^{(4)}t}, \max_i |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\overline{M}_{24})^{(4)}t} \right\}$$

Indeed if we denote 342

Definition of $(\overline{G_{27}}), (\overline{T_{27}}) : ((\overline{G_{27}}), (\overline{T_{27}})) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$

It results

$$\begin{aligned} |\overline{G_{24}}^{(1)} - \overline{G_{24}}^{(2)}| &\leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\overline{M}_{24})^{(4)}s_{(24)}} e^{(\overline{M}_{24})^{(4)}s_{(24)}} ds_{(24)} + \\ &\int_0^t \{ (a'_{24})^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\overline{M}_{24})^{(4)}s_{(24)}} e^{-(\overline{M}_{24})^{(4)}s_{(24)}} + \\ &(a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\overline{M}_{24})^{(4)}s_{(24)}} e^{(\overline{M}_{24})^{(4)}s_{(24)}} + \\ &G_{24}^{(2)} | (a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) - (a''_{24})^{(4)} (T_{25}^{(2)}, s_{(24)}) | e^{-(\overline{M}_{24})^{(4)}s_{(24)}} e^{(\overline{M}_{24})^{(4)}s_{(24)}} \} ds_{(24)} \end{aligned}$$

Where $s_{(24)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\overline{M}_{24})^{(4)}t} \leq \frac{1}{(\overline{M}_{24})^{(4)}} \left((a_{24})^{(4)} + (a'_{24})^{(4)} + (\widehat{A}_{24})^{(4)} + (\widehat{P}_{24})^{(4)} (\widehat{k}_{24})^{(4)} \right) d\left(\left((G_{27})^{(1)}, (T_{27})^{(1)}\right); (G_{27})^{(2)}, (T_{27})^{(2)}\right) \quad 343$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{24})^{(4)}$ and $(b''_{24})^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{24})^{(4)} e^{(\overline{M}_{24})^{(4)}t}$ and $(\widehat{Q}_{24})^{(4)} e^{(\overline{M}_{24})^{(4)}t}$ respectively of \mathbb{R}_+ . 344

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(4)}$ and $(b''_i)^{(4)}$, $i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 345

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(4)} - (a''_i)^{(4)} (T_{25}(s_{(24)}), s_{(24)}) \} ds_{(24)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(4)}t} > 0 \text{ for } t > 0$$

Definition of $((\overline{M}_{24})^{(4)})_1, ((\overline{M}_{24})^{(4)})_2$ and $((\overline{M}_{24})^{(4)})_3$: 346

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$$G_{24} < (\overline{M}_{24})^{(4)} \text{ it follows } \frac{dG_{25}}{dt} \leq ((\overline{M}_{24})^{(4)})_1 - (a'_{25})^{(4)} G_{25} \text{ and by integrating}$$

$$G_{25} \leq ((\overline{M}_{24})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)} ((\overline{M}_{24})^{(4)})_1 / (a'_{25})^{(4)}$$

In the same way, one can obtain

$$G_{26} \leq ((\overline{M}_{24})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)} ((\overline{M}_{24})^{(4)})_2 / (a'_{26})^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24} , G_{26} and G_{24} , G_{25} respectively.

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below. 347

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(4)}((G_{27})(t), t)) = (b'_{25})^{(4)}$ then $T_{25} \rightarrow \infty$. 348

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25})^{(4)} - (b''_i)^{(4)}((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)}$$

Then $\frac{dT_{25}}{dt} \geq (a_{25})^{(4)}(m)^{(4)} - \varepsilon_4 T_{25}$ which leads to 349

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_4} \text{ By taking now } \varepsilon_4 \text{ sufficiently small one sees that } T_{25} \text{ is unbounded. The same}$$

property holds for T_{26} if $\lim_{t \rightarrow \infty} (b''_{26})^{(4)}((G_{27})(t), t) = (b'_{26})^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ;

Analogous inequalities hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$

350

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\overline{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\overline{M}_{28})^{(5)}} < 1$ and to choose $(\widehat{P}_{28})^{(5)}$ and $(\widehat{Q}_{28})^{(5)}$ large to have

351

$$\frac{(a_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[(\widehat{P}_{28})^{(5)} + ((\widehat{P}_{28})^{(5)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{28})^{(5)} + G_j^0}{G_j^0}\right)} \right] \leq (\widehat{P}_{28})^{(5)} \tag{352}$$

$$\frac{(b_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[((\widehat{Q}_{28})^{(5)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{28})^{(5)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{28})^{(5)} \right] \leq (\widehat{Q}_{28})^{(5)} \tag{353}$$

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i into itself 354

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric 355

$$d \left(((G_{31})^{(1)}, (T_{31})^{(1)}), ((G_{31})^{(2)}, (T_{31})^{(2)}) \right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t} \right\}$$

Indeed if we denote **Definition of** $(\widehat{G}_{31}), (\widehat{T}_{31}) : ((\widehat{G}_{31}), (\widehat{T}_{31})) = \mathcal{A}^{(5)}((G_{31}), (T_{31}))$ 356

It results

$$\begin{aligned} |\widehat{G}_{28}^{(1)} - \widehat{G}_i^{(2)}| &\leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} ds_{(28)} + \\ &\int_0^t \{ (a'_{28})^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} + \\ &(a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} + \\ &G_{28}^{(2)} |(a'_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a'_{28})^{(5)} (T_{29}^{(2)}, s_{(28)})| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} \} ds_{(28)} \end{aligned}$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\begin{aligned} |(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\widehat{M}_{28})^{(5)}t} &\leq \\ \frac{1}{(\widehat{M}_{28})^{(5)}} \{ (a_{28})^{(5)} + (a'_{28})^{(5)} + (\widehat{A}_{28})^{(5)} + (\widehat{P}_{28})^{(5)} (\widehat{k}_{28})^{(5)} \} &d \left(((G_{31})^{(1)}, (T_{31})^{(1)}); (G_{31})^{(2)}, (T_{31})^{(2)} \right) \end{aligned} \tag{357}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows

Remark 1: The fact that we supposed $(a'_{28})^{(5)}$ and $(b'_{28})^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ . 358

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(5)}$ and $(b''_i)^{(5)}$, $i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 359

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(5)} - (a''_i)^{(5)} (T_{29}(s_{(28)}), s_{(28)}) \} ds_{(28)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(5)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{28})^{(5)})_1, ((\widehat{M}_{28})^{(5)})_2$ and $((\widehat{M}_{28})^{(5)})_3 :$ 360

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$$G_{28} < (\widehat{M}_{28})^{(5)} \text{ it follows } \frac{dG_{29}}{dt} \leq ((\widehat{M}_{28})^{(5)})_1 - (a'_{29})^{(5)} G_{29} \text{ and by integrating}$$

$$G_{29} \leq ((\widehat{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29})^{(5)} ((\widehat{M}_{28})^{(5)})_1 / (a'_{29})^{(5)}$$

In the same way, one can obtain

$$G_{30} \leq ((\widehat{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30})^{(5)} ((\widehat{M}_{28})^{(5)})_2 / (a'_{30})^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28}, G_{30} and G_{28}, G_{29} respectively.

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below. 361

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(5)}((G_{31})(t), t)) = (b'_{29})^{(5)}$ then $T_{29} \rightarrow \infty$. 362

Definition of $(m)^{(5)}$ and $\varepsilon_5 :$

Indeed let t_5 be so that for $t > t_5$

$$(b_{29})^{(5)} - (b''_i)^{(5)}((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)}$$

Then $\frac{dT_{29}}{dt} \geq (a_{29})^{(5)}(m)^{(5)} - \varepsilon_5 T_{29}$ which leads to 363

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_5 t} = \frac{1}{2} \text{ it results}$$

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{2} \right), t = \log \frac{2}{\varepsilon_5} \text{ By taking now } \varepsilon_5 \text{ sufficiently small one sees that } T_{29} \text{ is unbounded. The same}$$

property holds for T_{30} if $\lim_{t \rightarrow \infty} (b''_{30})^{(5)}((G_{31})(t), t) = (b'_{30})^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions;

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$

364

It is now sufficient to take $\frac{(a_i)^{(6)}}{(\overline{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\overline{M}_{32})^{(6)}} < 1$ and to choose

365

$(\widehat{P}_{32})^{(6)}$ and $(\widehat{Q}_{32})^{(6)}$ large to have

$$\frac{(a_i)^{(6)}}{(\overline{M}_{32})^{(6)}} \left[(\widehat{P}_{32})^{(6)} + ((\widehat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{32})^{(6)} + G_j^0}{G_j^0}\right)} \right] \leq (\widehat{P}_{32})^{(6)}$$

366

$$\frac{(b_i)^{(6)}}{(\overline{M}_{32})^{(6)}} \left[((\widehat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{32})^{(6)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{32})^{(6)} \right] \leq (\widehat{Q}_{32})^{(6)}$$

367

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i into itself

368

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric

369

$$d\left(\left((G_{35})^{(1)}, (T_{35})^{(1)}\right), \left((G_{35})^{(2)}, (T_{35})^{(2)}\right)\right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\overline{M}_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\overline{M}_{32})^{(6)}t} \right\}$$

Indeed if we denote

$$\underline{\text{Definition of}} \left(\overline{(G_{35})}, \overline{(T_{35})}\right) : \left(\overline{(G_{35})}, \overline{(T_{35})}\right) = \mathcal{A}^{(6)}\left((G_{35}), (T_{35})\right)$$

It results

$$\begin{aligned} |\widetilde{G}_{32}^{(1)} - \widetilde{G}_i^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(\overline{M}_{32})^{(6)}s_{(32)}} e^{(\overline{M}_{32})^{(6)}s_{(32)}} ds_{(32)} + \\ &\int_0^t \{(a_{32}')^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\overline{M}_{32})^{(6)}s_{(32)}} e^{-(\overline{M}_{32})^{(6)}s_{(32)}} + \\ &(a_{32}'')^{(6)} (T_{33}^{(1)}, s_{(32)}) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\overline{M}_{32})^{(6)}s_{(32)}} e^{(\overline{M}_{32})^{(6)}s_{(32)}} + \\ &G_{32}^{(2)} |(a_{32}'')^{(6)} (T_{33}^{(1)}, s_{(32)}) - (a_{32}'')^{(6)} (T_{33}^{(2)}, s_{(32)})| e^{-(\overline{M}_{32})^{(6)}s_{(32)}} e^{(\overline{M}_{32})^{(6)}s_{(32)}}\} ds_{(32)} \end{aligned}$$

370

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|(G_{35})^{(1)} - (G_{35})^{(2)}| e^{-(\overline{M}_{32})^{(6)}t} \leq$$

371

$$\frac{1}{(\overline{M}_{32})^{(6)}} \left((a_{32})^{(6)} + (a_{32}')^{(6)} + (\widehat{A}_{32})^{(6)} + (\widehat{P}_{32})^{(6)} (\widehat{k}_{32})^{(6)} \right) d\left(\left((G_{35})^{(1)}, (T_{35})^{(1)}\right); (G_{35})^{(2)}, (T_{35})^{(2)}\right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a_{32}'')^{(6)}$ and $(b_{32}'')^{(6)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{32})^{(6)} e^{(\overline{M}_{32})^{(6)}t}$ and $(\widehat{Q}_{32})^{(6)} e^{(\overline{M}_{32})^{(6)}t}$ respectively of \mathbb{R}_+ .

372

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(6)}$ and $(b_i'')^{(6)}, i = 32, 33, 34$ depend only on T_{33} and respectively on (G_{35}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

373

From governing equations it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(6)} - (a_i'')^{(6)}(T_{33}(s_{(32)}), s_{(32)})\} ds_{(32)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(6)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{32})^{(6)})_1, ((\widehat{M}_{32})^{(6)})_2$ and $((\widehat{M}_{32})^{(6)})_3$:

374

Remark 3: if G_{32} is bounded, the same property have also G_{33} and G_{34} . indeed if

$$G_{32} < (\widehat{M}_{32})^{(6)} \text{ it follows } \frac{dG_{33}}{dt} \leq ((\widehat{M}_{32})^{(6)})_1 - (a_{33}')^{(6)} G_{33} \text{ and by integrating}$$

$$G_{33} \leq ((\widehat{M}_{32})^{(6)})_2 = G_{33}^0 + 2(a_{33})^{(6)} ((\widehat{M}_{32})^{(6)})_1 / (a_{33}')^{(6)}$$

In the same way, one can obtain

$$G_{34} \leq ((\widehat{M}_{32})^{(6)})_3 = G_{34}^0 + 2(a_{34})^{(6)} ((\widehat{M}_{32})^{(6)})_2 / (a_{34}')^{(6)}$$

If G_{33} or G_{34} is bounded, the same property follows for G_{32}, G_{34} and G_{32}, G_{33} respectively.

Remark 4: If G_{32} is bounded, from below, the same property holds for G_{33} and G_{34} . The proof is analogous with the preceding one. An analogous property is true if G_{33} is bounded from below.

375

Remark 5: If T_{32} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(6)}((G_{35})(t), t)) = (b_{33}')^{(6)}$ then $T_{33} \rightarrow \infty$.

376

Definition of $(m)^{(6)}$ and ε_6 :

Indeed let t_6 be so that for $t > t_6$

$$(b_{33})^{(6)} - (b_i'')^{(6)}((G_{35})(t), t) < \varepsilon_6, T_{32}(t) > (m)^{(6)}$$

Then $\frac{dT_{33}}{dt} \geq (a_{33})^{(6)}(m)^{(6)} - \varepsilon_6 T_{33}$ which leads to 377

$$T_{33} \geq \left(\frac{(a_{33})^{(6)}(m)^{(6)}}{\varepsilon_6} \right) (1 - e^{-\varepsilon_6 t}) + T_{33}^0 e^{-\varepsilon_6 t}$$

If we take t such that $e^{-\varepsilon_6 t} = \frac{1}{2}$ it results

$$T_{33} \geq \left(\frac{(a_{33})^{(6)}(m)^{(6)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_6}$$

By taking now ε_6 sufficiently small one sees that T_{33} is unbounded. The same

property holds for T_{34} if $\lim_{t \rightarrow \infty} (b_{34})''^{(6)}((G_{35})(t), t(t), t) = (b_{34}')^{(6)}$

We now state a more precise theorem about the behaviors at infinity of the solutions 378

Behavior of the solutions 379

Theorem 2: If we denote and define

Definition of $(\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)}$:

- (a) $(\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)}$ four constants satisfying
- $$-(\sigma_2)^{(1)} \leq -(a'_{13})^{(1)} + (a'_{14})^{(1)} - (a''_{13})^{(1)}(T_{14}, t) + (a''_{14})^{(1)}(T_{14}, t) \leq -(\sigma_1)^{(1)}$$
- $$-(\tau_2)^{(1)} \leq -(b'_{13})^{(1)} + (b'_{14})^{(1)} - (b''_{13})^{(1)}(G, t) - (b''_{14})^{(1)}(G, t) \leq -(\tau_1)^{(1)}$$

Definition of $(v_1)^{(1)}, (v_2)^{(1)}, (u_1)^{(1)}, (u_2)^{(1)}, v^{(1)}, u^{(1)}$:

- (b) By $(v_1)^{(1)} > 0, (v_2)^{(1)} < 0$ and respectively $(u_1)^{(1)} > 0, (u_2)^{(1)} < 0$ the roots of the equations
- $$(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0 \text{ and } (b_{14})^{(1)}(u^{(1)})^2 + (\tau_1)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$$

Definition of $(\bar{v}_1)^{(1)}, (\bar{v}_2)^{(1)}, (\bar{u}_1)^{(1)}, (\bar{u}_2)^{(1)}$:

- By $(\bar{v}_1)^{(1)} > 0, (\bar{v}_2)^{(1)} < 0$ and respectively $(\bar{u}_1)^{(1)} > 0, (\bar{u}_2)^{(1)} < 0$ the roots of the equations
- $$(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0 \text{ and } (b_{14})^{(1)}(u^{(1)})^2 + (\tau_2)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$$

Definition of $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}, (v_0)^{(1)}$:-

- (c) If we define $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}$ by
- $$(m_2)^{(1)} = (v_0)^{(1)}, (m_1)^{(1)} = (v_1)^{(1)}, \text{ if } (v_0)^{(1)} < (v_1)^{(1)}$$
- $$(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (\bar{v}_1)^{(1)}, \text{ if } (v_1)^{(1)} < (v_0)^{(1)} < (\bar{v}_1)^{(1)},$$

and $(v_0)^{(1)} = \frac{\sigma_{13}^0}{\sigma_{14}^0}$

$(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (v_0)^{(1)}, \text{ if } (\bar{v}_1)^{(1)} < (v_0)^{(1)}$

and analogously 383

$(\mu_2)^{(1)} = (u_0)^{(1)}, (\mu_1)^{(1)} = (u_1)^{(1)}, \text{ if } (u_0)^{(1)} < (u_1)^{(1)}$
 $(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (\bar{u}_1)^{(1)}, \text{ if } (u_1)^{(1)} < (u_0)^{(1)} < (\bar{u}_1)^{(1)},$

and $(u_0)^{(1)} = \frac{\tau_{13}^0}{\tau_{14}^0}$

$(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (u_0)^{(1)}, \text{ if } (\bar{u}_1)^{(1)} < (u_0)^{(1)}$ where $(u_1)^{(1)}, (\bar{u}_1)^{(1)}$ are defined above

Then the solution satisfies the inequalities 384

$$G_{13}^0 e^{((S_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{13}(t) \leq G_{13}^0 e^{(S_1)^{(1)}t}$$

where $(p_i)^{(1)}$ is defined above

$$\frac{1}{(m_1)^{(1)}} G_{13}^0 e^{((S_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{14}(t) \leq \frac{1}{(m_2)^{(1)}} G_{13}^0 e^{(S_1)^{(1)}t}$$

$$\left(\frac{(a_{15})^{(1)} G_{13}^0}{(m_1)^{(1)}((S_1)^{(1)} - (p_{13})^{(1)} - (S_2)^{(1)})} \left[e^{((S_1)^{(1)} - (p_{13})^{(1)})t} - e^{-(S_2)^{(1)}t} \right] + G_{15}^0 e^{-(S_2)^{(1)}t} \right) \leq G_{15}(t) \leq$$

$$\frac{(a_{15})^{(1)} G_{13}^0}{(m_2)^{(1)}((S_1)^{(1)} - (a'_{15})^{(1)})} \left[e^{(S_1)^{(1)}t} - e^{-(a'_{15})^{(1)}t} \right] + G_{15}^0 e^{-(a'_{15})^{(1)}t}$$

(k) By $(v_1)^{(6)} > 0, (v_2)^{(6)} < 0$ and respectively $(u_1)^{(6)} > 0, (u_2)^{(6)} < 0$ the roots of the equations

$$(a_{33})^{(6)} (v^{(6)})^2 + (\sigma_1)^{(6)} v^{(6)} - (a_{32})^{(6)} = 0$$

and $(b_{33})^{(6)} (u^{(6)})^2 + (\tau_1)^{(6)} u^{(6)} - (b_{32})^{(6)} = 0$ and 463

Definition of $(\bar{v}_1)^{(6)}, (\bar{v}_2)^{(6)}, (\bar{u}_1)^{(6)}, (\bar{u}_2)^{(6)}$: 464

By $(\bar{v}_1)^{(6)} > 0, (\bar{v}_2)^{(6)} < 0$ and respectively $(\bar{u}_1)^{(6)} > 0, (\bar{u}_2)^{(6)} < 0$ the

roots of the equations $(a_{33})^{(6)} (v^{(6)})^2 + (\sigma_2)^{(6)} v^{(6)} - (a_{32})^{(6)} = 0$

and $(b_{33})^{(6)} (u^{(6)})^2 + (\tau_2)^{(6)} u^{(6)} - (b_{32})^{(6)} = 0$

Definition of $(m_1)^{(6)}, (m_2)^{(6)}, (\mu_1)^{(6)}, (\mu_2)^{(6)}, (v_0)^{(6)}$:-

(l) If we define $(m_1)^{(6)}, (m_2)^{(6)}, (\mu_1)^{(6)}, (\mu_2)^{(6)}$ by

$$(m_2)^{(6)} = (v_0)^{(6)}, (m_1)^{(6)} = (v_1)^{(6)}, \text{ if } (v_0)^{(6)} < (v_1)^{(6)}$$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (\bar{v}_6)^{(6)}, \text{ if } (v_1)^{(6)} < (v_0)^{(6)} < (\bar{v}_1)^{(6)},$$

and $\boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}}$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (v_0)^{(6)}, \text{ if } (\bar{v}_1)^{(6)} < (v_0)^{(6)}$$

and analogously

465

$$(\mu_2)^{(6)} = (u_0)^{(6)}, (\mu_1)^{(6)} = (u_1)^{(6)}, \text{ if } (u_0)^{(6)} < (u_1)^{(6)}$$

$$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (\bar{u}_1)^{(6)}, \text{ if } (u_1)^{(6)} < (u_0)^{(6)} < (\bar{u}_1)^{(6)},$$

$$\text{and } (u_0)^{(6)} = \begin{matrix} T_{32}^0 \\ T_{33}^0 \end{matrix}$$

$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (u_0)^{(6)}, \text{ if } (\bar{u}_1)^{(6)} < (u_0)^{(6)}$ where $(u_1)^{(6)}, (\bar{u}_1)^{(6)}$ are defined respectively

Then the solution satisfies the inequalities

466

$$G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{32}(t) \leq G_{32}^0 e^{(S_1)^{(6)}t}$$

where $(p_i)^{(6)}$ is defined by equation above

$$\frac{1}{(m_1)^{(6)}} G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{33}(t) \leq \frac{1}{(m_2)^{(6)}} G_{32}^0 e^{(S_1)^{(6)}t} \quad 467$$

$$\left(\frac{(a_{34})^{(6)} G_{32}^0}{(m_1)^{(6)} ((S_1)^{(6)} - (p_{32})^{(6)} - (S_2)^{(6)})} \left[e^{((S_1)^{(6)} - (p_{32})^{(6)})t} - e^{-(S_2)^{(6)}t} \right] + G_{34}^0 e^{-(S_2)^{(6)}t} \right) \leq G_{34}(t) \leq (a_{34})^{(6)} G_{32}^0 (m_2)^{(6)} (S_1)^{(6)} - (a_{34}')^{(6)} 6e^{(S_1)^{(6)}t} - e^{-(a_{34}')^{(6)}t} + G_{34}^0 e^{-(a_{34}')^{(6)}t} \quad 468$$

$$T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t} \quad 469$$

$$\frac{1}{(\mu_1)^{(6)}} T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq \frac{1}{(\mu_2)^{(6)}} T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t} \quad 470$$

$$\frac{(b_{34})^{(6)} T_{32}^0}{(\mu_1)^{(6)} ((R_1)^{(6)} - (b_{34})^{(6)})} \left[e^{(R_1)^{(6)}t} - e^{-(b_{34}')^{(6)}t} \right] + T_{34}^0 e^{-(b_{34}')^{(6)}t} \leq T_{34}(t) \leq \quad 471$$

$$\frac{(a_{34})^{(6)} T_{32}^0}{(\mu_2)^{(6)} ((R_1)^{(6)} + (r_{32})^{(6)} + (R_2)^{(6)})} \left[e^{((R_1)^{(6)} + (r_{32})^{(6)})t} - e^{-(R_2)^{(6)}t} \right] + T_{34}^0 e^{-(R_2)^{(6)}t}$$

Definition of $(S_1)^{(6)}, (S_2)^{(6)}, (R_1)^{(6)}, (R_2)^{(6)}$:-

472

473

Where $(S_1)^{(6)} = (a_{32})^{(6)}(m_2)^{(6)} - (a'_{32})^{(6)}$

$$(S_2)^{(6)} = (a_{34})^{(6)} - (p_{34})^{(6)}$$

$$(R_1)^{(6)} = (b_{32})^{(6)}(\mu_2)^{(6)} - (b'_{32})^{(6)}$$

$$(R_2)^{(6)} = (b'_{34})^{(6)} - (r_{34})^{(6)}$$

474

475

Proof : From Governing equations we obtain

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t) \right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:-
$$v^{(1)} = \begin{matrix} G_{13} \\ G_{14} \end{matrix}$$

It follows

$$- \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} \right) \leq \frac{dv^{(1)}}{dt} \leq - \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

(a) For $0 < \begin{matrix} G_{13}^0 \\ G_{14}^0 \end{matrix} < (v_0)^{(1)} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \geq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}]t}}, \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}$$

it follows $(v_0)^{(1)} \leq v^{(1)}(t) \leq (v_1)^{(1)}$

In the same manner, we get

$$v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}, \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}$$

From which we deduce $(v_0)^{(1)} \leq v^{(1)}(t) \leq (\bar{v}_1)^{(1)}$

(b) If $0 < (v_1)^{(1)} < (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{v}_1)^{(1)}$ we find like in the previous case,

$$(v_1)^{(1)} \leq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_2)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_2)^{(1)}]t}} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}} \leq (\bar{v}_1)^{(1)}$$

(c) If $0 < (v_1)^{(1)} \leq (\bar{v}_1)^{(1)} \leq \frac{G_{13}^0}{G_{14}^0}$, we obtain

$$(v_1)^{(1)} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}} \leq (v_0)^{(1)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)} \leq v^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{v^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in concatenated equations of global system we get easily the result stated in the theorem.

Particular case :

If $(a_{13}^{(1)})'' = (a_{14}^{(1)})''$, then $(\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(v_1)^{(1)} = (\bar{v}_1)^{(1)}$ if in addition $(v_0)^{(1)} = (v_1)^{(1)}$ then $v^{(1)}(t) = (v_0)^{(1)}$ and as a consequence $G_{13}(t) = (v_0)^{(1)}G_{14}(t)$ this also defines $(v_0)^{(1)}$ for the special case Analogously if $(b_{13}^{(1)})'' = (b_{14}^{(1)})''$, then $(\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then $(u_1)^{(1)} = (\bar{u}_1)^{(1)}$ if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important consequence of the relation between $(v_1)^{(1)}$ and $(\bar{v}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

Proof : From the concatenated set of global governing equations we obtain

$$\frac{dv^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t) \right) - (a''_{17})^{(2)}(T_{17}, t)v^{(2)} - (a_{17})^{(2)}v^{(2)}$$

Definition of $v^{(2)}$:- $\boxed{v^{(2)} = \frac{G_{16}}{G_{17}}}$

It follows

$$- \left((a_{17})^{(2)}(v^{(2)})^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)} \right) \leq \frac{dv^{(2)}}{dt} \leq - \left((a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(2)}, (v_0)^{(2)}$:-

(d) For $0 < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (v_1)^{(2)} < (\bar{v}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_0)^{(2)}]t}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_0)^{(2)}]t}}, \quad \boxed{(C)^{(2)} = \frac{(v_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (v_2)^{(2)}}$$

it follows $(v_0)^{(2)} \leq v^{(2)}(t) \leq (v_1)^{(2)}$

In the same manner, we get

$$v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}, \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{v}_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (\bar{v}_2)^{(2)}}$$

From which we deduce $(v_0)^{(2)} \leq v^{(2)}(t) \leq (\bar{v}_1)^{(2)}$

(e) If $0 < (v_1)^{(2)} < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\bar{v}_1)^{(2)}$ we find like in the previous case,

$$\begin{aligned}
 (v_1)^{(2)} &\leq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_2)^{(2)}]t}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_2)^{(2)}]t}} \leq v^{(2)}(t) \leq \\
 &\frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}} \leq (\bar{v}_1)^{(2)}
 \end{aligned}$$

(f) If $0 < (v_1)^{(2)} \leq (\bar{v}_1)^{(2)} \leq (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0}$, we obtain 487

$$(v_1)^{(2)} \leq v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}} \leq (v_0)^{(2)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(2)}(t)$:- 488

$$(m_2)^{(2)} \leq v^{(2)}(t) \leq (m_1)^{(2)}, \quad \boxed{v^{(2)}(t) = \frac{G_{16}(t)}{G_{17}(t)}}$$

In a completely analogous way, we obtain 489

Definition of $u^{(2)}(t)$:-

$$(\mu_2)^{(2)} \leq u^{(2)}(t) \leq (\mu_1)^{(2)}, \quad \boxed{u^{(2)}(t) = \frac{T_{16}(t)}{T_{17}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem. 490

Particular case : 491

If $(a_{16}^{''})^{(2)} = (a_{17}^{''})^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)}G_{17}(t)$

Analogously if $(b_{16}^{''})^{(2)} = (b_{17}^{''})^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)}T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$ 492

Proof : From Global equations we obtain 493

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a_{20}')^{(3)} - (a_{21}')^{(3)} + (a_{20}'')^{(3)}(T_{21}, t) \right) - (a_{21}'')^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)}$$

Definition of $v^{(3)}$:- 494

$$\boxed{v^{(3)} = \frac{G_{20}}{G_{21}}}$$

It follows

$$- \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)} \right) \leq \frac{dv^{(3)}}{dt} \leq - \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)} \right)$$

From which one obtains 495

$$(a) \quad \text{For } 0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_0)^{(3)}]t}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_0)^{(3)}]t}}, \quad \boxed{(C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}}$$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$

In the same manner, we get 497

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}, \quad \boxed{(\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}}$$

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case, 498

$$\begin{aligned}
 (v_1)^{(3)} &\leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_2)^{(3)}]t}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}(v_1)^{(3)} - (v_2)^{(3)}]t}} \leq v^{(3)}(t) \leq \\
 &\frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}} \leq (\bar{v}_1)^{(3)}
 \end{aligned}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain 499

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}(\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)}]t}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}$$

Now, using this result and replacing it in Global Equations we get easily the result stated in the theorem.

Particular case :

If $(a_{20})^{(3)} = (a_{21})^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)}G_{21}(t)$

500

Analogously if $(b_{20})^{(3)} = (b_{21})^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$

Proof : From Global equations we obtain

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25}, t) \right) - (a''_{25})^{(4)}(T_{25}, t)v^{(4)} - (a_{25})^{(4)}v^{(4)}$$

Definition of $v^{(4)}$:-

$$v^{(4)} = \frac{G_{24}}{G_{25}}$$

It follows

$$- \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_2)^{(4)}v^{(4)} - (a_{24})^{(4)} \right) \leq \frac{dv^{(4)}}{dt} \leq - \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_4)^{(4)}v^{(4)} - (a_{24})^{(4)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \left(v_0 \right)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{- (a_{25})^{(4)}(v_1)^{(4)} - (v_0)^{(4)} t}}{4 + (C)^{(4)} e^{- (a_{25})^{(4)}(v_1)^{(4)} - (v_0)^{(4)} t}}, \quad (C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}}$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner , we get

501

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}}{4 + (\bar{C})^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}}, \quad (\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case,

502

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{- (a_{25})^{(4)}(v_1)^{(4)} - (v_2)^{(4)} t}}{1 + (C)^{(4)} e^{- (a_{25})^{(4)}(v_1)^{(4)} - (v_2)^{(4)} t}} \leq v^{(4)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}}{1 + (\bar{C})^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}} \leq (\bar{v}_1)^{(4)}$$

503

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \left(v_0 \right)^{(4)} = \frac{G_{24}^0}{G_{25}^0}$, we obtain

504

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}}{1 + (\bar{C})^{(4)} e^{- (a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)} t}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(4)}(t)$:-

505

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)}, \quad \boxed{v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t)$:-

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in Global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{24})^{(4)} = (a''_{25})^{(4)}$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case .**

Analogously if $(b''_{24})^{(4)} = (b''_{25})^{(4)}$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then $(u_1)^{(4)} = (\bar{u}_1)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

506

Proof : From concatenated set of equations we obtain

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)}$:- $\boxed{v^{(5)} = \frac{G_{28}}{G_{29}}}$

It follows

$$- \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)} \right) \leq \frac{dv^{(5)}}{dt} \leq - \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)}$:-

(g) For $0 < \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad \boxed{(C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner , we get

507

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{5 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}, \quad \boxed{(\bar{C})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_5)^{(5)}$

508

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case,

509

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}} \leq v^{(5)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (\bar{v}_1)^{(5)}$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}}$, we obtain

510

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (v_0)^{(5)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad \boxed{v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad \boxed{u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a_{28}^{''})^{(5)} = (a_{29}^{''})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)}G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case .**

Analogously if $(b_{28}^{''})^{(5)} = (b_{29}^{''})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then $(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)}T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$.**

511
512

Proof : From Global equations we obtain

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a'_{32})^{(6)} - (a'_{33})^{(6)} + (a''_{32})^{(6)}(T_{33}, t) \right) - (a''_{33})^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $\boxed{v^{(6)} = \frac{G_{32}}{G_{33}}}$

It follows

$$- \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_2)^{(6)}v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_1)^{(6)}v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

513

(j) For $0 < \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}, \quad \boxed{(C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner , we get

514

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}} , \quad \boxed{(\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case, 515

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (C)^{(6)} (v_2)^{(6)} e^{[-(a_{33})^{(6)} (v_1)^{(6)} - (v_2)^{(6)}] t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)} (v_1)^{(6)} - (v_2)^{(6)}] t}} \leq v^{(6)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}} \leq (\bar{v}_1)^{(6)}$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}}$, we obtain 516

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)} , \quad \boxed{v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)} , \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in global equations we get easily the result stated in the theorem.

Particular case :

If $(a''_{32})^{(6)} = (a''_{33})^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)} G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b''_{32})^{(6)} = (b''_{33})^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then

$(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)} T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

517
518
519

We can prove the following

Theorem 3: If $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ are independent on t , and the conditions

$$(a'_{13})^{(1)} (a'_{14})^{(1)} - (a_{13})^{(1)} (a_{14})^{(1)} < 0$$

$$(a'_{13})^{(1)} (a'_{14})^{(1)} - (a_{13})^{(1)} (a_{14})^{(1)} + (a_{13})^{(1)} (p_{13})^{(1)} + (a'_{14})^{(1)} (p_{14})^{(1)} + (p_{13})^{(1)} (p_{14})^{(1)} > 0$$

$$(b'_{13})^{(1)} (b'_{14})^{(1)} - (b_{13})^{(1)} (b_{14})^{(1)} > 0 ,$$

$$(b'_{13})^{(1)} (b'_{14})^{(1)} - (b_{13})^{(1)} (b_{14})^{(1)} - (b'_{13})^{(1)} (r_{14})^{(1)} - (b'_{14})^{(1)} (r_{14})^{(1)} + (r_{13})^{(1)} (r_{14})^{(1)} < 0$$

with $(p_{13})^{(1)}$, $(r_{14})^{(1)}$ as defined are satisfied , then the system

If $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ are independent on t , and the conditions

$$(a'_{16})^{(2)} (a'_{17})^{(2)} - (a_{16})^{(2)} (a_{17})^{(2)} < 0$$

$$(a'_{16})^{(2)} (a'_{17})^{(2)} - (a_{16})^{(2)} (a_{17})^{(2)} + (a_{16})^{(2)} (p_{16})^{(2)} + (a'_{17})^{(2)} (p_{17})^{(2)} + (p_{16})^{(2)} (p_{17})^{(2)} > 0$$

has a unique positive solution , which is an equilibrium solution for the system 571

Proof: 572

(a) Indeed the first two equations have a nontrivial solution G_{13}, G_{14} if 573

$$F(T) = (a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} + (a'_{13})^{(1)}(a''_{14})^{(1)}(T_{14}) + (a'_{14})^{(1)}(a''_{13})^{(1)}(T_{14}) + (a''_{13})^{(1)}(T_{14})(a''_{14})^{(1)}(T_{14}) = 0 \quad 574$$

(a) Indeed the first two equations have a nontrivial solution G_{16}, G_{17} if

$$F(T_{19}) = (a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} + (a'_{16})^{(2)}(a''_{17})^{(2)}(T_{17}) + (a'_{17})^{(2)}(a''_{16})^{(2)}(T_{17}) + (a''_{16})^{(2)}(T_{17})(a''_{17})^{(2)}(T_{17}) = 0 \quad 575$$

(a) Indeed the first two equations have a nontrivial solution G_{20}, G_{21} if

$$F(T_{23}) = (a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} + (a'_{20})^{(3)}(a''_{21})^{(3)}(T_{21}) + (a'_{21})^{(3)}(a''_{20})^{(3)}(T_{21}) + (a''_{20})^{(3)}(T_{21})(a''_{21})^{(3)}(T_{21}) = 0 \quad 576$$

(a) Indeed the first two equations have a nontrivial solution G_{24}, G_{25} if

$$F(T_{27}) = (a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} + (a'_{24})^{(4)}(a''_{25})^{(4)}(T_{25}) + (a'_{25})^{(4)}(a''_{24})^{(4)}(T_{25}) + (a''_{24})^{(4)}(T_{25})(a''_{25})^{(4)}(T_{25}) = 0$$

(a) Indeed the first two equations have a nontrivial solution G_{28}, G_{29} if
 $F(T_{31}) =$
 $(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} + (a'_{28})^{(5)}(a''_{29})^{(5)}(T_{29}) + (a'_{29})^{(5)}(a''_{28})^{(5)}(T_{29}) +$
 $(a''_{28})^{(5)}(T_{29})(a''_{29})^{(5)}(T_{29}) = 0$

(a) Indeed the first two equations have a nontrivial solution G_{32}, G_{33} if
 $F(T_{35}) =$
 $(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} + (a'_{32})^{(6)}(a''_{33})^{(6)}(T_{33}) + (a'_{33})^{(6)}(a''_{32})^{(6)}(T_{33}) +$
 $(a''_{32})^{(6)}(T_{33})(a''_{33})^{(6)}(T_{33}) = 0$

Definition and uniqueness of T_{14}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(1)}(T_{14})$ being increasing, it follows that there exists a unique T_{14}^* for which $f(T_{14}^*) = 0$. With this value, we obtain from the three first equations

$$G_{13} = \frac{(a_{13})^{(1)}G_{14}}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]} , \quad G_{15} = \frac{(a_{15})^{(1)}G_{14}}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

Definition and uniqueness of T_{17}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(2)}(T_{17})$ being increasing, it follows that there exists a unique T_{17}^* for which $f(T_{17}^*) = 0$. With this value, we obtain from the three first equations

$$G_{16} = \frac{(a_{16})^{(2)}G_{17}}{[(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17}^*)]} , \quad G_{18} = \frac{(a_{18})^{(2)}G_{17}}{[(a'_{18})^{(2)} + (a''_{18})^{(2)}(T_{17}^*)]}$$

Definition and uniqueness of T_{21}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(1)}(T_{21})$ being increasing, it follows that there exists a unique T_{21}^* for which $f(T_{21}^*) = 0$. With this value, we obtain from the three first equations

$$G_{20} = \frac{(a_{20})^{(3)}G_{21}}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]} , \quad G_{22} = \frac{(a_{22})^{(3)}G_{21}}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]}$$

Definition and uniqueness of T_{25}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(4)}(T_{25})$ being increasing, it follows that there exists a unique T_{25}^* for which $f(T_{25}^*) = 0$. With this value, we obtain from the three first equations

$$G_{24} = \frac{(a_{24})^{(4)}G_{25}}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]} , \quad G_{26} = \frac{(a_{26})^{(4)}G_{25}}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

Definition and uniqueness of T_{29}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(5)}(T_{29})$ being increasing, it follows that there exists a unique T_{29}^* for which $f(T_{29}^*) = 0$. With this value, we obtain from the three first equations

$$G_{28} = \frac{(a_{28})^{(5)}G_{29}}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]} , \quad G_{30} = \frac{(a_{30})^{(5)}G_{29}}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

Definition and uniqueness of T_{33}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(6)}(T_{33})$ being increasing, it follows that there exists a unique T_{33}^* for which $f(T_{33}^*) = 0$. With this value, we obtain from the three first equations

$$G_{32} = \frac{(a_{32})^{(6)}G_{33}}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]} , \quad G_{34} = \frac{(a_{34})^{(6)}G_{33}}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

(e) By the same argument, the equations of global system admit solutions G_{13}, G_{14} if

$$\varphi(G) = (b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} -$$

$$[(b'_{13})^{(1)}(b''_{14})^{(1)}(G) + (b'_{14})^{(1)}(b''_{13})^{(1)}(G)] + (b''_{13})^{(1)}(G)(b''_{14})^{(1)}(G) = 0$$

Where in $G(G_{13}, G_{14}, G_{15}), G_{13}, G_{15}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{14} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi(G^*) = 0$

(f) By the same argument, the equations 92,93 admit solutions G_{16}, G_{17} if

$$\varphi(G_{19}) = (b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} -$$

$$[(b'_{16})^{(2)}(b''_{17})^{(2)}(G_{19}) + (b'_{17})^{(2)}(b''_{16})^{(2)}(G_{19})] + (b''_{16})^{(2)}(G_{19})(b''_{17})^{(2)}(G_{19}) = 0$$

Where in $(G_{19})(G_{16}, G_{17}, G_{18}), G_{16}, G_{18}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{17} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi((G_{19})^*) = 0$

(g) By the same argument, the equations of the global system admit solutions G_{20}, G_{21} if

$$\varphi(G_{23}) = (b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} -$$

$$[(b'_{20})^{(3)}(b''_{21})^{(3)}(G_{23}) + (b'_{21})^{(3)}(b''_{20})^{(3)}(G_{23})] + (b''_{20})^{(3)}(G_{23})(b''_{21})^{(3)}(G_{23}) = 0$$

Where in $G_{23}(G_{20}, G_{21}, G_{22}), G_{20}, G_{22}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{21} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{21}^* such that $\varphi((G_{23})^*) = 0$

(h) By the same argument, the equations of the global system admit solutions G_{24}, G_{25} if 592

$$\varphi(G_{27}) = (b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - [(b'_{24})^{(4)}(b''_{25})^{(4)}(G_{27}) + (b'_{25})^{(4)}(b''_{24})^{(4)}(G_{27})] + (b''_{24})^{(4)}(G_{27})(b''_{25})^{(4)}(G_{27}) = 0$$

Where in $(G_{27})(G_{24}, G_{25}, G_{26}), G_{24}, G_{26}$ must be replaced by their values. It is easy to see that φ is a decreasing function in G_{25} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{25}^* such that $\varphi((G_{27})^*) = 0$

(i) By the same argument, the global equations admit solutions G_{28}, G_{29} if 593

$$\varphi(G_{31}) = (b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - [(b'_{28})^{(5)}(b''_{29})^{(5)}(G_{31}) + (b'_{29})^{(5)}(b''_{28})^{(5)}(G_{31})] + (b''_{28})^{(5)}(G_{31})(b''_{29})^{(5)}(G_{31}) = 0$$

Where in $(G_{31})(G_{28}, G_{29}, G_{30}), G_{28}, G_{30}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{29} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{29}^* such that $\varphi((G_{31})^*) = 0$

(j) By the same argument, the global equations admit solutions G_{32}, G_{33} if 594

$$\varphi(G_{35}) = (b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - [(b'_{32})^{(6)}(b''_{33})^{(6)}(G_{35}) + (b'_{33})^{(6)}(b''_{32})^{(6)}(G_{35})] + (b''_{32})^{(6)}(G_{35})(b''_{33})^{(6)}(G_{35}) = 0$$

Where in $(G_{35})(G_{32}, G_{33}, G_{34}), G_{32}, G_{34}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{33} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{33}^* such that $\varphi(G^*) = 0$

Finally we obtain the unique solution of the global system: 598

G_{14}^* given by $\varphi(G^*) = 0, T_{14}^*$ given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)}G_{14}^*}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]}, \quad G_{15}^* = \frac{(a_{15})^{(1)}G_{14}^*}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

$$T_{13}^* = \frac{(b_{13})^{(1)}T_{14}^*}{[(b'_{13})^{(1)} - (b''_{13})^{(1)}(G^*)]}, \quad T_{15}^* = \frac{(b_{15})^{(1)}T_{14}^*}{[(b'_{15})^{(1)} - (b''_{15})^{(1)}(G^*)]} \quad \text{599}$$

Obviously, these values represent an equilibrium solution 600

Finally we obtain the unique solution 601

G_{17}^* given by $\varphi((G_{19})^*) = 0, T_{17}^*$ given by $f(T_{17}^*) = 0$ and 602

$$G_{16}^* = \frac{(a_{16})^{(2)}G_{17}^*}{[(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17}^*)]}, \quad G_{18}^* = \frac{(a_{18})^{(2)}G_{17}^*}{[(a'_{18})^{(2)} + (a''_{18})^{(2)}(T_{17}^*)]} \quad \text{603}$$

$$T_{16}^* = \frac{(b_{16})^{(2)}T_{17}^*}{[(b'_{16})^{(2)} - (b''_{16})^{(2)}((G_{19})^*)]}, \quad T_{18}^* = \frac{(b_{18})^{(2)}T_{17}^*}{[(b'_{18})^{(2)} - (b''_{18})^{(2)}((G_{19})^*)]} \quad \text{604}$$

Obviously, these values represent an equilibrium solution 605

Finally we obtain the unique solution 606

G_{21}^* given by $\varphi((G_{23})^*) = 0, T_{21}^*$ given by $f(T_{21}^*) = 0$ and

$$G_{20}^* = \frac{(a_{20})^{(3)}G_{21}^*}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]}, \quad G_{22}^* = \frac{(a_{22})^{(3)}G_{21}^*}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]}$$

$$T_{20}^* = \frac{(b_{20})^{(3)}T_{21}^*}{[(b'_{20})^{(3)} - (b''_{20})^{(3)}(G_{23}^*)]}, \quad T_{22}^* = \frac{(b_{22})^{(3)}T_{21}^*}{[(b'_{22})^{(3)} - (b''_{22})^{(3)}(G_{23}^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution 607

G_{25}^* given by $\varphi(G_{27}) = 0, T_{25}^*$ given by $f(T_{25}^*) = 0$ and

$$G_{24}^* = \frac{(a_{24})^{(4)}G_{25}^*}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]}, \quad G_{26}^* = \frac{(a_{26})^{(4)}G_{25}^*}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

$$T_{24}^* = \frac{(b_{24})^{(4)}T_{25}^*}{[(b'_{24})^{(4)} - (b''_{24})^{(4)}((G_{27})^*)]}, \quad T_{26}^* = \frac{(b_{26})^{(4)}T_{25}^*}{[(b'_{26})^{(4)} - (b''_{26})^{(4)}((G_{27})^*)]} \quad \text{608}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution 609

G_{29}^* given by $\varphi((G_{31})^*) = 0, T_{29}^*$ given by $f(T_{29}^*) = 0$ and

$$G_{28}^* = \frac{(a_{28})^{(5)}G_{29}^*}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]}, \quad G_{30}^* = \frac{(a_{30})^{(5)}G_{29}^*}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

$$T_{28}^* = \frac{(b_{28})^{(5)}T_{29}^*}{[(b'_{28})^{(5)} - (b''_{28})^{(5)}((G_{31})^*)]}, \quad T_{30}^* = \frac{(b_{30})^{(5)}T_{29}^*}{[(b'_{30})^{(5)} - (b''_{30})^{(5)}((G_{31})^*)]} \quad \text{610}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution 611

G_{33}^* given by $\varphi((G_{35})^*) = 0, T_{33}^*$ given by $f(T_{33}^*) = 0$ and

$$G_{32}^* = \frac{(a_{32})^{(6)}G_{33}^*}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]}, \quad G_{34}^* = \frac{(a_{34})^{(6)}G_{33}^*}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

$$T_{32}^* = \frac{(b_{32})^{(6)}T_{33}^*}{[(b_{32})^{(6)} - (b_{32})^{(6)}((G_{35})^*)]} , T_{34}^* = \frac{(b_{34})^{(6)}T_{33}^*}{[(b_{34})^{(6)} - (b_{34})^{(6)}((G_{35})^*)]} \quad 612$$

Obviously, these values represent an equilibrium solution

ASYMPTOTIC STABILITY ANALYSIS 613

Theorem 4: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ Belong to $C^{(1)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + G_i , T_i = T_i^* + T_i$$

$$\frac{\partial (a_{14}'')^{(1)}}{\partial T_{14}}(T_{14}^*) = (q_{14})^{(1)} , \frac{\partial (b_i'')^{(1)}}{\partial G_j}(G^*) = s_{ij}$$

Then taking into account equations of global system neglecting the terms of power 2, we obtain

$$\frac{dG_{13}}{dt} = -((a_{13}')^{(1)} + (p_{13})^{(1)})G_{13} + (a_{13})^{(1)}G_{14} - (q_{13})^{(1)}G_{13}^*T_{14} \quad 614$$

$$\frac{dG_{14}}{dt} = -((a_{14}')^{(1)} + (p_{14})^{(1)})G_{14} + (a_{14})^{(1)}G_{13} - (q_{14})^{(1)}G_{14}^*T_{14} \quad 615$$

 \end{aligned}$$

And as one sees, all the coefficients are positive. It follows that all the roots have negative real part, and this proves the theorem.

Acknowledgments:

The introduction is a collection of information from various articles, Books, News Paper reports, Home Pages Of authors, Journal Reviews, the internet including Wikipedia. We acknowledge all authors who have contributed to the same. In the eventuality of the fact that there has been any act of omission on the part of the authors, We regret with great deal of compunction, contrition, and remorse. As Newton said, it is only because erudite and eminent people allowed one to piggy ride on their backs; probably an attempt has been made to look slightly further. Once again, it is stated that the references are only illustrative and not comprehensive

Shape Recognition Based On Features Matching Using Morphological Operations

Shikha Garg¹, Gianetan Singh Sekhon²

¹(Student, M.Tech Department of Computer Engineering, YCOE, Punjabi University, Patiala, India)

²(Assistant Professor, M.Tech Department of Computer Engineering, YCOE, Punjabi University, Patiala, India)

Abstract: This paper presents the implementation of method of shape recognition among different regular geometrical shapes using morphological operations. Many algorithms have been proposed for this problem but the major issue that has been enlightened in this paper is over segmentation dodging among different objects. After an introduction to shape recognition concept, we describe the process of extracting the boundaries of objects in order to avoid over segmentation. Then, a shape recognition approach is proposed. It is based on some mathematical formulae. Our new algorithm detects the shapes in the following cases when (i) There are distinct objects in the given image. (ii) The objects are touching in the given image. (iii) The objects are overlapping in the given image. (iv) One object is contained in the other in the given image. Then with the help of boundaries concentrate and shape properties, classification of the shapes is done.

Keywords: Edge detection, geometrical shapes, morphological operations, over segmentation, Shape recognition.

I. Introduction

In an image, shape plays a significant role. Shape of an image is one of the key information when an eye recognizes an object. Shape of an image does not change when colour of image is changed. Shape recognition finds its applications in robotics, fingerprint analysis, handwriting mapping, face recognition, remote sensors etc [6]. In pattern recognition shape is one of the significant research areas. Main focus of the pattern recognition is the classification between objects.

In a computer system, shape of an object can be interpreted as a region encircled by an outline of the object. The important job in shape recognition is to find and represent the exact shape information. Many algorithms for shape representation have been proposed so far.

Many methods for 2D shape representation and recognition have been reported. Curvature scale space (CSS), dynamic programming, shape context, Fourier descriptor, and wavelet descriptor are as the example of these approaches [8]. There are two methods for shape recognition, area based and boundary based technique. In area based technique, all pixels within the region of image are taken into consideration to get shape representation. Common area based technique uses moment descriptors to depict the shape. Whereas boundary based technique focuses mainly on object boundary. Boundary based technique represents shape feature of object more clearly as compared to area based technique. It is fast in processing and needs less computation than area based technique. Due to fast processing and easy computation it is widely used in

real time and practical applications. In this paper we consider just the boundary based technique.

In the previous work of shape recognition, object detection approaches based on color/texture segmentation or image binarization and foreground extraction is proposed, which can be used in this case. Other shape detection solutions are based on edge-detection, sliding-windows or generalized Hough transforms. The identified image objects are then recognized by their shapes. The focus of this paper is shape recognition by edge detection using morphological operations. In this paper the problem of over segmentation among different objects has been taken into consideration for shape recognition. The different objects in the given image are processed one by one and then they are clustered together to form the output image. This process is executed in two stages: firstly, the image is read in from the user and objects which are touching one another are segmented. Then we will match the features of the current object with the preloaded features in the database or we can say training set for recognition.

II. Materials and methods

The computation of proposed method can be briefly summarised in 2 steps (1) Avoidance of over segmentation among different objects like circle, rectangle, square etc with the use of morphological operations (2) Labelling the objects after recognition of various objects within the image.

2.1 Over segmentation avoidance

The proposed method is trying to prevent the over segmentation and segment some overlapping areas to extract the boundaries of various objects within the image. For this, read the RGB image in from the user and convert the RGB (coloured) image to gray scale and then to binary image. Invert the binary image in order to speed up the time of processing. Then morphological operation is implemented so that all the objects are eroded from all the sides and then the boundaries of small radius are enhanced along the edges of the objects.

```
se = strel('disk', 1);  
dummy1=imerode(dummy,se);
```

SE = strel('disk', R,) creates a flat, disk-shaped structuring element, where R specifies the radius. R must be a nonnegative integer. Here the value of R is 1. Imerode performs binary erosion; otherwise it performs gray scale erosion. If SE is an array of structuring element objects, imerode performs multiple erosions of the input image, using each structuring element in SE in succession.

2.2 Recognition and labelling of objects

In this algorithm when the objects are being segmented from each other, the final stage is to identify the shape of the objects. This is done by using filtering technique. Some properties like centroid and corners of the objects are needed to predict the shapes of varying objects. Then with these mathematical parameters, objects of input image are matched with the preloaded features of the objects in the database or we can say training set and thus we can recognize the shape of the objects.

CIRCLE > Number of corners = 0 > Absolute difference b/w length and breadth < 25 > Sensitivity Factor = 0.24	TRIANGLE > Number of corners = 3 > Sensitivity Factor = 0.24	SQUARE > Number of corners = 4 > Absolute difference b/w length and breadth < 10 > Sensitivity Factor = 0.24
--	---	--

RECTANGLE > Number of corners = 4 > Absolute difference b/w length and breadth > 10 > Sensitivity Factor = 0.24	POLYGON > Number of corners = 4 > Absolute difference b/w length and breadth < 10 > Sensitivity Factor = 0.2
---	--

Table.1 filters used to distinguish objects

III. Experiments

We have performed numerous experiments using the described shape recognition approach. The proposed technique has been tested on various image datasets and satisfactory results have been obtained. A high recognition rate, of approximately 95 %, is achieved by our method. It represents a better rate than those of many other object recognition approaches.

An indexed image consists of an array and a colormap matrix. The pixel values in the array are direct indices into a colormap. An indexed image uses direct mapping of pixel values to colormap values. The color of each image pixel is determined by using the corresponding value of X as an index. As RGB image is having an index value of 255 therefore we set this parameter to a scalar between 250 and 0 and in loop this scalar value go on decrementing with a value 5. As this scalar value matches with the index value of object, the particular object is identified. The image is then converted in the binary form, then the binary image is processed using some morphological operations, to eliminate the over segmented area and retain only the important image regions.

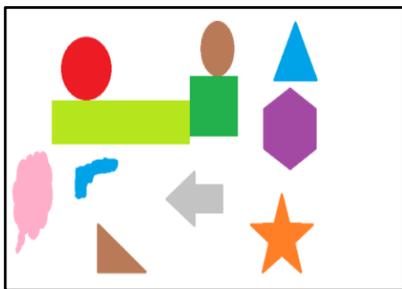

Fig.1 Image containing several objects

A shape recognition example is described in the next figures. Thus, in Fig.2 there is a displayed image containing objects which are segmented. Each object is marked with the obj_i value in the picture, $i = 2 \dots, 12$.

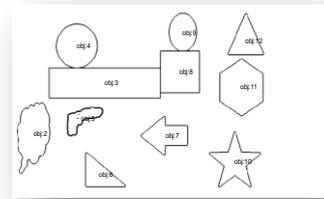

Fig.2 segmented objects

The connected components of the enhanced binary image are detected, thus the image foreground, containing the main objects, being extracted. The feature extraction process is then applied on the detected shapes. The obtained shapes are then classified using the presented shape recognition algorithm. The shape names corresponding to the image from Fig. 1 are represented in Fig. 3. As one can see in that figure, each object is labelled with the name matched with its features. The final recognition results are, circle {obj4,obj6}, square {obj8}, rectangle {obj3}, triangle {obj5,obj12}, polygon {obj11}.

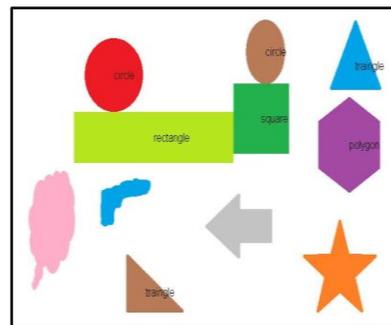

Fig.3 The resulted labelled objects

IV. Conclusion

In this study, a new method of shape recognition is proposed which takes into account the problem of over segmentation. By integrating the structural features like distance measure and centroid, the proposed method extracts the structural information of shapes. Based on those properties, various shapes can be recognized. The identification of the appropriate name of shape clusters automatizes the classification method, which represents a very important thing. That means our recognition technique can be used successfully for very large sets of images, containing a high number of shapes.

Experiments have shown that this method produces accurate and fast results with different images provided. The results of this provided recognition technique can be applied successfully in important domains, such as object recognition and segmentation.

ABSTRACT: This paper describes design and analysis of laminated composite mono leaf spring. Weight reduction is now the main issue in automobile industries. In the present work, the dimensions of an existing mono steel leaf spring of a Maruti 800 passenger vehicle is taken for modeling and analysis of a laminated composite mono leaf spring with three different composite materials namely, E-glass/Epoxy, S-glass/Epoxy and Carbon/Epoxy subjected to the same load as that of a steel spring. The design constraints were stresses and deflections. The three different composite mono leaf springs have been modeled by considering uniform cross-section, with unidirectional fiber orientation angle for each lamina of a laminate. Static analysis of a 3-D model has been performed using ANSYS 10.0. Compared to mono steel leaf spring the laminated composite mono leaf spring is found to have 47% lesser stresses, 25%~65% higher stiffness, 27%~67% higher frequency and weight reduction of 73%~80% is achieved.

Keywords: Laminated Composite leaf spring (LCLS), Static analysis, E- Glass/Epoxy, S-glass/Epoxy, Carbon/Epoxy,

I. INTRODUCTION

In order to conserve natural resources and economize energy, weight reduction has been the main focus of automobile manufacturers in the present scenario.

Weight reduction can be achieved primarily by the introduction of better material, design optimization and better manufacturing processes. The suspension leaf spring is one of the potential items for weight reduction in automobiles as it accounts for 10% - 20% of the unstrung weight. This achieves the vehicle with more fuel efficiency and improved riding qualities. The introduction of composite materials was made it possible to reduce the weight of the leaf spring without any reduction on load carrying capacity and stiffness.

Since, the composite materials have more elastic strain energy storage capacity and high strength to weight ratio as compared with those of steel, multi- leaf steel springs are being replaced by mono- leaf composite laminated springs. The composite material offer opportunities for substantial weight saving but not always are cost-effective over their steel counter parts. The leaf spring should absorb the vertical vibrations and impacts due to road irregularities by means of vibrations in the spring deflection so that the potential energy is stored in spring as strain energy and then released slowly. So,

increasing the energy storage capability of a leaf spring ensures a more compliant suspension system. According to the studies made a material with maximum strength and minimum modulus of elasticity in the longitudinal direction is the most suitable material for a leaf spring. Fortunately, composites have these characteristics. In the present work, an attempt is made to replace the existing mono steel leaf spring used in maruti 800 passenger car with a laminated composite mono steel leaf spring made of three different composite materials viz., E-glass/epoxy, S-glass/epoxy and Carbon/epoxy composites. Dimensions and the number of leaves for both steel leaf spring and laminated composite leaf springs are considered to be the same.

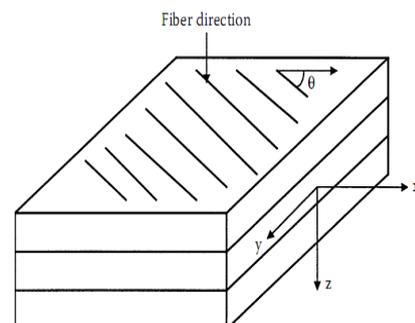

Fig. No.1 Schematic diagram of a laminate.

II. LITERATURE REVIEW

The review mainly focuses on replacement of steel leaf spring with the composite leaf spring made of glass fibre reinforced polymer (GFRP) and majority of the published work applies to them.

Mouleswaran et al. [1] describes static and fatigue analysis of steel leaf spring and composite multi leaf spring made up of glass fibre reinforced polymer using life datanalysis. The dimensions of an existing conventional steel leaf spring of a light commercial vehicle are taken and are verified by design calculations. Static analysis of 2-D model of conventional leaf spring is also performed using ANSYS 7.1 and compared with experimental results.

Al-Qureshi et al. [2] has described a single leaf, variable thickness spring of glass fiber reinforced plastic (GFRP) with similar mechanical and geometrical properties to the multi leaf spring, was designed, fabricated and tested.

Rajendran I, et al.[3] investigated the formulation and solution technique using genetic algorithms (GA) for

design optimization of composite leaf springs. Gulur Siddaramanna et al. [4] explain the automobile industry has shown interest in the replacement of steel spring with fibreglass composite leaf spring due to high strength to weight ratio.

Peiyong et al. [5] describes that the leaf spring design was mainly based on simplified equations and trail and error methods. The simplified equation models were limited to the three-link mechanism assumption and linear beam method. This work presents detailed finite element modeling and analysis of a two stage multi leaf spring, a leaf spring assembly, and a Hotchkiss suspension using ABAQUS.

III. SPECIFICATION OF THE PROBLEM

The objective of the present work is to design and analyses, of mono steel leaf spring and also laminated composite leaf spring made of three different composite materials viz., E-glass/epoxy, S-glass/ epoxy and Carbon/epoxy composites. Laminated composite leaf of four layers with uni-directional fiber orientation angle i.e., 0° is considered. A virtual model of both steel and laminated mono composite leaf spring was created in Pro-E. Model is imported in ANSYS 10.0 for analysis by applying normal load conditions. After analysis a comparison is made between existing conventional steel leaf spring and laminated mono composite leaf spring viz., e-glass/epoxy, s-glass/epoxy, carbon/epoxy in terms of deflections and stresses, to choose the best one.

IV. LEAF SPRINGS

Leaf springs also known as flat spring are made up of flat plates. Leaf springs are designed in two ways: 1. Multi leaf 2. Mono leaf. The importance of leaf spring is to carry bump loads (i.e due to road irregularities), brake torque, driving torque, etc... in addition to shocks.

The multi-leaf spring is made up of several steel plates of different length stacked together, while mono-leaf spring is made up of single steel plate. During normal operation, the spring compresses to absorb road shock. The leaf spring bend and slide on each other allowing suspension movement.

IV.I Materials for Leaf springs :

The material used for leaf springs is usually a plain carbon steel having 0.90 to 1.0% carbon. The leaves are heat treated after the forming process. After the heat treatment process spring steel products gets greater strength and therefore greater load capacity, greater range of deflection and better fatigue properties.

IV.II Theoretical calculations of conventional steel leaf spring:

In the present analysis the maximum deflection of the mono leaf spring is limited to 34mm, then the allowable load on the spring is given by

Deflection

$$\delta = \frac{12 \cdot W \cdot L^3}{E \cdot b \cdot t^3 \cdot (2n_G + 3n_F)}$$

$$34 = \frac{12 \cdot W \cdot L^3}{E \cdot b \cdot t^3 \cdot (2n_G + 3n_F)}$$

$$W = 794.5N$$

Stress

$$\sigma = \frac{6 \cdot W \cdot L}{n \cdot b \cdot t^2}$$

$$= \frac{6 \cdot 794.5 \cdot 482.5}{1 \cdot 50 \cdot 10^2}$$

$$= 460.038Mpa.$$

V. COMPOSITE MATERIALS:

A composite material is defined as a material composed of two or more constituents combined on a macroscopic scale by mechanical and chemical bonds.

Composites are combinations of two materials in which one of the material is called the “matrix phase” is in the form of fibers, sheets, or particles and is embedded in the other material called the “reinforcing phase”.

Many composite materials offer a combination of strength and modulus that are either comparable to or better than any traditional metallic metals. Because of their low specific gravities, the strength to weight-ratio and modulus to weight-ratios of these composite materials are markedly superior to those of mettalic materials.

The fatigue strength weight ratios as well as fatigue damage tolerances of many composite laminates are excellent. For these reasons, fiber composite have emerged as a major class of structural material and are either used or being considered as substitutions for metal in many weight-critical components in aerospace, automotive and other industries.

Another unique characteristic of many fiber reinforced composites is their high interal damping capacity. This leads to better vibration energy absorption within the material and results in reduced transmission of noise to neighboring structures.

High damping capacity of composite materials can be beneficial in many automotive applications in which noise, vibration, and hardness is a critical issue for passenger comfort.

VI. SPECIFICATION OF EXISTING LEAF SPRING:

Table 1 shows the specifications of a mono leaf steel spring of a maruti 800 passenger vehicle. The typical chemical composition of the material is 0.565C, 1.8% Si, 0.7% Mn, 0.045%P and 0.045% S.

Table: 1 Specifications of Mono leaf steel spring

S.No	Parameters	Value
1.	Total length of the spring(Eye to Eye)	965 mm
2.	Free camber (At no load condition)	68 mm
3.	No.of full length leave (Master Leaf)	01
4.	Thickness of leaf	10 mm
5.	Width of leaf spring	50 mm
6.	Maximum load given on spring	794.54 N
7.	Young's Modulus of leaf spring	2.1e5 N/mm ²

VII. FINITE ELEMENT ANALYSIS OF LAMINATED COMPOSITE LEAF SPRING

Dimensions of Laminated composite leaf spring (LCLS) are taken as that of the conventional steel leaf spring (SLS). Laminated composite leaf spring (LCLS) is assumed to have 4 lamina of 0° degree fiber orientation angle (thickness of each lamina of 2.5mm). Width of the leaf is 50mm. Since the properties of LCLS vary with directions of fiber, a 3-D model of leaf spring is used for analysis in ANSYS 10.0. The loading conditions are assumed to be static. The element chosen for the analysis is SHELL 99, which is a layered version of the 8-node structural shell model. The element has six degrees of freedom at each node : translations in the nodal x, y, and z directions and rotations about the nodal x, y, and z-axes. The element allows up to 250 layers. The finite element analysis is carried out on mono steel leaf spring as well as on three different types of laminated composite mono leaf spring. From the analysis the equivalent stress (Von-mises stress) and displacements were determined and are shown in figure 1-9. Table 2 shows the comparative analysis of mono leaf steel spring and laminated composite mono leaf spring of three different materials. Figure 10-11 shows the variation of deflections and stresses induced in steel spring and laminated composite leaf spring with respect to the variation of load.

Fig. No. 11- Load - Von-Mises stress for Steel and Laminated Composite leaf spring

VIII. CONCLUSIONS

A comparative study has been made between laminated composite leaf spring and steel leaf spring with respect to weight, stiffness and strength.

By employing a composite leaf spring for the same load carrying capacity, there is a reduction in weight of 73%~80%, natural frequency of composite leaf springs are 27%~67% higher than steel leaf spring and 23~65% stiffer than the steel spring.

Based on the results, it was inferred that carbon/epoxy laminated composite mono leaf spring has superior strength and stiffness and lesser in weight compared to steel and other composite materials considered in this investigation.

From the results, it is observed that the laminated composite leaf spring is lighter and more economical than the conventional steel spring with similar design specifications.

³HOD, Mechanical Department SBSCET, Ferozepur

Abstract: This paper is concerned with the investigation of the capability of Detonation sprayed Ni-Cr And Al₂O₃ 13TiO₂ coatings to improve the tribological and mechanical properties of grey cast iron. The present study describes and compares the mechanical and tribological properties of NiCr and Al₂O₃ 13TiO₂ D-Sprayed coatings deposited on two different substrates (GI250 and GIHC). Experiments using a tribometer (pin on disc) is performed in order to evaluate the wear properties. The coating microstructures were characterised by SEM and EDAX. Cumulative weight analysis is done to compare the wear loss in weight and its concluded Al₂O₃ 13TiO₂ form a good bond with GI250 using Detonation spray process.

Keywords: Al₂O₃ 13TiO₂, Detonation, EDAX, Ni-Cr, SEM.

I. Introduction

Surface engineering is an economic method for the production of materials, tools and machine parts with required surface properties, such as wear and corrosion resistance [1]. Since many types of attack such as corrosion, friction, wear, heat, radiation occur on the surface of a component, or transferred via the surface into the component, surface protection is of a considerable significance as regards modern materials technology.

The purpose of surface technology including thermal spraying is to produce functionally effective surfaces [2]. The wear resistance in the case of brake disc rotors, wire drawing pulleys etc. can be improved by a wide range of coatings.

Thermal spray is a technique that produces a wide range of coatings for diverse applications. The principle of thermal spray is to melt material feedstock (wire or powder), to accelerate the melt to impact on a substrate where rapid solidification and deposit build-up occurs[3].

To reduce the wear problem, wear resistant coatings are deposited on the grey irons. Standard test methods for wear testing with pin-on disc apparatus are employed to study the wear behavior of the uncoated and coated grey irons as well. Thermal spray processes that have been considered to deposit the coatings are enlisted as: (1) Flame spraying with a powder or wire, (2) Electric arc wire spraying, (3) Plasma spraying, (4) Spray and fuse, (5) High Velocity Oxyfuel (HVOF) spraying, (6) Detonation Gun.

Among the commercially available thermal spray coating techniques, detonation spray (DS) is chosen to get hard, dense and consequently wear resistant coatings

II. Experimental Procedure

Two types of gray irons were studied: one Grade 250 (GI250), one high-carbon (GIHC), whose chemical compositions and basic mechanical properties are shown in Table 1.

Table 1
Chemical composition (wt.%) and mechanical properties of irons

	GI250	GIHC
C	3.54	3.73
Si	2.15	2.07
Mn	0.51	0.78
P	0.054	0.058
S	0.1	0.085
Ti	0.012	0.014
Cu	0.69	0.56
Cr	0.034	0.27
Sn	0.061	0.039
Hardness(HB)	195 ± 5	180 ± 5

Samples of cylindrical shape, with diameter 8mm and length 30mm were casted with the components of GI250 and GIHC. The casted samples were marked accordingly with sample numbers and The grinding of end faces (to be coated) of the pins is done using emery papers of five different grades 220, 400, 600, 800, 1000 in the same order. Grinding was followed by polishing with 1/0, 2/0, 3/0 and 4/0 grades polishing papers. Two types of coating powders namely (1)Ni-Cr (2) Al₂O₃-13TiO₂ are selected for Detonation Spray Coating Process after the literature survey. Powder Ni-Cr and Al₂O₃-13TiO₂ form hard dense and excellent bonded coatings on the samples. The wear tests were performed in a machine (Wear and Friction Monitor Tester TR-201) conforming to ASTM G 99 standard. The wear tests for coated as well as uncoated specimens were conducted under three normal loads of 30 N, 40 N and 50 N and a fixed sliding velocity of 1 m/s. A track diameter of D=40 mm, sliding speed v=1 m/s is kept. Wear tests have been carried out for a total sliding distance of 5400 m (6 cycles of 5min, 5min, 10min, 10min, 20min, 40min duration),so that only top coated surface was exposed for each detonation sprayed sample. Weight losses for pins were measured after each cycle to determine the wear loss.

The weight was measured by a micro balance to an accuracy of 0.0001 gm. The coefficient of friction has been determined from the friction force and the normal loads in all

the cases. The wear tracks produced in the coating were studied by SEM (FEI Quanta 200F), and The EDAX genesis software indicates the elemental compositions (weight %) present at point/area of interest. The results of coating volume loss are reported.

III. Results and Discussion

Cumulative weight loss for samples are compared in Figure 1 and The FE-SEM micrograph for Detonation sprayed Ni-Cr and Al₂O₃-13TiO₂ coatings on GI250 and GIHC along with micrograph for uncoated sample are shown in Figure 2.

Cumulative weight loss figure shows the loss in weight for each sample after a cycle of 5400m at a load of 40N. From the table it is clear that weight loss in case of coated samples is very less as compared to uncoated samples. In case of first and second sample (Ni-Cr coating on GIHC) and (Ni-Cr coating on GI250) if we compare it is found that weight loss in case of first sample is higher than the later, this means Ni-Cr coating is more

compatible with GI250 but coated GI250 and GIHC sample as compared to uncoated samples clearly illustrates that wear is negligible. In case of third and fourth sample (Al₂O₃ 13TiO₂ coating on GIHC) and (Al₂O₃ 13TiO₂ coating on GI250) it is predicted that Al₂O₃ 13TiO₂ is good wear resistant as it shows negligible wear as compared to uncoated GI250 and GIHC samples.

And if uncoated samples are compared it is found that GI250 is more wear resistant than GIHC mainly due to its higher hardness than GIHC

The FE-SEM micrographs in general indicate that the coatings are uniform, homogeneous and free from surface cracks. The Al₂O₃-13TiO₂ coatings have small size splats whereas the splats are coarse for Ni-Cr coating. More surface roughness is visible on micrographs of uncoated samples of GI250 and GIHC.

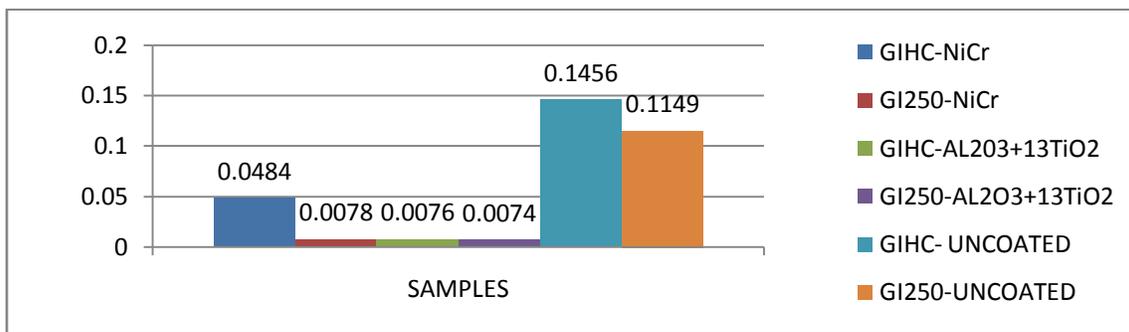

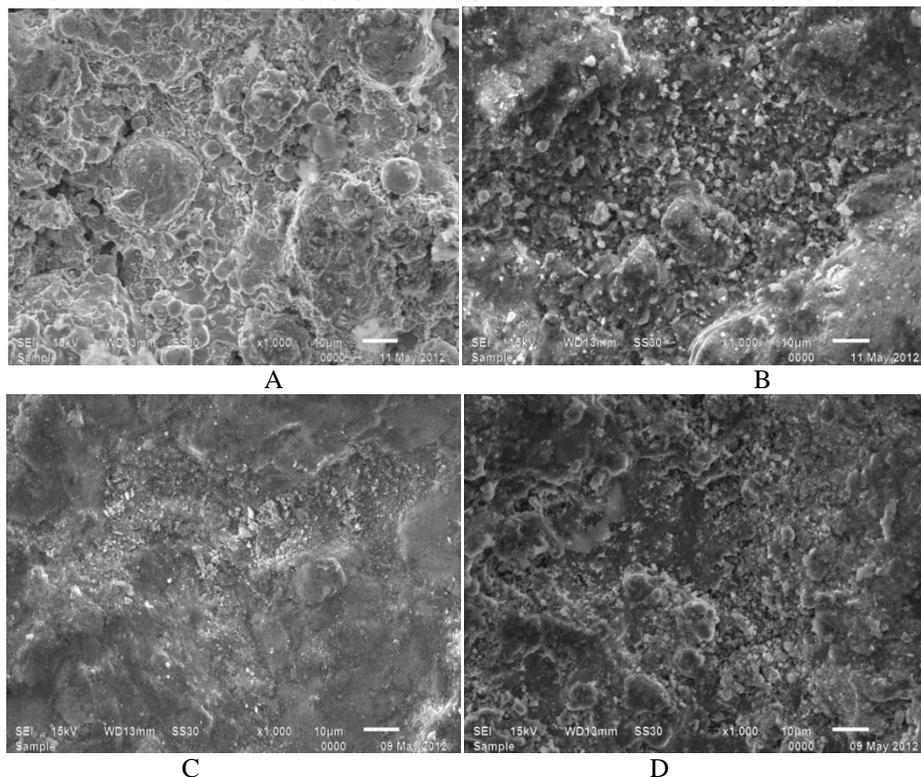

Figure 1: CUMMULATIVE WEIGHT LOSS OF EACH SAMPLE AFTER CYCLE OF 5400M AT 40 N LOADS.

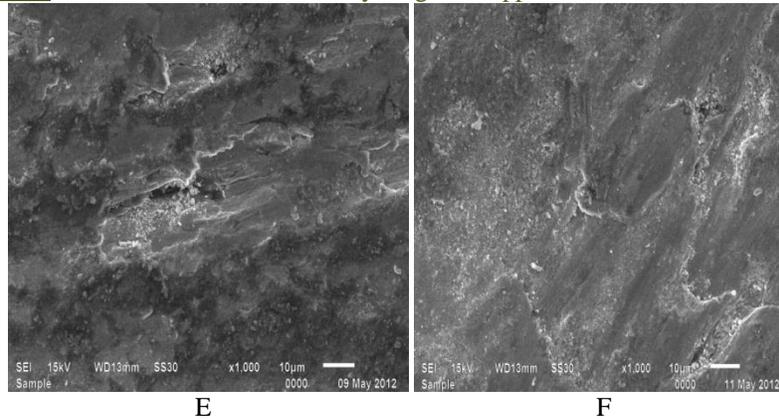

Fig. 2.: SEM Micrographs Of Worn Out Samples Of (A) Ni-Cr Coating On GIHC (B) $Al_2O_3+13TiO_2$ Coating On GIHC (C) Ni-Cr Coating On GI250 (D) $Al_2O_3+13TiO_2$ Coating On GI250 (E) Uncoated GIHC Sample (F) Uncoated GI250 Sample At 40N Load

As reported by Astakhov, (2008) [4] that it is possible to deposit almost any material on any substrate without change in the properties of base material by D-gun spray process to considerably extend the life of parts, it is observed in the present study that the NiCr, $Al_2O_3-13TiO_2$ coatings powders have been successfully deposited on GI250 and GIHC substrates by the detonation spray process. It was further confirmed by characterization of coatings using EDAX analysis of as coated specimens. obtained in the study have been supported by the findings of Mohanty et al., (1996)[5]; Sahraoui et al., (2003)[6] and Bolelli et al.,(2006). [7]

The detonation sprayed NiCr, $Al_2O_3-13TiO_2$ coated GI250 and GIHC specimens showed significantly lower cumulative weight loss (Figure 1) as compared to bare GI250 and GIHC materials under the normal load of 40N. It was investigated with the help of Pin-on-Disk Wear Test Rig according to ASTM G99-03 Standard. There are many studies ; Murthy & Venkataraman (2006)[8], Sundarajan et al.(2005)[9] which support the above finding that Detonation sprayed coatings reduces the wear loss.

IV. Conclusion

- Detonation Sprayed NiCr, $Al_2O_3-13TiO_2$ coatings have successfully been deposited on GI250 and GIHC grades of grey cast iron.
- The detonation sprayed NiCr, $Al_2O_3-13TiO_2$ coated GI250 and GIHC specimens showed significantly lower cumulative weight loss as compared to uncoated GI250 and GIHC materials.
- Cumulative weight loss for detonation sprayed NiCr, $Al_2O_3-13TiO_2$ coated as well as bare GI250 and GIHC specimens increases with increase in load.
- The Cumulative weight loss for $Al_2O_3-13TiO_2$ coating was observed to be minimum in the present study.
- The $Al_2O_3-13TiO_2$ GI250 coating substrate combination has shown minimum Cumulative weight loss among all the combinations. The wear resistance for coating-substrate combinations in their decreasing order (at

40N) is $Al_2O_3-13TiO_2-GI250 > Al_2O_3-13TiO_2-GIHC > NiCr-GI250 > NiCr-GIHC > Uncoated GI250 > Uncoated GIHC$

ABSTRACT: Water scarcity is a burning problem for the hill agrarians, as the same is limited particularly during dry period and no irrigation facilities are available except in the valleys where it is possible with perennial water sources. Usually, downstream reaches of the hilly region faces the flood during the monsoon season and drought during the non-monsoon season due to the available topographical variation. Therefore, in this region rainfall amount, variability and distribution pattern plays a vital role in pragmatic planning and management of natural resources. Considering all points and the indispensable role of water in domestic purpose, agriculture, horticulture, animal husbandry, fisheries and forestry, etc., drought analysis of Gagar watershed located in Nainital district of Uttarakhand, have been statistically accomplished. Weekly rainfall data was observed to be more useful for planning of irrigation schemes, cropping patterns, design of natural resources conservation and management measures so as to mitigate situations like flood, and managing harvested rainfall in drought conditions.

Key words: Rainfall behaviour, Drought Investigation, Kumaon region, Crop planning, Watershed management

I. INTRODUCTION

Rainfall plays significant role in deciding the severity of drought prone area in a particular region. In a rainfed farming region, the crop irrigation scheduling is also preferred by analysing the pattern of rainfall in a season. Various water conservation techniques such as rain water harvesting, rainfall cistern system, etc. are all rainfall dependent. Therefore, for implementation of preferential conservation measures, it is essential to study rainfall behaviour in terms of information on rainfall amount, duration and intensity of drought. Rainfall trend analysis performed from past records of rainfall can be used to generate future scenarios of rainfall occurrence and could be useful particularly in rainfed farming areas.

Sharma et al. (1979) analysed annual, seasonal, monthly and weekly rainfall data of Pantnagar. They reported that weekly data of rainfall was found to be more useful than monthly, seasonal or annual data for planning of cropping programme as well as for water management practices Bertoni et al. (1992) studied on rainfall-based real-time flood forecasting. A conceptual rainfall-runoff model (IPH-II) for real time flood forecasting and a simplified stochastic model. The methods were tested using data from a small watershed (the river Ray at Grendon Underwood, UK), for which 17 years of records were available. The results showed that a simple method used to forecast rain falling during the next few hours, might help to improve real-time discharge estimates. Suresh et al. (1993) conducted a study at Pusa (Bihar) for rainfall data of 26 years (1969-1985) by including characteristics and variation in rainfall with respect to normal, abnormal and drought months in a year by using Weibull's method and reported that at 90 per cent probability level the expected annual rainfall obtained was below the drought level and during Rabi season there was hazardous distribution of rainfall. Subudhi et al. (1996) analysed 28 years' rainfall data at Phulbani and based on probability analysis, suggested the crop varieties with growing period of four months from June to September for Phulbani under rainfed conditions. In this paper an attempt has been made to carry out the probability drought analysis on the basis of weekly rainfall data for Gagar watershed of Uttarakhand.

II. MATERIALS AND METHODS

Drought is the period of abnormal dry weather condition / deficit rainfall resulting in moisture stress condition and hydrological disparity of the system It is one of the important parameter for planning and management of various sectors such as agriculture, industrial, domestic, etc. particularly, in rainfed and water scarce region. In this research an attempt has been made to investigate the drought over the Gagar watershed located in Kumaon region of Uttarakhand.

A. Study Area

The study area i.e. Gagar watershed consists the Research Station of Govind Ballabh Pant University of Agriculture and Technology, Pantnagar and nearby area, forming the watershed, which is located near Bhowali in Nainital district of Uttarakhand state in India as shown in Fig 1. The watershed, covering an area of 603.02 ha is located between 79° 31' 43" E to 79° 33' 24" E longitude and 29° 24' 38" N to 29° 26' 43" N latitude. The elevation varied from 1413 to 2380 m above mean sea level (MSL).

Slope, drainage, shade cast etc. are the important elements of topography. There was a lot of variation in the topography of the study area. In conformity with the dramatic altitudinal and climatic differences, the region supported variety of forest ecosystems. Mixed forests predominated in the area. The land slope varied from 2 to 75%. The soils of the Gagar watershed varied from extremely acidic to medium acidic with high organic matter content. These soils were fairly

deep and moderately permeable. Very strongly acidic to medium acidic soils were also found at higher elevations, where rainfall was high and strong enough to leach down the bases from the soil minerals under temperate climatic conditions.

The climate of the region was humid temperate but variations existed which largely depend upon the altitude and geological differences. The most common factors which lead to the development of microclimate were altitude, aspect, slope, drainage condition, vegetation etc. The valleys were hot in summer and cold in winter. The minimum temperature of the area was found to be -4°C in the month of January and maximum temperature was 41°C in the month of May. The average rainfall in the study area was found to be 1040 mm, of which 70 to 80 per cent was received between June to September. With further increase in elevation, rainfall tended to decrease.

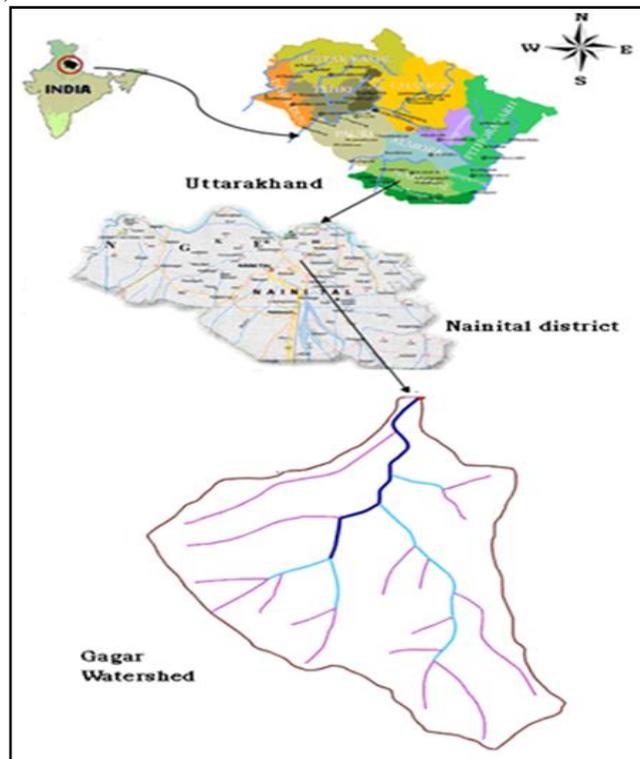

Fig. 1. Drought-rainfall distribution at Gagar watershed

Directional aspect played very important role in the development of vegetation, particularly at higher altitudes. Southern aspect was exposed to more insolation. The insolation on southern aspect was about 1.5 to 2.4 times higher than that of northern aspect. East and west aspects though received an equal amount of insolation; eastern aspect received the highest insolation during morning, before the air temperature becomes fully warm. Western aspects were comparatively hotter and drier than eastern aspects. The difference in the temperature on different aspects of the hills was the result of difference in insolation. The southern aspect was warmest and northern aspect was the coolest. Aspect plays an important role in receiving the rainfall and snowfall. Soil formation is also effected by it.

Drought Analysis

Rainfall data were collected from Agro meteorological Observatory of G. B. Pant University of Agriculture and Technology located at Gagar, Nainital, Uttarakhand which covers the study region of Gagar watershed. The data were organized in to 52 standard meteorological weeks in which each year, 8 days were counted in 52nd meteorological week and in 9th meteorological week in case of leap years and analysed for their yearly, monthly and weekly behaviour.

In this research, the monthly and yearly total rainfall was determined for each year. The monthly and yearly events were then classified as drought, normal and surplus using the following criteria.

- **Drought Month:** The month was classified as drought month in which precipitation received was less than 50 per cent of average monthly rainfall.
- **Surplus Month:** The month was classified as surplus month in which precipitation received was more than twice of average monthly rainfall.
- **Normal Month:** The month was classified as normal month in which precipitation received was in between 50 per cent and 200 per cent of average monthly rainfall.
- **Drought Year:** The year was classified as drought year in which precipitation received was less than or equal to $\bar{x} - \sigma$, where \bar{x} is mean annual precipitation and σ is standard deviation.

- Surplus Year: The year was classified as surplus year in which precipitation received was more than or equal to $\bar{x} + \sigma$.
- Normal Year: The year was classified as normal year in which precipitation received was $\bar{x} \pm \sigma$, i.e. in between $\bar{x} - \sigma$ and $\bar{x} + \sigma$.

To study the drought proneness of area and likely extend of drought following definitions were used. According to Ministry of Agriculture (1976), agricultural drought is an occasion when the rainfall in the week is half of the normal rainfall and normal rainfall should be 5 mm or more. If there are four such consecutive weeks in rainy season, the area may be classified as drought affected. According to Irrigation Commission (1972).

RESULTS AND DISCUSSION

A. Drought, Normal and Surplus Months

On the basis of definitions outlined earlier, the rainfall for a month to be normal, surplus and drought with the average rainfall are given in Table 1. There was very less rainfall in the month of November (average rainfall of 2.19 mm) for the period of study and overall 7 months of November out of 10 months were observed as drought months, therefore, November was categorized as drought month.

Table 1. Monthly rainfall to be drought, surplus and normal month with average rainfall at gagar watershed

Month	Avg. rainfall (mm)	Drought (less than)	Surplus (more than)	Normal (in between)
January	61.05	30.52	122.10	30.52 - 122.1
February	90.94	45.47	180.08	45.47 - 180.08
March	75.99	37.99	151.99	37.99 - 151.99
April	47.08	23.54	94.17	23.54 - 94.17
May	77.56	38.78	155.11	38.77 - 155.11
June	112.86	56.43	225.72	56.43 - 225.72
July	272.19	136.09	544.38	136.09 - 544.38
August	251.83	125.91	503.66	125.91 - 503.66
September	144.33	72.17	288.66	72.165 - 288.66
October	41.54	20.77	83.09	20.72 - 83.09
November	10.04	5.02	20.08	5.02 - 20.08
December	32.56	16.27	65.12	16.27 - 65.12

Month wise and year wise distribution of number of months to be drought, surplus and normal are shown in Table 2 and 3, respectively.

Table 2. Month wise distribution of number of months to be drought, surplus and normal at gagar watershed

Month	Drought Month	Normal Month	Surplus Month
January	5	4	1
February	3	5	2
March	4	5	1
April	2	6	2
May	4	5	1
June	1	9	0
July	1	9	0
August	2	8	0
September	4	5	1
October	5	2	3
November	7	0	3
December	4	4	2
Total	42	62	16

From the Table 2 and 3, it can be observed that about 51.67 per cent months were normal months during the period of 10 years (1998 to 2007). It was observed that during this 10 years period, 35.00 per cent months were drought months. Maximum number of normal months in a year was found to be 9, which accounted for only 20 per cent of total years. Most of the drought months had occurred in the post and pre-monsoon periods i.e. October to May having highest frequency for November (7 drought months out of 10 months).

Table 3. Year wise distribution of number of months to be drought, surplus and normal at gagar watershed

Year	Drought Month	Normal Month	Surplus Month
1998	2	9	1
1999	8	3	1
2000	4	7	1
2001	7	5	0
2002	4	7	1
2003	2	10	0
2004	4	6	2
2005	3	7	2
2006	5	6	1
2007	3	5	4
Total	42	65	13

It was also observed that, frequency of occurrence of normality was highest in the month of June and July followed by August, April, February - March – May – September, January and December. It can also be seen that during monsoon, the percentage distribution of drought months was, 40.00, 20.00, 10.00 per cent for, September, August, July-June, respectively, which indicated the assured rainfall during these months. The maximum number of surplus months in a year was 3, occurred during 20.00 per cent of the total years. Normality for the month of June-July was found to be 90.00 per cent followed by August (80%), April (60%), February-March-May-September (50%), January-December (40%) and October (20%). During the monsoon period (June to October), 66 per cent of the total months were normal, 26 per cent under drought and rest 8 per cent were surplus, while for the other period the normality was 41.43 per cent.

During the Rabi season i.e. October to February, out of total 50 months, the number of drought months was worked out to be 24, which was accounted for 48 per cent of the total rabi months. This indicated the likelihood of failure of Rabi crops under rainfed conditions. The percentage distribution of drought months during Rabi season was 70.00, 40.00, 30.00, and 50.00 percent during November, October-December, February and January, respectively.

B. Drought, Normal and Surplus Years

The average or mean annual rainfall was 1040.39 mm and standard deviation for the study region was found to be 302.62 mm. Therefore, any year receiving the rainfall less than or equal to 737.77 mm will be a drought year. Thus, as per the definition for drought year, described in previous chapter, 20.00 per cent of years (1999 and 2001) received rainfall less than 949.54 mm, would be drought years. Distribution of drought years is shown in Fig. 2.

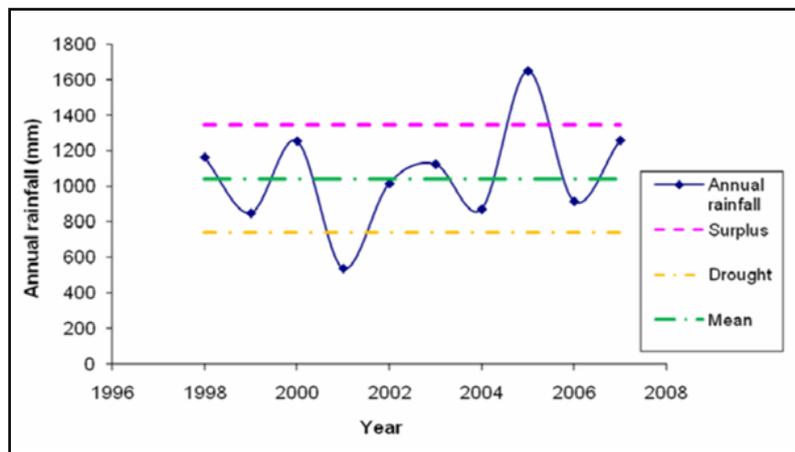

Fig. 2. Drought-rainfall distribution at Gagar watershed

Any year receiving the rainfall equal to or more than 1343.01 mm will be the surplus year, therefore, 10.00 per cent of the year which received rainfall equal to or more than 1343.01 mm (2005) was the surplus year for the period under study. Years receiving rainfall between 737.77 mm and 1343.01 mm would be the normal year. Therefore, remaining 70.00 per cent of years (1998, 2000, 2002, 2003, 2004, 2006 and 2007) were normal years for the period of analysis. Thus, it was inferred from the study that, there were about 70 per cent chance of year to have normal rainfall, 20 per cent chance of year to be the drought year and very less chance of year to be surplus (10%).

III. CONCLUSION

Drought analysis based on rainfall data of Gagar watershed was computed based on weekly rainfall. The analysis indicated the likelihood of failure of Rabi crops under rainfed conditions. It can be seen that during monsoon, the percentage distribution of normal, drought, surplus months was 66, 26, and 8 percent, respectively. It was also inferred from the study that, there was about 70 per cent chance to have normal rainfall year, 20 per cent chance to be the drought year and very less chance to be surplus year (10%). The paradigm developed from analysis of normal, surplus and drought months/years will be useful for planning of various agricultural operations such as sowing, irrigation scheduling schemes, etc. for the area.

Use of IEEE 802.11e to Ensure the Quality of Service (QoS) For Multimedia Streaming

V. REVATHI¹, S. VANITHA²

¹ PG Student, Department of ECE, SNS College of technology, India

² Assistant Professor, Department of ECE, SNS College of technology, India

ABSTRACT: Multimedia streaming is a key service provided by certain home appliances. A home network helps to control home appliances, to connect the internet and to use data in home server. A large bandwidth and real time operations are required for multimedia streaming services that consist of large amount of data and require sufficient bandwidth and delay variation to achieve the good quality of service. It is difficult for WLAN to guarantee a high QoS with respect to bandwidth and delay. Hence 802.11e standard is designed to solve this problem. It has Hybrid Coordination Function (HCF) and Enhanced Distributed Coordination Function (EDCF) to support QoS that could not be supported in the 802.11 standard. The Hop-Based Priority (HBP) technique using 802.11e is used for ensuring a good QoS for multimedia streaming. In HBP technique, the multimedia streaming data packets are assigned a higher priority after every hop. So that each packet increases the priority and minimizes the contention between the packets. We propose HBP technique in Adhoc mesh network. The wireless mesh network has been an emerging technology, since many routes may randomly exist and some routes have a lower priority than other routes at cross route node and cannot obtain the channel. For this, label switching routing protocol is used for the efficient transmission to reduce the delay and improve the throughput.

Keywords: Multimedia streaming, 802.11e EDCF, Hop-based priority technique, label switching routing protocol.

I. INTRODUCTION

Networks have evolved from wired to wireless. Recently, users of wireless LAN (WLAN) like laptop computer, PDA, mobile internet devices are increasing rapidly. WLAN supports scalability, flexibility and ubiquity, and these features make WLAN more popular. Especially, wireless multi-hop network has overcome the limit of WLAN's communication range. The applications and services of wired and wireless networks are not different. Quality of Service (QoS) is a key problem of today's IP networks.

In wireless environments, bandwidth is scarce and channel conditions are time-varying and sometimes highly lossy. Although IEEE 802.11 Wireless LAN (WLAN) is the most widely used WLAN standard today, it cannot provide QoS support for the increasing number of multimedia applications. Since multimedia streaming services have to be played in real-time, a large bandwidth is required. Services that need a good Quality of Service (QoS) like Voice over IP (VoIP) and multimedia streaming can be provided through wireless networks. However, WLAN cannot provide good QoS with respect to bandwidth and delay. High collision rate and frequent retransmissions cause unpredictable delays and jitter, which degrade the quality of real-time voice and video transmission. So IEEE 802.11e is the MAC enhancement standard used for providing QoS for the real-time applications. In this paper we analyze the Hop-Based Priority technique in multicast network and propose a solution for it.

II. IEEE 802.11E OVERVIEW

The upcoming IEEE 802.11e wireless LAN standard is the MAC enhancement standard for providing QoS capabilities in the emerging wireless local area networks. For achieving QoS, IEEE 802.11e uses multiple queues for the prioritized and separate handling of different traffic categories (TCs). IEEE 802.11e introduces the Enhanced Distributed Coordination Function (EDCF) and the Hybrid Coordination Function (HCF).

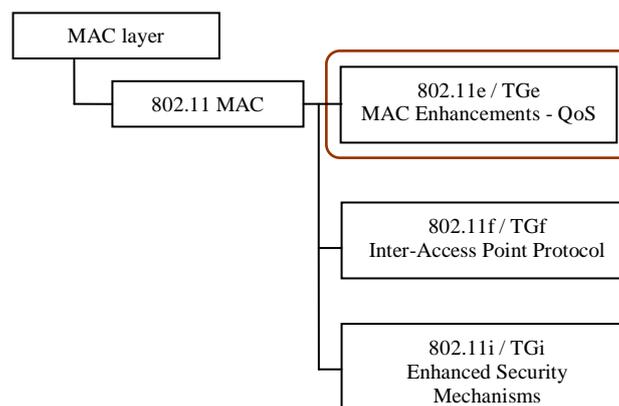

Figure 1 802.11 MAC

The 802.11e MAC is based on both center controlled channel access and contention-based channel access mechanisms. Figure 1 specifies the legacy 802.11 MAC with MAC enhancement scheme for supporting QoS. The 802.11e enhances the Distributed Coordination Function (DCF) and Point Coordination Function (PCF) both the

2.1. Hybrid Coordination Function (HCF)

HCF is the queue based service which extends the Point Coordination Function (PCF) to support the immediate sending of data. An Access Point (AP)-based infrastructure mode is used in HCF. HCF uses QoS-Enhanced Access Point (QAP) as a traffic director for different queues. HCF uses two modes of operation: HCF Controlled Channel Access (HCCA) is contention free, Enhanced Distributed Channel Access (EDCA) is contention based access mechanism. The HCF is the basis for the EDCF and controls both the contention free period (CFP) and contention period (CP). Therefore one enhanced station must be responsible for the management of the medium access. His station is denoted as Hybrid Coordinator (HC). The HC is normally co-located to the access point (AP).

III. Enhanced Distributed Coordination Function (EDCF)

EDCF supports priority upon DCF. EDCF introduces the concept of traffic categories. EDCF provides differentiated, distributed channel accesses for frames with eight different priorities (from 0 to 7) by enhancing DCF as specified in Table 1.

Table 1 User traffic priorities mapped to access categories

User Priority	Access Category	IEEE 802.11E Service Type
1	AC_BK	Background
2	AC_BK	Background
0	AC_BE	Best Effort
3	AC_BE	Video
4	AC_VI	Video
5	AC_VI	Video
6	AC_VO	Voice
7	AC_VO	Voice

EDCF establishes a probabilistic priority mechanism to allocate bandwidth based on traffic categories. Distinct from the legacy DCF, the EDCF is not a separate coordination function rather, it is a part of HCF of 802.11e MAC. Each frame from the higher layer arrives at the MAC along with the specific priority value. Then, each QoS data frame carries its specific priority value in the MAC header frame. 802.11e station implements four access categories where an access category is an enhanced variant of DCF 0.

The EDCF enhances the 802.11 DCF by introducing an own backoff instance with a separate backoff parameter set for each priority queue. Each TC on a station contends for a transmission opportunity (TXOP). A TXOP is defined as "an interval of time when a station has the right to initiate transmissions, defined by a starting time and the maximum duration".

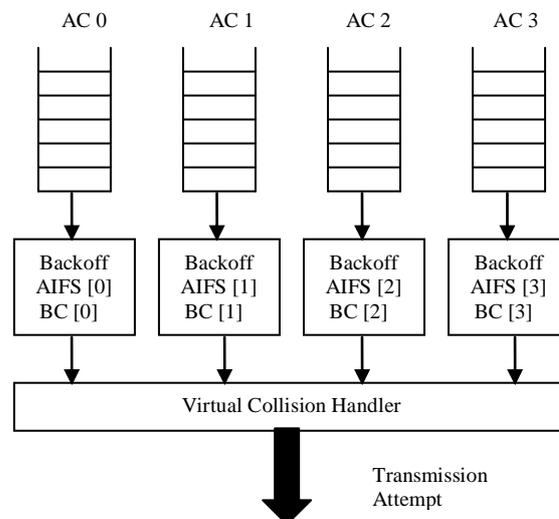

Figure 2 Four access categories for EDCF

Figure 2 shows the four transmission queues of 802.11e MAC, where each queue has its own AIFS and maintains its own backoff counter [12]. Each queue contends for Transmission Opportunity (TXOP) to send the packets. When more than one access categories compete for the backoff at the same time then collision is handled virtually. It means, the highest priority frame among the colliding frames is transmitted and the other frames perform a backoff.

An access category uses AIFSD [AC], CWmin [AC] and CWmax [AC] instead of DIFS, CWmin and CWmax of DCF respectively for the contention process to transmit the frame. AIFSD [AC] is given by,

$$\text{AIFSD [AC]} = \text{SIFS} + \text{AIFS [AC]} * \text{SlotTime}$$

Where AIFS [AC] is an integer greater than 0. The EDCF channel access mechanism is shown in Figure 3.

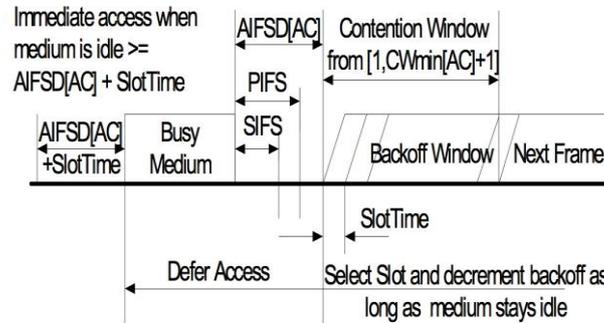

Figure 3 IEEE 802.11e EDCF channel access

EDCF => Enhanced Distributed Channel Access (EDCA).

IV. HOP-BASED PRIORITY TECHNIQUE

The Hop-Based Priority (HBP) technique using 802.11e EDCF is used for minimizing the contention between the hops. A previous packet contends with a next packet when packets try to transmit to a destination through a route. If the previous packet and next packet have the same priority and contend with each other by a fair condition which means the probability of gain of each packet in the channel is 50%. The effect that the next packet cannot get the channel by contention with the previous packet is small. If the next packet wins the previous packet and transmits one more hop, it cannot transmit more hops until the previous packet transmits. This causes the delay to decrease and bandwidth to increase. So the previous packet has a highest priority than the next packet every time.

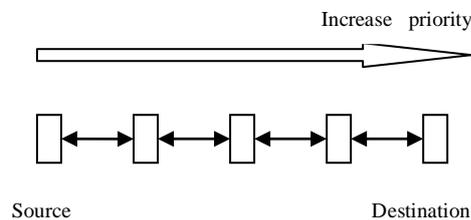

Figure 4 Hop-by-hop increases in priority

In order to avoid this contention between the previous and next packets Hop-based priority technique is used. In HBP, each packet increases the priority after every hop and minimizes the contention between the packets as specified in Figure 5. In other words, a priority is assigned to each hop and a packet is assigned a higher priority after each hop. The inter-packet delay is constant in HBP. The HBP technique uses 802.11e EDCF which can control the channel gain on the basis of priority.

V. RELATED WORK

Most of the previous work on wireless LAN specifies the QoS using various mechanisms.

In [2], A. Ksentini et al. introduced a new cross-layer architecture that ensures H.264 video transmission over IEEE 802.11-based wireless networks. This architecture achieves better performances in terms of delays and loss rate than actual WLAN standard and QoS enhancement mechanism and increases the video quality.

In [3], Q.Zhang et al. proposed a new multimedia streaming TCP-friendly protocol (MSTFP) and a novel quality-adaptation resource allocation scheme to periodically estimate the available bandwidth using MSTFP. It achieves the improvement in end-to-end QoS.

In [4], H. Gharavi et al. proposed a cross-layer feedback mechanism with a rate control approach. This method effectively controls the packet-loss rate by avoiding excessive packet drops, which could affect the resynchronization process at the decoder.

In [5], Antonio Grilo et al. presented a scheduling algorithm- Scheduling Based on Estimated Transmission Times—Earliest Due Date (SETT—EDD) for QoS provisioning in IEEE 802.11e WLANs. SETT-EDD achieves better performance in the transmission of streamed video.

VI. PRIOR WORK

The main objective of this paper is to improve the Quality of Service(QoS) for multimedia streaming services in IEEE 802.11e standard using Hop Based Priority(HBP) technique. The Hop Based Priority(HBP) technique is used in IEEE 802.11E Standard. IEEE 802.11 Wireless LAN(WLAN) is one of the most deployed wireless technologies in all over the world and is likely to play a major role in next generation wireless communication networks. The IEEE 802.11 wireless LAN has simple and robust WLAN which offers time-bounded and asynchronous services.

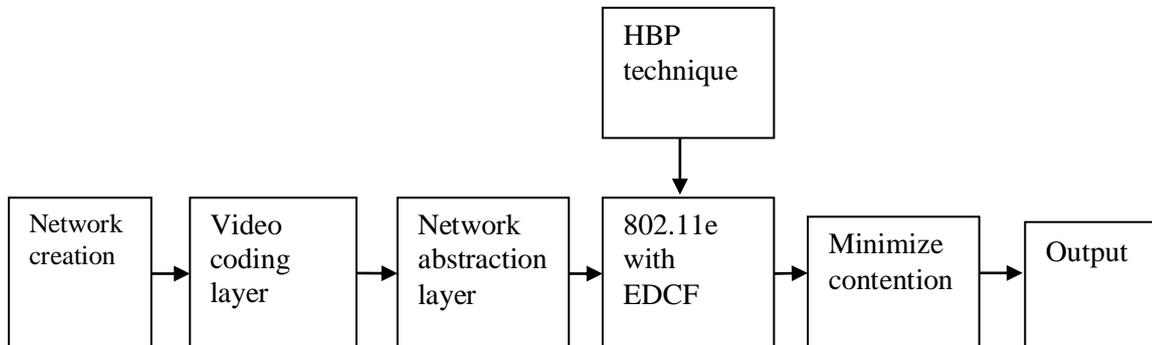

Figure 5 Block diagram of HBP with mesh network

5.1 Wireless network creation

The network topology in an ad-hoc network is highly dynamic due to the movement of nodes; hence an on-going session suffers frequent path breaks. Disruption occurs, either due to the movement of intermediate nodes in the path or due to the movement of end nodes. Such situations do not arise because of reliable links in wired networks where all the nodes are stationary. Even though wired network provides high reliability with low cost but the Quality of Service (QoS) is not provided in the better way. So the wireless ad-hoc networks must be used able to perform efficient and effective mobility management. The simulation time required to create wireless network is 15M. The following two parameters stand for the physical terrain in which the nodes are being simulated. For example, the following represents an area of size 100 meters by 100 meters. All range parameters are in terms of meters.

TERRAIN – DIMENSIONS (800,800)

The following parameter represents the number of nodes being simulated.

NUMBER-OF-NODES 10

5.2 Video coding packet

Requirements of multimedia streaming are different from those of a general file transfer. Bandwidth is the most important factor in a file transfer. A large bandwidth leads to a short transfer time and guarantees a good QoS. However, streaming has variable requirements with respect to the type of streaming service. Bandwidth is important in multimedia streaming. Multimedia data size typically ranges from a few megabytes to a few gigabytes. These large amounts of data require sufficient bandwidth to minimize buffering. If sufficient bandwidth is not guaranteed, then multimedia streaming service must have periodic buffering or download all multimedia data before play. Therefore, bandwidth is an important factor for multimedia streaming. Another important requirement for multimedia streaming is the delay variation or jitter. Buffering for multimedia streaming is decided by the delay variation. When the delay variation is large, the buffering time increases considerably in order to minimize the effect of delay. Delay is determined upon the initialization of multimedia streaming. If a delay spike occurs after initialization, additional buffering is required and a low quality of multimedia is experienced. In ad-hoc network, Ad-hoc On-demand Distance Vector (AODV) protocol maintains a routing table for an entry (destination) with a hop count (number of hops from source to destination) and a sequence number. This can be used by the application to control the transmission rate in accordance with the hop count. If a route change is the consequence of a link breakage, any intermediate node (between the source and the destination) detecting the link breakage (to the next hop) will send the route error (RERR) message back to the source node. Therefore, the source node may use the reception of RERR as an indication of a link breakage. As soon as a new route is established, the application layer, upon receiving the hop-count information from the routing layer, can adjust its bit rates in accordance with the permissible transmission rate. In the case of video communications, the bit rates can be adjusted by changing the value of the Quantization Parameter (QP). This parameter has been specifically defined in the syntax structure by all video coding standards as a means to control the video transmission rate. Here, a new video-coding standard such as H.264 Advanced Video Coding (AVC) is used. H.264 AVC is a standard capable of providing good video quality at substantially lower bit rates than previous standards (H.263 or MPEG-4), without increasing the complexity of design so much that it would be impractical or excessively expensive to implement. An additional goal was to provide enough flexibility to allow the standards to be applied to a wide variety of applications on a wide variety of networks and systems, including low and high bit rates, low and high resolution video, broadcast and ITU-T multimedia telephony systems.

5.3 Network abstraction layer

Cross-layer architecture is designed for H.264 AVC. Such a cross-layer architecture is based on two main interactions with 802.11e. First, a top-down cross-layer interaction allows the H.264 network abstraction layer (NAL) video delivery module to transmit the QoS information related to the video fragment priority to the network layer. Second, a second top-down cross-layer interaction allows the network layer, in turn, to express the same QoS exigencies to an EDCA-BASED MAC layer.

5.4 Hop-based priority

Multimedia streaming services require sufficient bandwidth and delay variation to achieve the good Quality of Service (QoS). Previous ad-hoc networks could not satisfy these requirements since 802.11 requires an ad-hoc wireless network with 802.11 to have a contention between the previous and next hops. This leads to delay fluctuation and additional back-off time due to collision. These, in turn, decrease the network bandwidth. The Hop-based priority (HBP) technique using 802.11e is used for minimizing the contention between hops. A previous packet contends with a next packet or a later sent packet when the packets try to transmit to a destination through a route. The previous packet and the next packet have the same priority and contend with each other by a fair condition. It brings the probability of the gain of each packet in the channel to 50%. The effect that the next packet cannot get the channel by contention with the previous packet is small. If the next packet wins the previous packet and transmits one more hop, it cannot transmit more hops until the previous packet transmits. In other words, winning of the previous packet from the next packet causes the delay to decrease and the bandwidth to increase. Therefore, the previous packet has a higher priority than the next packet every time. Hence, HBP technique is used to avoid the contention between the previous and the next packets. In other techniques, every packet has a fixed priority, and the previous packet and the next packet contend with each other. In HBP, each packet increases the priority after every hop and minimizes the contention between the packets.

5.5 Comparison

The performance of the proposed Hop-based priority technique using 802.11e is measured by the throughput and delay. The throughput comparison is made based on the delay variation between various IEEE 802.11 standard with 802.11e standard. First the analysis of delay in 802.11 WLAN is made. The delay in 1-hop transmission is denoted as

$$T_{trans} = T_{bas} + T_{cont} + T_{col} \quad (3.1)$$

T_{trans} denotes the time of 1-hop transmission. T_{bas} is the basic transmission time. T_{cont} and T_{col} are the additional delay caused by the loosening of contention and collision. T_{bas} is the total sum of the DCF interframe space (T_{dif}), random backoff (T_{ran}), transmission data (T_{data}), short interframe space (T_{sifs}) and transmission acknowledgement (T_{ack}) time.

$$T_{bas} = T_{dif} + T_{ran} + T_{data} + T_{sifs} + T_{ack} \quad (3.2)$$

T_{ran} is based on the size of the contention windows (CWs) and can be calculated.

$$T_{ran} = (CW_{max} + CW_{min}) * slot_time / 2 \quad (3.3)$$

T_{const} has a probability related to the loosening for contention (P_{loose})

$$T_{const} = P_{loose} * (T_{dif} + T_{data} + T_{sifs} + T_{ack}) \quad (3.4)$$

When a collision occurs, 802.11 operates the random backoff and attempts to transmit the data.

The total delay can be calculated by $T_{tran} * (\text{number of hops})$. In 802.11e with HBP, the total delay has to be calculated because the priority changes at every hop.

VII. PROPOSED WORK

In the previous work, HBP technique is used in wireless multi-hop networks to avoid the contention between the packets. 802.11e EDCF supports eight priorities, which implies that HBP technique has a limit of eight hops. We propose a Wireless Mesh Networks (WMN) using HBP technique which has a number of features that distinguish from wireless multi-hop networks. First, the positions of nodes of a WMN are relatively fixed it means any change of position is limited within certain range. The implication of this is that routing paths can be created that are likely to be stable. This reduces the need for routing packet overhead. Second, unlike pure ad-hoc networks, where the traffic flows between arbitrary pairs of nodes, in WMN, all traffic is either to or from a designated gateway, which connects the wireless mesh network to the Internet. The relevance of this point is that the traffic may be split over multiple gateways, so as to reduce the load within any given portion of the network. Third, the nodes will typically have access to a power source, and so power consumption is not a critical issue.

Packet delay is caused by various reasons, including collision resolution during packet forwarding, packet buffering, and different scheduling algorithms [13]. However, the most critical cause is packet delay in WMN is path length. Under the same traffic intensity, a smaller number of hops would lead to less packet delay. For two nodes, S (x_S, y_S) and D (x_D, y_D), in a grid network, their shortest distance is given in equation,

$$d = |x_S - x_D| + |y_S - y_D| \quad \dots\dots\dots(1)$$

To minimize the packet delay, the shortest path is used. However, this must be done in the context of minimizing collisions, since highly-contended paths that are shortest are not necessarily ideal. In Label switching protocol (LSP) each packet is associated with labels. Each packet is associated with the labels. It reduces the complexity of network operation. LSP always select the shortest path. Label switching protocol is used in MPLS (Multiprotocol label switching).

5.1 Wireless mesh network

Wireless mesh networks have the potential to play a critical role as an alternative technology for last-mile broadband internet access. The positions of different nodes of a WMN are relatively fixed. It can be viewed as a special case of wireless multihop Adhoc networks, in which each node operates both as a host and as a router.

Wireless mesh networks are as with pure Adhoc networks easy to install. The setup cost for internet service providers is only gateway installation and configuration.

The most commonly used topology for wireless mesh network is a grid layout of buildings. Since each node would communicate with the gateway. In that mesh network label switching protocol is used to find the shortest path.

5.2 Label switching protocol

In Label switching protocol(LSP) each packet is associated with labels. Each packet is associated with the labels. It reduces the complexity of network operation. LSP always select the shortest path. Label switching protocol is used in MPLS(Multiprotocol label switching).

The label switching protocol(LSP) is used in the Multi protocol label switching(MPLS). It provides a foundation that supports the deployment of advanced routing services because it solves a number of complex problems:

- It addresses the scalability issues associated with the currently deployed IP over ATM overlay model.
- It reduces the complexity of the network operation.
- It facilitates the delivery of new routing capabilities that enhance conventional IP routing techniques.
- It also offers a standards based solution that promotes multivendor interoperability.

VIII. RESULTS AND IMPLEMENTATION

To validate our analysis, we have to implement the Hop-Based Priority (HBP) technique in 802.11e for wireless mesh network (WMN) in a simulator and by performing a series of simulation based experiments to test its effectiveness. Glomosim simulator is used for the simulation purpose and the simulation parameters are,

Simulation parameters

Simulation time		15M
Number of nodes	25	
Node placement		Grid
MAC protocol		802.11
Routing protocol	AODV	

We have compared the throughput of 802.11 alone the data sending rate from 800 Kbps to 1500 Kbps range. With these we are going to add HBP technique and compare the results with the current 802.11e, same as we have compared the delay of 802.11 with adding HBP technique and compare the results with current 802.11e. Then the delay and throughput comparison is made. Under the consideration for the transmission of multimedia data, the Hop-Based Priority (HBP) technique has to be implemented in 802.11e.

Table 2 Comparison table for Throughput values

DATA SENDING RATE	IEEE 802.11 VALUES	IEEE 802.11E VALUES	IEEE 802.11E WITH MESH NETWORK
800	950	950	960
900	1089	972	1102
1000	1198	1024	1223
1100	1238	1031	1298
1200	1342	1045	1395
1300	1457	1052	1564
1400	1476	1064	1599
1500	1498	1071	1612

Table 3 Comparison table for Delay values

DATA SENDING RATE	IEEE 802.11 VALUES	IEEE 802.11E VALUES	IEEE 802.11E WITH MESH NETWORK

1500	0.034	0.015	0.0275

7.1 Simulation Results

In the first module the creation of the nodes is done. The simulation time required to create wireless environment is 15M. The following two parameters (800,800) required to stand for the physical terrain in which the nodes are being simulated. The numbers of nodes being simulated are 10. The packets are transmitted from the source node (5,7) to the destination (1,3) respectively in which normal transmission of packets takes place. Since the video packet is also considered as the ordinary data packet, the transmission of the video packet takes more time which increases the delay so the throughput decreases.

IX. Output of throughput and delay

Comparing the throughput and delay values of 802.11(WLAN), 802.11e with HBP, HBP with mesh network. Here the HBP with mesh network throughput is high compare to the other throughputs. But the HBP with mesh network delay is constant(low) compare to the others delays.

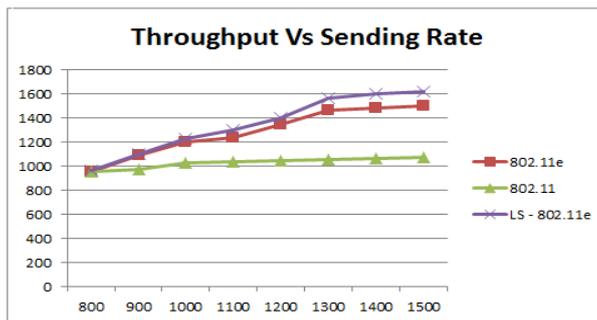

Figure 6 Throughput comparison

Figure 6 shows the throughput waveform of wireless network, x-axis shows the data sending rate in kilo bits per second(kbps), y-axis shows the throughput values IEEE 802.11, IEEE 802.11E with HBP technique and IEEE 802.11E with HBP mesh network, in kilo bits per second(kbps).

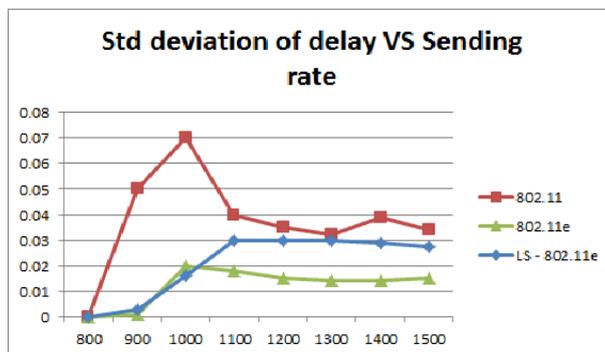

Figure 7 Delay comparison

Figure 7 shows the throughput waveform of wireless network, x-axis shows the data sending rate in kilo bits per second(kbps), y-axis shows the delay values of IEEE 802.11, IEEE 802.11E with HBP technique and IEEE 802.11E with HBP mesh network, in seconds(sec).

VIII. CONCLUSION

The usage of multimedia streaming in the wireless network is an open problem and deserves more research work. In this paper, we have analyzed the usage of multimedia streaming data packets in 802.11e using wireless mesh networks and presented the objectives that need to be achieved. Here we have shown that it is easy for the transmission of multimedia packets using hop-based priority technique in adhoc mesh networks so that the contention between the transmissions of packets is reduced with the improvement in the throughput. Which in turn increases the channel usage for the various other data transmission for the improvement in the Quality of Service (QoS). Since security is the main challenging issue, that has to be implemented in future.

Air Brake Proportional to Load

Saeed Abu Alyazeed Albatlan

*Department of Mechanical Engineering (Automotive-Branch)
 Higher Technological Institute, 10th of Ramadan City- 6th October Branch – Cairo-Egypt*

Abstract : The brake system is the primary system in an automobile which ensures its safety on the road. The ideal brake system should operate with the least effort from the driver and should stop the vehicle within the minimum possible distance without losing controllability. This paper deals with the air brake system combination valve experimental performance. The work focuses on different parameters which would affect valve characteristics. Experimental investigation of the valve characteristics under these parameters is performed and analyzed.

Keywords: Air brake; relay valve; combination valve; performance; characteristics.

I. INTRODUCTION

A brake system must ensure the safe control of a vehicle during its normal operation and must bring the vehicle to a smooth stop within the shortest possible distance under emergency conditions [1, 2]. The air brake system currently used in commercial vehicles can be broadly divided into a pneumatic subsystem and a mechanical subsystem. One of the main components in the pneumatic subsystem is the relay valve which operates the brakes on the rear axles of a tractor and the axles of a trailer. A relay valve has different modes of operation and the pressure response of the relay valve can be naturally described as the response of a hybrid system [3]. An air brake system for truck and trailer combinations comprises a vehicle load sensing valve to control brake pressure of the vehicle axles [4]. A vehicle load responsive brake control device for adjusting the braking force according to the varying load of the vehicle in each braking range; the purpose of the brake control device is to adjust the braking forces in accordance with the static and dynamic shifting of the axle loads [5]. For vehicles without electronic control of brake pressure, there is need to vary the control pressure for different load conditions. This is done in order to avoid the instability that would occur if wheels lock (start skidding) in an unsuitable order. This device is called a load sensing valve [6]. In [7] new generations of mechanical and pneumatic load sensing valves are developed with an integrated relay valve and connection to ABS to meet the requirements for modern commercial vehicles. Natarajan et al. [8] showed complete mathematical model governing the response of the relay valve in an air brake system. The development of an electropneumatic brake which would decrease the response time of the air brake system there by providing a reduced stopping distance can be found in [9]. Zhang et al. [10] developed a new modeling and simulation methodology for a pneumatic brake system with ABS widely used in commercial vehicle. The construction and operation of load sensing relay valve which is described in [11] and illustrated Fig. 1. The present paper deals with experimental investigation of performance characteristics of the combination valve at different operating conditions. A

test rig is designed and built for the study purpose, and the analysis of test results is performed.

II. MATHEMATICAL MODEL

The combination valve mathematical model can be represented in two stages according to air charged in each chamber.

2.1 Stage (1)

During apply and hold phases, when the pressure in chamber (B) increases to a level where it balances the primary piston force and the inlet valve (3) is closed.

$$A_A \times P_P = P_B (A_A + A_V) \quad (1)$$

$$P_B = P_P \times \frac{A_A}{(A_A + A_V)} \quad (2)$$

$$A_V = \frac{A_A (P_P - P_B)}{P_B} \quad (3)$$

Where:

P_B = pressure in chamber (B), bar

P_P = treadle valve pressure, bar

A_A = chamber (A) surface area = $784.37 \times 10^{-6} \text{ m}^2$

A_V = variable area, m^2

2.2 Stage (2)

During hold phase, when compressed air from the storage reservoir flows into chamber (C) and brake chamber.

$$P_B \times A_P - F_S = P_C \times A_P \quad (4)$$

$$P_C = P_B - \frac{F_S}{A_P} \quad (5)$$

Where:

F_S = spring force = 203 N

P_C = pressure in chamber (c) = brake chamber pressure, bar

A_P = primary piston surface area, m^2

Mathematical model of the load sensing relay valve constructed on Matlab /Simulink. Details about this mathematical model are given in [11].

III. Experimental Work

The objective of the experimental work is to test the air brake system with load sensing relay valve under different operation conditions, and to measure the behavior of brake pressure line. The experimental data were used to evaluate their performance characteristics.

Figure 2 shows a general layout of the test rig, which can be divided, into three main groups: test rig main components, the measuring instruments and data acquisition systems [DAQs]. The detail of each group is given below.

3.1 Test Rig Main Components

The test rig is designed and built to simulate the vehicle air brake system; the rig uses actual air brake system units and components. It allows testing different types of pressure regulator valves. The air brake system includes an air compressor (1) coupled with electric motor (2), an air reservoir (3), brake foot valve (treadle valve) (4), combination valve (5), rear brake chamber (6), rear axle wheel and hoses (7) which connect different components, as shown in Fig. 3. Air compressor actuating mechanism showed in Fig. 3 (a) consists of electric motor and V- belt connecting air compressor with motor pulley. To have a wide range of rear axle load, the load sensing lever indexing plate (8) is provided with holes which are corresponding to deflections due to different loads on the rear axle.

3.2 The Measuring Instruments

Test rig is equipped with several measuring instruments, which are necessary for performing the tests. The measuring instruments, shown in Fig. 2 include:

3.2.1 Pressure transducers

A pressure transducer is mounted at the entrance of each of the combination valve (9) from brake foot valve (treadle valve), entrance to combination valve (10) from the air tank, and output of the combination valve (11) by means of a custom designed and fabricated pitot tube fixture. The purpose of this measurement is to evaluate their performance characteristics of the valve.

3.3 Data Acquisition Systems [DAQs]

All the transducers are interfaced with a connector block through shielded cables. The connector block is connected to a DAQ board [12], (connect with computer by USB cable) that collects the data during experimental test runs. This DAQ board can measure (16-channel single ended inputs or 8 channel differential inputs) and can provide two analog output signals. The DAQ board discretizes the analog input signals using an analog-to-digital (A/D) converter (12) and the resulting digital signals are stored in the computer. An application program written in Labview is used to collect and store the data in the computer [13]. DC supply (13) is used to provide pressure sensors with the required electrical volts. All the transducers are interfaced to a lap top computer (14), through an amplifier and signal conditioning devices.

IV. Results And Discussion:

This section presents experimental results obtained in two cases. Case (I) when the valve with rear axle chamber and case (II) when the valve without rear axle chamber. The main objectives to be considered are to

evaluate the performance characteristics of the valve, study the effect of pedal travel rate on its performance and to evaluate the delay time of the valve.

4.1 Model Validation

The model is validated by comparing its performance to experimental results obtained from the test rig undergoing different load conditions with model simulation results. Figures 4, 5 show the reservoir pressure, treadle valve pressure (relay pressure) and chamber brake line pressure, plotted against the brake time, for experimental and simulation results in different cases covering the whole loading conditions range of the vehicle. The results show a good agreement between simulation and experimental results. Details about this result are given in [11].

4.2 Evaluating the Performance Characteristics of Valve.

Figures from 6 to 9 show the experimental results of the relationship between treadle valve pressure (P_1), chamber brake line pressure (P_2), and reservoir pressure (P_3), plotted against the brake time in different operation conditions. Fig. 5 represents the behavior of treadle valve pressure, and brake chamber line pressure at the same operation conditions but at different reservoir pressure in two cases, where three stages can be noticed as follows:

4.2.1 Stage (1):

During this stage the brake line pressure increases up to the required pressure whose value depends on the loading condition of the vehicle. This stage is called the apply phase, which depends on pedal travel rate and required braking force.

4.2.2 Stage (2):

The brake line pressure during this stage is constant. This stage is called the hold phase, affected by reservoir pressure, relay valve parameters and required braking force.

4.2.3 Stage (3):

This stage is called the released stage, affected by pedal release rate. Figures from 6 to 10 show lag time for the chamber brake line pressure with respect to treadle valve pressure, the values of lag time in case (I) and case (II) are 0.101, 0.15, 0.199, 0.25 and 0.049, 0.05, 0.098, 0.1 (sec.) respectively, due to increase delay period of brake system, i. e. increasing the response time of the air brake system there by a increasing stopping distance. One of the important parameters which affect the delay period of air brake system is the brake chamber conditions and pedal travel rate. From these values we can conclude that lag time increases in case (I) and variable pedal travel and decreases in case (II) and slow pedal travel. Results shown in Fig. 6 show the operation pressure of treadle valve and combination valve affected by reservoir pressure.

From Figs 6 to 10 it can be noted that:

1-The brake chamber pressure changes in proportion to loading conditions and treadle valve pressure changes according to reservoir pressure.

2-There is a lag time for the outlet pressure of valve with respect to the treadle valve pressure affected by pedal travel rate and brake chamber conditions?

4.3 Effect of cam on Air Brake System performance

Figure 11 shows the experimental result in different positions covering the whole loading condition of the vehicle at slow rate pedal travel, and indicates that the performance of valve effected by shape of cam; load sensing cam (10) in Fig. (1).

From Fig. 11 it can be noted that performance characteristics of valve affected by the shape of load sensing cam

4.4 Effect of leak on Air Brake System performance

Figure 12 represents the performance behavior of valve at one position of load, and indicates that the performance of valve is affected by any leak in air brake system, due to decrease in the pressure of each reservoir (P_3), treadle valve (P_1), and chamber brake line (P_2). This means that brake force applied is not proportional to its load due to unstable brake balance [14].

From Fig 12 it can be noted that the performance characteristics of valve affected by the leak in air brake system pressure.

V. CONCLUSIONS:

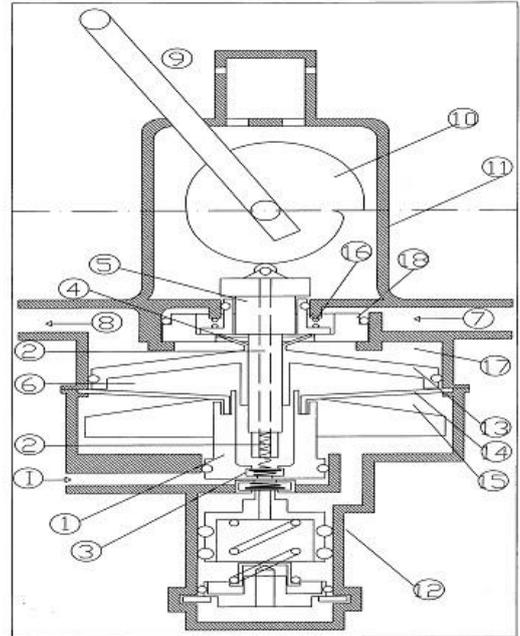

The measurements performed on the valve using the developed test rig show

1. The brake chamber pressure changes in proportion to loading conditions and treadle valve pressure according to reservoir pressure.
2. There is a lag time for the outlet pressure of valve with respect to the treadle valve pressure affected by pedal travel rate and brake chamber conditions.
3. Performance characteristics of valve are affected by
 - a- Shape of load sensing cam
 - b- Leak in air brake system pressure.

Abstract: The concept of multilevel inverters, introduced about 20 years ago entails performing power conversion in multiple voltage steps to obtain improved power quality, lower switching losses, better electromagnetic compatibility, and higher voltage capability. The benefits are especially clear for medium-voltage drives in industrial applications and are being considered for future naval ship propulsion systems. Several topologies for multilevel inverters have been proposed over the years; the most popular cascaded H-bridge apart from other multilevel inverters is the capability of utilizing different dc voltages on the individual H-bridge cells which results in splitting the power conversion amongst higher-voltage lower-frequency and lower-voltage higher-frequency inverters. Control methods based on selective harmonic elimination pulse-width modulation (SHE-PWM) techniques offer the lowest possible number of switching transitions. This feature also results in the lowest possible level of converter switching losses. For this reason, they are very attractive techniques for the voltage-source-converter-(VSC) based high-voltage dc (HVDC) power transmission systems. The paper discusses optimized modulation patterns which offer controlled harmonic immunity between the ac and dc side. The application focuses on the conventional two-level converter when its dc-link voltage contains a mix of low-frequency harmonic components. Simulation and experimental results are presented to confirm the validity of the proposed switching patterns. Finally a five level Multilevel converter topology is applied for this application

I. INTRODUCTION

The continuous growth of electricity demand and ever increasing society awareness of climate change issues directly affect the development of the electricity grid infrastructure. The utility industry faces continuous pressure to transform the way the electricity grid is managed and operated. On one hand, the diversity of supply aims to increase the energy mix and accommodate more and various sustainable energy sources. On the other hand, there is a clear need to improve the efficiency, reliability, energy security, and quality of supply. With the breadth of benefits that the smart grid can deliver, the improvements in technology capabilities, and the reduction in technology

cost, investing in smart grid technologies has become a serious focus for utilities [1].

Advanced technologies, such as flexible alternating current transmission system (FACTS) and voltage-source converter (VSC)-based high-voltage dc (HVDC) power transmission systems, are essential for the restructuring of the power systems into more automated, electronically controlled smart grids. An overview of the recent advances of HVDC based on VSC technologies is offered in [2]. The most important control and modeling methods of VSC-based HVDC systems and the list of existing installations are also available in [2]

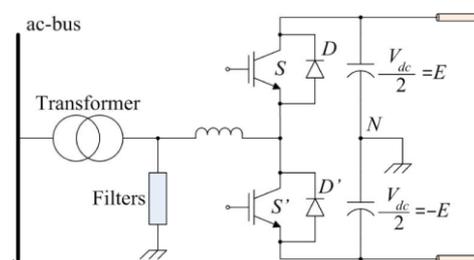

Fig. 1. Phase of the two-level VSC for the HVDC power transmission system[7].

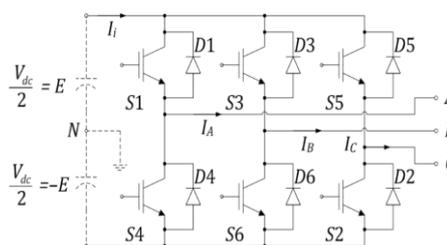

Fig. 2. Three-phase two-level VSC.

The first generation of utility power converters is based on current-source converter (CSC) topologies [3], [4]. Today, many projects still use CSCs due to their ultra-high power capabilities. With the invention of fully controlled power semiconductors, such as insulated-gate bipolar transistors (IGBTs) and integrated gate-commutated thyristors (IGCTs) [5], the VSC topologies are more attractive due to their four-quadrant power-flow characteristics [6]. A typical configuration of the VSC-based HVDC power transmission system is shown in Fig. 1 as it is shown in [7] and [8].

With the advancement of power electronics and emergence of new multilevel converter topologies, it is possible to work at voltage levels beyond the classic semiconductor limits. The multilevel converters achieve high-voltage switching by means of a series of voltage steps, each of which lies within the ratings of the individual

power devices. Among the multilevel Converters [1-4], the cascaded H-bridge topology (CHB) is particularly attractive in high-voltage applications, because it requires the least number of components to synthesize the same number of voltage levels.

Additionally, due to its modular structure, the hardware implementation is rather simple and the maintenance operation is easier than alternative multilevel converters. The multilevel voltage source inverter is recently applied in many industrial applications such as ac power supplies, static VAR compensators, drive systems, etc. One of the significant advantages of multilevel configuration is the harmonic reduction in the output waveform without increasing switching frequency or decreasing the inverter power output [5-11]. The output voltage waveform of a multilevel inverter is composed of the number of levels of voltages, typically obtained from capacitor voltage sources. The so-called multilevel starts from three levels. As the number of levels reach infinity, the output THD approaches zero. The number of the achievable voltage levels, however, is limited by voltage unbalance problems voltage clamping requirement, circuit layout, and packaging constraints.

On the other hand, optimized modulation methods offer many advantages toward tight control of converter-generated harmonics [19]. A minimization method to find the complete set of solutions by solving the SHE-PWM equations for two-level inverters is discussed in [20]. In this paper, the dc-link voltage is assumed to be constant. In [10], a method is proposed to prevent the dc-link ripple voltage from creating low-order harmonics on the ac side of fixed and variable frequency inverters. However, only one of the multiple SHE-PWM sets [20] of solutions is reported.

An investigation of the harmonic interaction between the ac and dc side for STATCOM is presented in [21] including the so-called dynamic SHE-PWM scheme based on precalculated angles for better THD. However, the dynamic SHE-PWM scheme is applied only for a three-level converter and can be applied only for known magnitude and frequency of the ripple. Another method for improving the harmonic performance of a two-level VSC with SHE-PWM is studied in [22]. However, only one set of SHE-PWM solutions is considered for the method of [22] which requires the exact values of magnitude, phase, and frequency of the ripple in order to be implemented.

Control strategies to compensate unbalances are reported in the literature. Mild imbalances caused by unbalanced loads of the ac side are regulated by using separate control loops for the positive- and negative-sequence components of the voltage as proposed in [23]. Efficient control of unbalanced compensator currents can be achieved by a control algorithm based on the D-STATCOM model [24]. D-STATCOM allows separate control of positive- and negative-sequence currents and decoupled current control of the d-q frame. An advanced strategy based on direct power control under unbalanced grid voltage conditions has been recently presented for a doubly fed induction generator [25]. To take the full advantages of VSCs for HVDC power transmission systems, an auxiliary controller is added to the main controller which is conventionally implemented in the positive-sequence d-q frame [26]. To compensate for unbalanced ac-side loads,

the auxiliary controller is implemented in the negative-sequence d-q frame.

The objective of this paper is to discuss the effectiveness of optimized modulation based on precalculated SHE-PWM in a two-level three-phase VSC to make the ac side immune from the fluctuations of the dc link without the use of passive components. However, since the VSC studied here does not include a closed-loop controller, strategies to compensate unbalances are not addressed in this paper.

This paper is organized in the following way. In Section II, a brief analysis of the VSC and the modulation method is provided. Section III contains the characteristics of the method on a VSC with dc-side ripple voltage. Section IV provides extensive experimental results to support the theoretical arguments. Conclusions are documented in Section V.

II. Analysis Of The Pwm Converter And She-Pwm

The optimized SHE-PWM technique is investigated on a two level three-phase VSC topology with IGBT technology, shown in Fig. 2. A typical periodic two-level SHE-PWM waveform is shown in Fig. 3.

The waveforms of the line-to-neutral voltages can be expressed as follows:

$$V_{LN} = \begin{bmatrix} V_{AN} \\ V_{BN} \\ V_{CN} \end{bmatrix} = V_{dc} \begin{bmatrix} \sum_{n=1}^{\infty} A_n \sin n\omega_0 t \\ \sum_{n=1}^{\infty} A_n \sin n \left(\omega_0 t - \frac{2\pi}{3} \right) \\ \sum_{n=1}^{\infty} A_n \sin n \left(\omega_0 t + \frac{2\pi}{3} \right) \end{bmatrix} \quad (1)$$

When ω_0 is the operating frequency of the ac, and V_{dc} is the dc-link voltage.

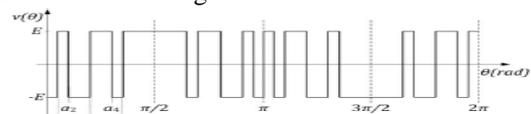

Fig. 3. Typical two-level PWM switching waveform with five angles per quarter cycle.

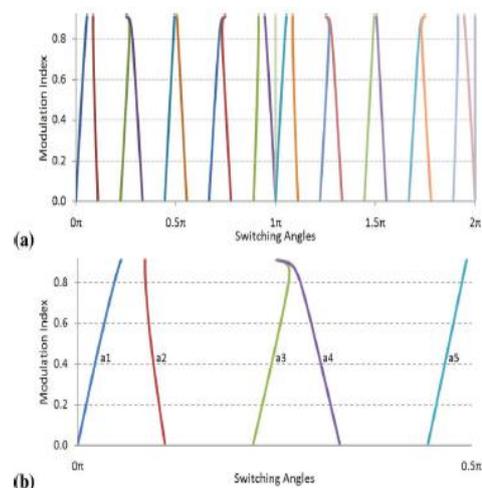

Fig. 4. Solution trajectories. (a) Per-unit modulation index over a complete periodic cycle. (b) Five angles in radians.

Thus, the line-to-line voltages are given by

$$V_{LL} = \begin{bmatrix} V_{AB} \\ V_{BC} \\ V_{CA} \end{bmatrix} = \sqrt{3} \cdot V_{dc} \begin{bmatrix} \sum_{n=1}^{\infty} A_n \sin n \left(\omega_0 t + \frac{\pi}{6} \right) \\ \sum_{n=1}^{\infty} A_n \sin n \left(\omega_0 t - \frac{\pi}{2} \right) \\ \sum_{n=1}^{\infty} A_n \sin n \left(\omega_0 t + \frac{5\pi}{6} \right) \end{bmatrix} \quad (2)$$

The SHE-PWM method offers numerical solutions which are calculated through the Fourier series expansion [20] of the waveform

$$M = 1 + 2 \sum_{i=1,2,3,..}^{N+1} (-1)^i \cos(\alpha_i)$$

$$0 = 1 + 2 \sum_{i=1,2,3,..}^{N+1} (-1)^i \cos(k\alpha_i) \quad (3)$$

Where N+1 are the angles that need to be found.

Using five switching angles per quarter-wave in (N=4)SHE-PWM, k= 5, 7, 11, 13 to eliminate the 5th, 7th, 11th, and 13th harmonics. During the case of a balanced load, the third and all other harmonics that are multiples of three are cancelled, due to the 120 symmetry of the switching function of the three-phase converter. The even harmonics are cancelled due to the half-wave quarter-wave symmetry of the angles, being constrained by

$$0 < \alpha_1 < \alpha_2 < \dots < \alpha_{N+1} < \pi/2$$

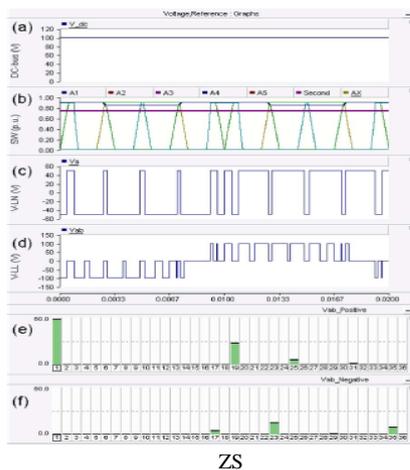

Fig. 5. Simulation results for SHE-PWM eliminating 5th, 7th, 11th, and 13th harmonics. (a) DC-link voltage. (b) Solution trajectories to eliminate harmonics and intersection points with the modulating signal (M=0.75). (c) Line-to-neutral voltage. (d) Line-to-line voltage. Figure. 13 Nine Level Line Voltage

V. CONCLUSIONS

This paper presents Novel Hybrid H-Bridge multilevel converter. The proposed converter produces more voltage levels with less number of switches compared to H- bridge configuration. This will reduce number of gate drivers and protection circuits which in turn reduces the cost and complexity of the circuit. Finally a five level single H-bridge is proposed. A SIMULINK based model is developed and Simulation results are presented.

ABSTRACT

The Diode Clamped Multilevel Inverter (DCMLI) is an attractive type multilevel inverter due to its robustness. This paper discusses new modulation strategies for a single phase five level H-bridge type DCMLI with reduced components as compared to conventional DCMLI. The chosen multi level inverter is controlled with multicarrier based Sinusoidal Pulse Width Modulation (SPWM) technique with Variable Frequency (VF), Phase Shift (PS), Carrier Overlapping (CO), Phase Opposition and Disposition (POD), Alternative Opposition and Disposition (APOD) and Phase Disposition (PD) PWM techniques. The performance of proposed strategies are evaluated through MATLAB-SIMULINK/POWER SYSTEM BLOCKSET / POWER GUL. The variation of Total Harmonic Distortion (THD), V_{RMS} (fundamental), Form Factor (FF), Crest Factor (CF) and Distortion Factor (DF) are observed for various modulation indices. The simulation results indicates that sinusoidal reference with PODPWM/APODPWM provides output with relatively low distortion. It is also seen that COPWM strategy is found to perform better since it provides relatively higher fundamental RMS output voltage.

Keywords : COPWM , DCMLI, DF, SH PWM, THD

I. INTRODUCTION

A Multi Level Inverter (MLI) can switch either its input or output nodes (or both) between multiple (more than two) levels of voltage or current. As the number of levels reaches infinity, the output THD approaches zero. The number of the achievable voltage levels however is limited by voltage imbalance problems, voltage clamping requirements, circuit layout and packaging constraints, complexity of the controller and of course, capital and maintenance costs. Three different major multilevel inverter structures have been applied in industrial applications: Cascaded H-bridge inverter with Separate DC sources(SDCS), diode clamped inverter and flying capacitors inverter. Yuan and Barbi [1] proposed fundamentals of a new diode clamping multilevel inverter. Anshuman Shukla et al [2] introduced control schemes for equalization of DC capacitor voltage in diode clamped multilevel inverter. Deepthi and Saxena [3] have discussed variation of THD in a diode clamped multilevel inverter with respect to modulation index and control strategy. NagaHaskar Reddy et al [4] have proposed a advanced modulating technique for diode clamped multilevel inverter fed induction motor. Jose Rodriguez et al [5] have presented a survey of multilevel inverters topologies, controls and applications. Yu Liu et al [6] found

a new clew for research on realtime algorithm for minimizing THD in multilevel inverters with unequal or varying voltage steps under staircase modulation. Hinago and Koizumi [7] proposed single phase multilevel inverter using switched series/parallel DC voltage sources. Xue and Manjrekar [8] developed a new class of single phase multilevel inverter. Farokhnia et al [9] made a comparison between approximate and accurate line voltage THD of multilevel inverter with equal DC sources. Farokhnia et al [10] also made a comparison between approximate and accurate calculation of line voltage THD in multilevel inverters with unequal DC sources. Rahim and Selvaraj [11] proposed multistring five level inverter with novel PWM control scheme for photo voltaic application. Shanthy and Natarajan [12] have described that the multilevel inverter triggered by the developed unipolar PWM strategies exhibits reduced harmonics and higher DC bus utilisation. PWM strategies developed are implemented in real time using dSPACE/Real Time Interface (RTI).Seyezhai [13] presented carrier overlapping PWM methods for asymmetrical multi level inverter. This literature survey reveals few papers only on various PWM techniques and DCMLI. Hence this work presents a new approach for controlling the harmonics of output voltage of chosen DCMLI fed resistive load employing sinusoidal switching reference. Simulations are performed using MATLAB-SIMULINK.

II. MULTILEVEL INVERTER

The operation of a multilevel inverter can be described as an optional stacking of a number of DC voltage source stages dependent on a certain time of operation that one stage is stacked (forward or reverse) or bypassed. MLIs also have some issues, such as requiring a big number of semiconductor switches which increases as the number of steps/levels increases and complex design for synchronous gate drivers for different levels. There are many types of multilevel inverter topologies in its history, starting from the series H-bridge design, followed by the diode-clamped, which utilizes a bank of capacitors to split the DC bus voltage and then the switched flying capacitor (or capacitor clamped) topology. An inverter design can also cascade these fundamental topologies to make hybrid topologies to improve power quality.

II. (a) Conventional DCMLI

The main concept of this inverter is to use diodes to limit the voltage stress on power devices. A DCMLI typically consists of (m-1) capacitors on the DC bus where m is the total number of positive, negative and zero levels in the output voltage. The order of numbering of the switches is S1, S2, S3, S4, S1', S2', S3' and S4'. The DC bus consists of four capacitors C1, C2, C3 and C4 acting as

voltage divider. For a DC bus voltage V_{dc} , the voltage across each capacitor is $V_{dc}/4$ and voltage stress on each device is limited to $V_{dc}/4$ through clamping diode. The middle point of the four capacitors 'n' can be defined as the neutral point. The principle of diode clamping to DC link voltages can be extended to any number of voltage levels. Since the voltages across the semiconductor switches are limited by conduction of the diodes connected to the various DC levels, the inverter is called DCMLI. The switches are arranged into 4 pairs (S1,S1'), (S2,S2'), (S3,S3') and (S4,S4'). If one switch of the pair is turned ON, the complementary switch of the same pair must be OFF. The output voltage V_{an} has five states: $V_{dc}/2$, $V_{dc}/4$, 0, $-V_{dc}/4$ and $-V_{dc}/2$. Four switches are triggered at any point of time to select the desired level in the five level DCMLI. Fig.1 shows a conventional single phase one leg five level DCMLI.

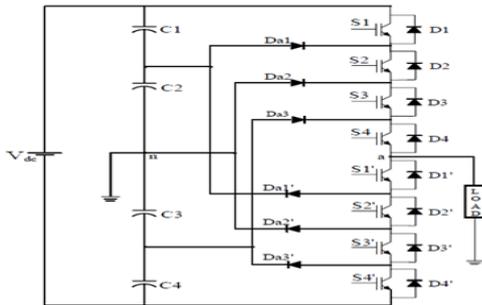

Figure 1 Conventional single phase five level DCMLI

II. (b) Chosen DCMLI

Two important issues in multilevel inverter control are obtaining near sinusoidal output voltage waveform and the elimination of the lower order harmonics. In this paper, a H-bridge type diode clamped inverter is used to propose a modified switching technique in such a way that the THD and number of components is minimized. Table 1 shows that comparisons of components used in conventional as well as chosen DCMLI. Fig.2 shows a configuration of single phase five level H-bridge type DCMLI. Here also the same output voltage states exist : $V_{dc}/2$, $V_{dc}/4$, 0, $-V_{dc}/4$ and $-V_{dc}/2$. The gate signals used for five level H-bridge type DCMLI are simulated using MATLAB – SIMULINK / POWER SYSTEM BLOCKSET / POWER GUI. The gating pulses for the inverter are generated for various values of modulation index m_a and for various PWM techniques. The chosen DCMLI is investigated with multicarrier SPWM for modulation indices ranging from 0.6-1.

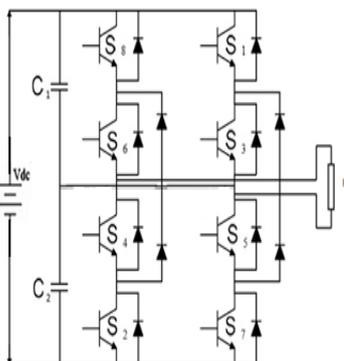

Figure 2 Chosen single phase H-bridge type five level DCMLI

Comparison between conventional DCMLI and chosen DCMLI

Type of MLI	Conventional DCMLI	Chosen DCMLI
Main power devices	8	8
Main diodes	8	8
Clamping diodes	6	4
DC bus capacitors	4	2
Balancing capacitors	0	0
No. of leg	1	2

III. MODULATION TECHNIQUE FOR SWITCHES

In this paper a control technique of carrier based SPWM strategy is present. Number of triangular waveforms is compared with a controlled sinusoidal modulating signal. The number of carriers required to produce the m- level output is m-1. All the carriers have the same peak to peak amplitude A_{cpp} . The reference is continuously compared with each of the carrier signals and whenever the reference is greater then the carrier signal, the pulse is generated. The switching rules for the switches are decided by the intersection of the carrier waves with the modulating signal. The frequency modulation index $m_f=f_c/f_o$ where f_c is the frequency of the carrier signal and f_o is the frequency of the modulating signal. The amplitude modulation index is m_a where A_0 is the amplitude of the modulating signal and A_{cpp} is the peak to peak value of the carrier (triangular) signal. The amplitude modulation indices are :

$$SHPWM \text{ and } VFPWM = 2A_o/(m-1).A_{cpp}$$

$$COPWM = A_o/(m/4).A_{cpp}$$

$$PSPWM = A_o/(A_{cpp}/2)$$

Multiple degrees of freedom are available in carrier based multilevel PWM. The principle of the carrier based PWM strategy is to use m-1 different carriers with a reference signal for a m level inverter. Differences of carriers includes carrier's frequency, carrier's amplitude, carrier's phases, carrier's DC offset and multiple third harmonic content of reference signal. This paper uses different modulation strategies that all well known carrier based multilevel PWM strategies such as PDPWM, PODPWM, APODPWM, COPWM, PSPWM and VFPWM. Fig.3 shows the sample SIMULINK model developed for PSPWM technique for chosen inverter.

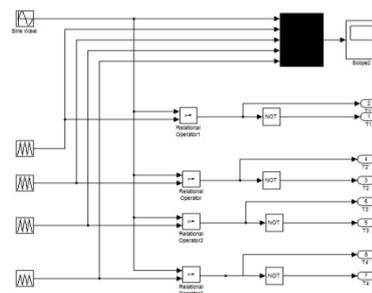

Figure 3 Sample SIMULINK model developed for chosen single phase inverter for PSPWM technique

III. (a) Phase Disposition PWM (PDPWM) Strategy

In this method all carriers have the same frequency, amplitude and phases but they are just different in DC offset to occupy contiguous bands. Since all carriers are selected with the same phase, the method is known as PD strategy. The carrier arrangement for this strategy is shown in Fig.4.

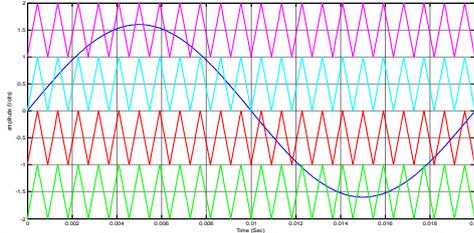

Figure 4 Modulating and carrier waveforms for PDPWM strategy ($m_a=0.8$ and $m_f=22$)

III. (b) Phase Opposition Disposition PWM (PODPWM) Strategy

The PODPWM strategy is having the carriers above the zero line of reference voltage out of phase with those of below the line by 180 degrees as shown in Fig.5.

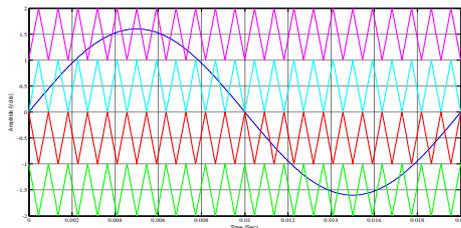

Figure 5 Modulating and carrier waveforms for PODPWM strategy ($m_a=0.8$ and $m_f=22$)

III. (c) Alternative Phase Opposition and Disposition PWM (APODPWM) Strategy

In APOD strategy each carrier is phase shifted by 180 degrees from its adjacent one as shown in Fig.6.

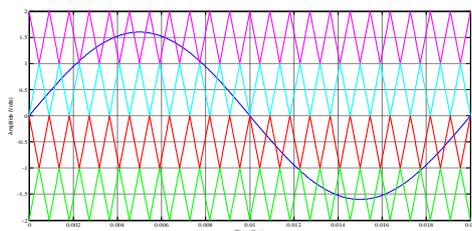

Figure 6 Modulating and carrier waveforms for APODPWM strategy ($m_a=0.8$ and $m_f=22$)

III. (d) Phase Shift PWM (PSPWM) Strategy

In this strategy all carrier signals have the same amplitude and frequency but they are phase shifted by 90 degrees to each other as shown in Fig.7.

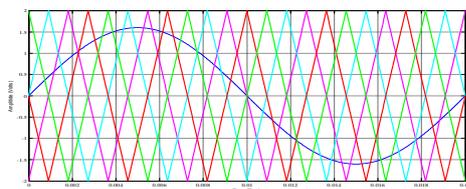

Figure 7 Modulating and carrier waveforms for PSPWM strategy ($m_a=0.8$ and $m_f=22$)

III. (e) Carrier Overlapping PWM (COPWM) Strategy

For an m-level inverter, m-1 carriers with the same frequency f_c and same peak to peak amplitude A_{cpp} are disposed such that the bands they occupy overlap each other. The overlapping vertical distance between each carrier is $A_{cpp}/2$ which is shown in Fig.8. The reference waveform has amplitude of A_o and frequency f_o and it is centred in the middle of the carrier signals.

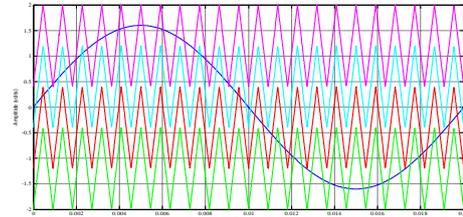

Figure 8 Modulating and carrier waveforms for COPWM strategy ($m_a=0.8$ and $m_f=22$)

III. (f) Variable Frequency PWM (VF PWM) Strategy

The number of switchings for upper and lower devices of chosen MLI is much more than that of intermediate switches in PDPWM using constant frequency carriers. In order to equalize the number of switchings for all the switches, variable frequency PWM strategy is used as illustrated in Fig.9 in which the carrier frequency of the intermediate switches is properly increased to balance the number of switchings for all the switches.

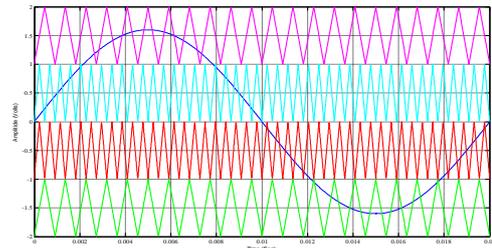

Figure 9 Modulating and carrier waveforms for VF PWM strategy ($m_a=0.8$ and $m_f=22$ for upper and lower switches)

IV. SIMULATION RESULTS

Simulation studies are performed by using MATLAB-SIMULINK to verify the proposed PWM strategies for chosen single phase H- bridge type diode clamped five level inverter for various values of m_a ranging from 0.6 – 1 and corresponding %THD values are measured using FFT block and they are shown in Table 2. Table 3 shows the V_{RMS} of fundamental of inverter output for the same modulation indices. Figs.10-21 show the simulated output voltage of chosen DCMLI and the corresponding FFT plots with different strategies but only for one sample value of $m_a=0.8$ and $m_f=22$. Fig.10 shows the five level output voltage generated by PDPWM strategy and its FFT plot is shown in Fig.16. From Fig.16, it is observed that the PDPWM strategy produces significant 12th,14th,18th and 20th harmonic energy. Fig.11 shows the five level output voltage generated by PODPWM strategy and its FFT plot is shown in Fig.17. From Fig.17, it is observed that the PODPWM strategy produces significant 15th,17th and 21th harmonic energy. Fig.12 shows the five level output voltage generated by APODPWM strategy and its FFT plot is shown in Fig.18.

From Fig.18, it is observed that the APODPWM strategy produces significant 17th,19th and 21th harmonic energy. Fig.13 shows the five level output voltage generated by PSPWM strategy and its FFT plot is shown in Fig.19. From Fig.19, it is observed that the PSPWM strategy produces significant 11th,17th, 19th and 21th harmonic energy. Fig.14 shows the five level output voltage generated by COPWM strategy and its FFT plot is shown in Fig.20. From Fig.20, it is observed that the COPWM strategy produces significant 3rd and 20th harmonic energy. Fig.15 shows the five level output voltage generated by VFPWM strategy and its FFT plot is shown in Fig.21. From Fig.21, it is observed that the VFPWM strategy produces significant 16th and 20th harmonic energy.

The following parameter values are used for simulation : $V_{DC}=440V$, $f_c=1100Hz$ and $R(load)=100\text{ ohms}$.

V. CONCLUSION

Single phase H-bridge type diode clamped five level inverter employing different multi carrier single reference modulation schemes has been investigated. It is found from Table 2 that PODPWM /APODPWM techniques provide output with relatively low distortion. COPWM technique is observed to perform better since it provides relatively higher fundamental RMS output voltage (Table 3). Table 4 shows crest factor, Table 5 provide FF and Table 6 shows DF for all modulation indices.

DESIGN OF RING ROAD FOR ERODE DISTRICT USING GIS

T.SUBRAMANI¹ P.MALAISAMY²

¹Professor & Dean, Department of Civil Engineering, VMKV Engg. College, Vinayaka Missions University,

²PG Student of Environmental Engineering, Department of Civil Engineering,
VMKV Engg. College, Vinayaka Missions University, Salem, India

Abstract: Design of ring road deals with the development of a comprehensive plan for Construction and operation of transportation facilities. In order to develop efficient and better transport facility, it is necessary to have a proper procedure transport movement. This ring road helps to a great extent in improving the safe and fast movement of both human and goods traffic, thereby increasing the economy of the City. This improved economy contributes the growth of the country. The first and foremost step is reducing the traffic for the particular route by diverting the density of the vehicles to enhance the safe transport and environmental pollution. This project deals with the traffic problem of the erode city and provides better transportation. In this project GIS is used for surveying, for preparing Contour maps, for developing three dimensional Digital Elevation Models, for various types of route alignments and for estimation of cutting and filling volumes.

The purpose of this study was to develop a tool to locate a suitable less route between two points. The GIS approach using ground parameters and spatial analysis provided to achieve this goal. Raster based map analysis provide a wealth of capabilities for incorporating terrain information surrounding linear infrastructure. Costs resulting from terrain, geomorphology, land use, drainage and elevation resulting low cost estimation for implementing the shortest routes for the study area. Finally Ring road for Erode city of 22 kms all around which connect the major roads of bypass was formulated.

Keywords: Design, ring road, Erode district, Using gis

I. INTRODUCTION

Determining the best route through an area is one of the oldest spatial problems. This problem has recently been solved effectively using GIS and Remote Sensing technologies. During the last decade, a few attempts have been made to automate the route-planning process using GIS technology. A review of a number of papers suggests that the methodology is still at an exploratory stage (Saha et al., 2005). A number of research have already been performed in pipeline route design using GIS which include optimal routing for pipeline selection of best route for expansion and road network, this will achieve by using high resolution remote sensing image. In this context, physical, environmental, political, social, economical and legal processes was considered and implemented for road and pipeline routing determination (Rylsky 2004, Saha, V.D 2005, Delevar and Naghibi 2003, Yusof and Baban 2004, Glasgow vd. 2004, Berry 2000, Çevik and Topal 2003, Luettingearve Clark 2005). Multiple factors were considered using GIS techniques for road, highway, forest

roads and bike roads routing determination (Mackenzie and Walker 2004, Malpica ve Pedraza 2001). GIS based route determination for railway (Ashish and Dhingra 2005, Kov vd. 2005, Gipps vd. 2001), irrigation/drainage channels (Yusof and Baban 2000, Smith 2006), power line (Cheng and Chang 2001) have already been implemented.

The present study was initiated to demonstrate the use of various data from different sources, GIS analysis and raster network analysis techniques for developing a least cost pathway for linear civil engineering structures. This is probably the most asked question posed to those in the Geographic Information Systems (GIS) field and is probably the hardest to answer in a succinct and clear manner.

1.2 SOFTWARE

Different software packages are important for GIS. Central to this is the GIS application package. Such software is essential for creating, editing and analyzing spatial and attribute data, therefore these packages contain a myriad of GIS functions inherent to them. Extensions or add-ons are software that extends the capabilities of the GIS software package. Component GIS software is the opposite of application software. Component GIS seeks to build software applications that meet a specific purpose and thus are limited in their spatial analysis capabilities. Utilities are stand-alone programs that perform a specific function. For example, a file format utility that converts from one type of GIS file to another. There is also web GIS software that helps serve data through Internet browsers.

1.2.1 Data

Data is the core of any GIS. There are two primary types of data that are used in GIS. A geodatabase is a database that is in some way referenced to locations on the earth. Geodatabases are grouped into two different types: vector and raster. Vector data is spatial data represented as points, lines and polygons. Raster data is cell-based data such as aerial imagery and digital elevation models. Coupled with this data is usually data known as attribute data. Attribute data generally defined as additional information about each spatial feature housed in tabular format. Documentation of GIS datasets is known as metadata. Metadata contains such information as the coordinate system, when the data was created, when it was last updated, who created it and how to contact them and definitions for any of the code attribute data.

1.2.2 Remote sensing system

With the background treatise on remote sensing we have made so far, it would now be easier make an analysis of the different stages in remote sensing.

- Origin of electromagnetic energy.

- Transmission of energy
- Intervening of energy or self emission
- Detection of energy
- Transmission or coding of the sensor output
- Collection of ground truth
- Data analysis and interpretation

1.2.3 Remote sensors

The instrument used to measure electromagnetic radiation reflected or emitted by the radiation either emitted or reflected from the earth is called passive sensors, sensors which carry electromagnetic radiation to illuminates the earth's surface are called active sensors.

1.2.4 Platforms

Sensor system need to be placed on suitable observation platforms and need to be a pre-defined altitude .Platforms can be stationary or mobile depending on the needs of the observation mission and the constraints. Geo-stationary ,which are about 3600km above earth second is sun synchronous satellites which are nearer to earth.

1.2.5 Digital Processing Techniques

Digital facilitates quantitative analysis, make use of full spectral information and avoid individual bias. Simultaneous analysis of multi-temporal and multi sensor facilitated in digital methods. The computer analysis the signature ,so as to associates each pixel with a particular feature of imagery.

1.2.6 Generation of DEM and slope

Slope map was generated using the elevation information derived from ancillary topographical and GIS techniques. ARCGIS's TOPOGRID functions were used to generate DEM and slope maps. A sampling method was used to extract representative points to build a surface model that approximates the actual surface. The contour map, was prepared from the SOI topographic.

1.2.7 Shortest Path Analysis

The inputs required for shortest path analysis are a source and a destination raster, cost raster surface, cost weighted distance, direction raster. After preparing all the required inputs Spatial Analyst is used to generate the shortest path and the results for analysis.

1.2.8 Global Positioning System

The **Global Positioning System (GPS)** is a space-based global navigation satellite system (GNSS) that provides reliable location and time information in all weather and at all times and anywhere on or near the Earth when and where there is an unobstructed line of sight to four or more GPS satellites. It is maintained by the United States government and is freely accessible by anyone with a GPS receiver. The GPS project was started in 1973 to overcome the limitations of previous navigation systems,^[1] integrating ideas from several predecessors, including a number of classified engineering design studies from the 1960s. GPS was created and realized by the U.S. Department of Defense (USDOD) and was originally run with 24 satellites. It became fully operational in 1994. In addition to GPS, other systems are in use or under development. The Russian global navigation Satellite

System (GLONASS) was in use by the Russian military only until it was made fully available to civilians in 2007. There are also the planned Chinese Compass navigation system and the European Union's Galileo positioning system.

1.2.9 How GPS Work

The Global Positioning System (GPS) is a technical marvel made possible by a group of satellites in earth orbit that transmit precise signals, allowing GPS receivers to calculate and display accurate location, speed, and time information to the user. By capturing the signals from three or more satellites (among a constellation of 31 satellites available), GPS receivers are able to use the mathematical principle of **trilateration** to pinpoint your location. With the addition of computing power, and data stored in memory such as road maps, points of interest, topographic information, and much more, GPS receivers are able to convert location, speed, and time information into a useful display format. GPS was originally created by the United States Department of Defense (DOD) as a military application. The system has been active since the early 1980s, but began to become useful to civilians in the late 1990s. Consumer GPS has since become a multi-billion dollar industry with a wide array of products, services, and Internet-based utilities. GPS works accurately in all weather conditions, day or night, around the clock, and around the globe. There is no subscription fee for use of GPS signals. GPS signals may be blocked by dense forest, canyon walls, or skyscrapers, and they don't penetrate indoor spaces well, so some locations may not permit accurate GPS navigation.

1.2.10 Types of GPS for Driving, Outdoors, Sports

Imagine never being lost or needing to ask for directions as you drive. Imagine going out for a run or bike ride and capturing all of your speed, distance, elevation change and heart rate data and uploading it to a training log or an online map you can share. Imagine going hiking and always knowing the way back to camp. Imagine playing golf and always knowing the exact distance to the pin. These scenarios and many more are reality with the use of Global Positioning System (GPS) receivers.

II. Aim And Scope Of Investigation

- To establish shortest path for road network.
- To minimize the traffic in the city.
- To provide a better and comfortable for updating the traffic and other related information in road administration.
- To reduce travelling time.
- To prepare various thematic maps.
- To find paths /routes/places for laying eco-friendly ring road.
- To reduce the pollution rate in the city.

III. Study Area - Erode City

Erode is a city, a municipal corporation and the headquarters of Erode district in the South Indian state of Tamil Nadu. It is situated at the centre of the South Indian Peninsula, about 400 kilometres (249 mi) southwest from the state capital Chennai and on the banks of the rivers Cauvery and Bhavani, between 11° 19.5" and 11° 81.05"

North latitude and $77^{\circ} 42.5''$ and $77^{\circ} 44.5''$ East longitude. As per Census 2011 alignments. It has population around 156,953. Erode Local planning Area extends up to 54sq.km. Within the city, and will be extended to 109 km². The roadway connects all the parts of the state and nearby states such as Kerala, Karnataka and Andhra Pradesh with the city. The City has both local (City) and mofussil (city-to-city) bus services with connections to nearby towns and villages. Plenty of city buses are ply to connect all parts of the city. One can get buses from Erode to almost any part of the state. NH connecting Salem – Coimbatore – Cochin passes through Erode and Bypasses the city via Bhavani (Lakshminagar by-pass), Chithode, Perundurai, which is the major National Highway connectivity for the city. SH 79 connecting Rasipuram - Tiruchengode - Pallipalayam – Erode. SH-15 connecting Erode – Gobi – Sathy – Ooty. NH-67A connecting Karur – Erode – Sathy – Mysore. Another planned from Erode (Bhavani) – Anthiyur – Bangalore. Figure.1 shows the study area details.

IV. Data Base Generation

4.1 DATA COLLECTION

Survey of India Toposheet No. 58 E /12

4.2 LAND SAT (MSS) DATA 2007

Maps, field work and remote sensing techniques are necessary for proposed road design and construction. Topographic maps, geomorphology, Land use/Land Cover, Drainage, DEM, road, Slope and Contour maps were used for this proposed route. The favorable path analysis, using various data and GIS analysis, was intended to confirm the best transport route within this site.

4.3 DATA PROCESS AND ANALYSIS

In this implementation, the best route is found for a new road. The steps to find possible path are outlined below. Path is identified by using ArcGIS 9.1 Spatial Analysis Module.

Create Source, Destination and Datasets

Generate different Thematic Maps (Classify and Weight age)

Perform Weighted Distance

Create Direction Datasets

Identified Shortest Path with Distance and Direction Datasets

Figure.2 shows Satellite Image For Erode

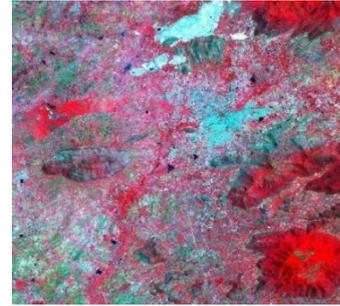

FIGURE.2 SATELLITE IMAGE FOR ERODE

V. Design Guide Lines

5.1 PLANNING OF ROAD IN PLAIN AREAS

Planning of roads in plain area is somewhat different from hill areas. In hill areas alignment of roads has to be circuitous and is primarily governed by the topography. In the plain area we should find the elevation and depression by the survey. The elevation areas should be leveled by removing the upper surface of the earth and this soil can be used for filling up the low lying areas. The roads in our country in plain areas, they have been classified as National Highways, State Highways, Major District Roads, Other District Roads and Village Roads according to specification, traffic needs, and socio-economic, administrative or strategic consideration. Some National Highways are point to point which will connect the state boundaries. State Highways will connect all the National Highways. Major District roads will connect all the State Highways. Other District Roads and Village Roads will connect the Major District Roads however from topographical considerations; these can be broadly divided into arterial roads and link roads. Arterial roads will include national/state highways and major district roads. Link roads take off from arterial roads to link villages/production areas in small/sub-valleys. These will comprise other district roads and village roads.

5.2 HIGHWAY ALIGNMENT

The position or layout of the centre line of the highway on the ground is called alignment. In general the alignment is of two types,

- Horizontal alignment
- Vertical alignment

5.2.1 Requirements

The basic requirements of ideal alignments between two terminal stations are

- Short – A straight line alignment would be the, though there may be several practical considerations which would cause the deviation from the shortest path.
- Easy – The alignment should be such that it is easy to construct and maintain with minimum problems.
- Safe – The alignment should be safe enough for construction and maintenance from the view point of stability of natural hill slopes, embankments, cut slopes.
- Economical – The alignment is considered economical only if the total cost including the initial cost, maintenance cost.

5.2.2 Factors controlling alignment

For an alignment to be shortest, it should be straight between two terminals which are not always possible due to practical difficulties such as intermediate obstructions and topography. A shortest route may have very steep gradients and hence not easy for operations. Similarly there will be construction and maintenance problems along the route which may be otherwise short and easy. Canals are often deviated from the shortest route in order to cater for intermediate places of importance or obligatory points.

5.2.3 Obligatory points

These are control points governing the alignment of a canal. These control points may be broadly divided into two categories,

- Points through which the alignment is to pass.
- Points through which alignment should not pass.

Obligatory points through which alignment has to pass may cause alignment to often deviate from the shortest or easiest path.

5.2.4 Geometric design

Geometric design factors gradient, radius of curvature govern the final alignment. As far as possible while aligning a canal, the gradient should be gradually increasing. It may be necessary to make adjustments in horizontal alignment of canal keeping in view the minimum radius of curvature and the gradient.

5.2.5 Slope stability

While aligning canal, special care should be taken to align along the side of the hill which is stable. A problem in doing this is that of the landslides. The cutting and filling to construct the canal on the hill side causes steepening of existing slopes and effects its stability

5.2.6 Engineering surveys for Highway Alignment

Before canal alignment, engineering surveys are to be carried out. The surveys may be completed in four stages; first three stages consider all possible alternate alignment keeping in

view the various requirements. Four stages of engineering surveys are,

- Map study
- Reconnaissance
- Preliminary survey
- Final location and detailed survey

5.2.7 Horizontal Alignment

The horizontal alignment should be fluent and blend well with the surrounding topography. The horizontal alignment should be co-ordinate carefully with the longitudinal profile. Breaks in horizontal alignments at cross drainage structure and sharp curves at the end of long tangents/straight sections should be avoided. Short curves gives appearance of kinks, particularly for small deflections angles should be avoided. The curves should be sufficiently long and have suitable transitions to provide pleasing appearances. Curve length should be at least 150m for a deflection angle of 5 degrees and this should be increased by 30m for each degree deflection angle. Reverse curves may be needed in difficult t

errain by very sparingly used. It should be ensured that there is sufficient length between the two curves for introduction of requisite curves. Curves in same direction separated by short tangents, known as broken back curves, should be avoided as far as possible in the interest of aesthetics and replaced by a single curve.

5.2.8 Minimum Curve Radii

On a horizontal, the centrifugal force is balanced by the combined effect of super elevation and side friction. Basic equation for this condition of equilibrium is as follows:

$$v^2/g R=e + f$$

$$R=v^2/127(e + f)$$

Where v = vehicle speed in meter/second

V = vehicle speed in km/hr

g = acceleration due to gravity in meter/s²

e = super elevation in meter

f = coefficient of side friction between vehicle type and pavements (taken as 0.15)

r = radius in meter

5.2.9 Vertical Alignment

Broken back grade lines, i.e. two vertical curves in the same direction separated by a short tangent, should be avoided due to poor appearance, and preferably replaced by a single curve. Decks of small cross drainage structures should follow the same profile as the flanking road section with no break in the grade line.

5.2.10 Co-ordination of Horizontal and Vertical Alignment

The overall appearance of a highway can be enhanced considerably by judicious combination of horizontal and vertical alignment. Plan and profile of the road should not be designed independently but in unison so as to produce appropriate three dimensional effect.

VI. Methodology

The base (study area) map, Drainage, Slope and Contour maps were prepared with help of SOI Toposheet (on 1:50,000 scale). High resolution LANSAT satellite data of 2007 was used and by using Digital Image Processing techniques the following thematic maps such as geomorphology, Land use / Land Cover were generated. The Digital Elevation Model (DEM) was generated using various GIS based analysis, such as overlay, raster network analysis. The DEM is used in order to understand the terrain condition, environmental factors and social economic status in this study area. Finally, possible / feasible route was identified based on various physical and cultural parameters and their inherent properties. The cost reduction analysis was also done for substantiating the formation of ring road. Figure.3. Shows the flow diagram.

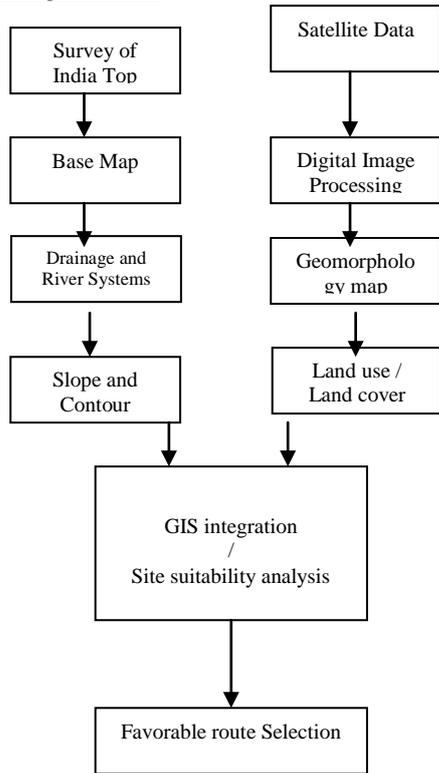

FIGURE.3 FLOW DIAGRAM

VII. TOPOGRAPHY

Topographic and geologic data of the proposed road network area were prepared in a GIS ready format and used as input to the GIS database. The locations of roads, railways, wetland, forests and drainage features were derived from the topographic map layer. The map that produced by SOI is the base for national topographic database and has a number of features for instance location of roads, railways ,wetland ,forests , drainage features, elevation points (Figure. 4). In this proposed project, digital elevation model (DEM) was prepared from the elevation data. It was used as input to the least cost and shortest pathway analysis.

VIII. Geomorphology

Different landforms present in the area are depicted in Figure.5. This geomorphic unit were extracted from the satellite image by digital data interpretation and incorporated into the GIS database. These geomorphic units were classified into Plateau, Scarp face, Debris slope, bazada, residual hill and pediments (deep, shallow & moderate).

FIGURE.4 TOPOSHEET 58 E/12

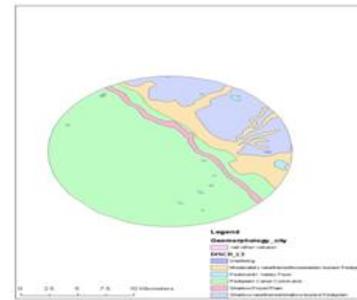

FIGURE.5 GEOMORPHOLOGY MAP

IX. DRAINAGE PATTERN

Erode district is drained by Cauvery and Ponnaiyar river basin. The Cauvery River forms the western and south-western boundary of the district. The domestic and industrial usage of water is being satisfied by Cauvery river water. As far as the drainage fabrication of the study area is concerned, it is covered by third order and fifth order streams in the North and Northeast part.. These streams are seasonal and become dry during summer season and the main stream which is passing through this area of interest is Thirumanimuttar (Figure.6)

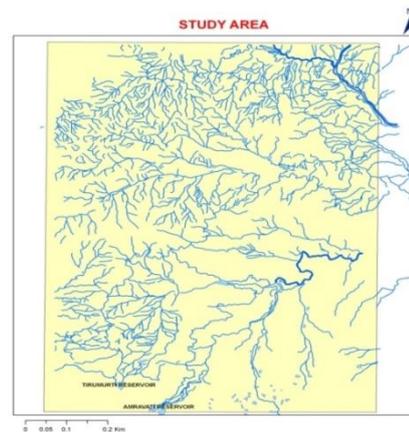

FIGURE.6 DRAINAGE PATTERN

X. LOCATION FOR BRIDGES

In the study area, it is advisable that to construct necessary bridges in the study area where there is crossing of streams that are higher order (more than 3rd order). And the culvert is used for the streams that are lower order (less than 3rd order) (Figure.7).

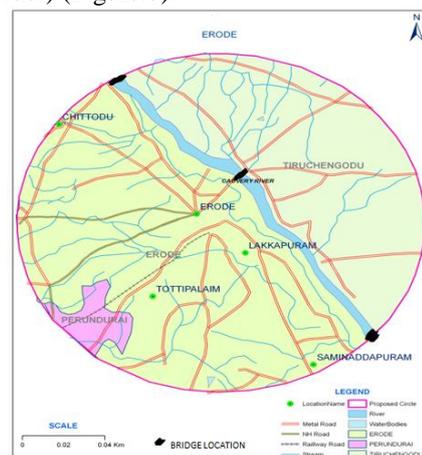

FIGURE.7. LOCATION FOR BRIDGES

XI. LAND USE / LAND COVER

The land use map was prepared from Digital LANDSAT 2007 satellite data and the features were classified as per Integrated Mission for Sustainable Development (NRS, 1995) classification system and following land use patterns were identified as agricultural land, forests, mining area, water body, plantations, barren rock area and urban areas. Most of the area is being occupied by fallow land. Hills/barren rocky area is located in the northern and southern part of the study area. Besides these two major categories, the crop land is also sporadically distributed in the study area. (Figure.8).

FIGURE.8. LAND USE / LAND COVER

XII. OVERVIEW OF SOFTWARE- Arcgis

ArcGIS is a suite consisting of a group of geographic information system (GIS) software products produced by Esri. There are also server-based ArcGIS products, as well as ArcGIS products for PDAs. Extensions can be purchased separately to increase the functionality of ArcGIS.

ArcGIS 8.x

In late 1999, Esri released ArcGIS 8.0, which ran on the Microsoft Windows operating system. ArcGIS combined the visual user-interface aspect of ArcView GIS 3.x interface with some of the power from the Arc/INFO version 7.2 workstation. This pairing resulted in a new software suite called ArcGIS, which included the command-line ArcInfo workstation (v8.0) and a new graphical user interface application called ArcMap (v8.0) incorporating some of the functionality of ArcInfo with a more intuitive interface, as well as an ArcGIS file management application called ArcCatalog (v8.0). The release of the ArcGIS suite constituted a major change in Esri's software offerings, aligning all their client and server products under one software architecture known as ArcGIS, developed using Microsoft Windows COM standards. One major difference is the programming (scripting) languages available to customize or extend the software to suit particular user needs.

In the transition to ArcGIS, Esri dropped support of its application-specific scripting languages, Avenue and the ARC MacroLanguage (AML), in favor of Visual Basic for Applications scripting and open access to ArcGIS components using the Microsoft COM standards. ArcGIS is designed to store data in a proprietary RDBMS format, known as geodatabase. ArcGIS 8.x introduced other new

features, including on-the-fly map projections, and annotation in the database. Updates of ArcView 3.x extensions, including 3D Analyst and Spatial Analyst, came later with release of ArcGIS 8.1, which was unveiled at the Esri International User Conference in 2000.

XIII. CONCLUSION

The purpose of this study was to develop a tool to locate a suitable less route between two points. The GIS approach using ground parameters and spatial analysis provided to

FIGURE.9 FINAL RING ROAD FOR ERODE CITY

achieve this goal. Raster based map analysis provide a wealth of capabilities for incorporating terrain information surrounding linear infrastructure. Costs resulting from terrain, geomorphology, land use, drainage and elevation resulting low cost estimation for implementing the shortest routes for the study area. The Figure.9 shows the final ring road for Erode city of 22 kms all around which connect the major roads of bypass.

Study of a Parabolic Leaf Spring by Finite Element Method & Design of Experiments

Manas Patnaik¹, Narendra Yadav², Ritesh Dewangan³,

^{1,2,3}(Department of Mechanical Engineering, Rungta College of Engineering & Technology, Raipur-492001-India)

Abstract : This work is carried out on a mono parabolic leaf spring of a mini loader truck, which has a loading capacity of 1 Tonnes. The modelling of the leaf spring has been done in CATIA V5 R20. And for finite element analysis the model was imported in the static structural analysis workbench of CATIA V5 R20. The finite element analysis of the leaf spring has been carried out by initially discretising the model and then applying the relevant boundary conditions. Max Von Mises stress and Max Displacement are the output parameters of this analysis. In order to study the behaviour of parabolic leaf spring, Design of experiments has been implemented. In DOE, input parameters such as Eye Distance & Depth of camber have been varied and their affect on output parameters have been plotted.

Keywords: Computer Aided Design (CAD), Camber, Design of Experiments (DOE), Eye Distance, Finite Element Analysis (FEA), Parabolic Leaf Spring (PLS).

I. INTRODUCTION

Parabolic Leaf springs are essential suspension elements used on mini loader trucks necessary to minimize the vertical vibrations, impacts and bumps due to road irregularities and to ensure safety of the loaded cargo. Parabolic Leaf springs are widely used for automobiles. The Parabolic leaf spring absorbs the vertical vibrations and impacts due to road irregularities by means of variations in the spring deflection so that the potential energy is stored in spring as strain energy and then gradually released to maintain comfort. The finite element analysis (FEA) is a computing technique that is used to obtain approximate solutions to the boundary value problems in engineering. It uses a numerical technique called the finite element method (FEM). It is now accepted by major industries across the world and a company that is able to verify a proposed design will be able to perform to the clients specifications prior to manufacturing or construction. In the present work, leaf spring has been analyzed for static strength and deflection using 3D finite element analysis. CATIA V5 R20 has been utilized in the creation of the three dimensional model and its static structural workbench for analysis when subjected to vertical loads. The variation of bending stress and displacement values are computed. To add on the different combinations of input parameters (camber & eye distance) have been taken into account & its influence on bending stress and max deflection has been studied.

II. Parabolic Leaf Spring & Dimensions

A more modern implementation of old leaf springs is the parabolic leaf spring for automobiles. The new innovative design is characterized by the use of less leaves whose thickness varies from the center to the outer side

following a parabolic pattern. The mathematical equation between the thickness & the length of the spring is that of a parabola & hence it has been named as parabolic leaf spring. This results in less inter leaf friction, because of which the only contact point between the springs in vehicle is at the end and the center where the axle is connected. Spacers used in the new design prevent the other parts collisions. Besides being less in weight the main benefit of parabolic springs is their greater flexibility, which is translated as a high ride quality of the vehicle. It gives us the high ride quality which refers to the high degree of safety to the riders from the uneven road and gives high level of comfort.

Modified version of leaf springs is the parabolic leaf springs for automobiles and has better load bearing capacity with less weight. Other benefits include improved fuel economy, load carrying capacity & enhanced suspension.

In the present work parabolic leaf spring of a mini loader truck is considered for analysis. The modeling of the PLS has been carried out in CATIA V5 R20 and has the following dimensions:

1. Camber – 90.81mm
2. Distance between eyes(Eye Distance) : 1025mm
3. Thickness at the central part : 10.81mm

Note: The above dimensions have been taken with the help of an inextensible measuring tape and a vernier caliper and then the procedure of modeling the spring was initiated. The basic views of the considered parabolic leaf spring are shown in fig. 1.

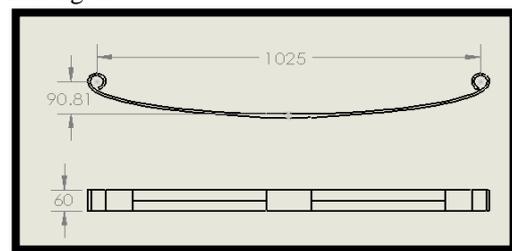

Fig.1 Front & Top view
Note : All dimensions are in mm

III. EXISTING MATERIAL

The material used for experimentation is EN45 and its mechanical properties has been mentioned in Table-1

Table--1

Material		Young's Modulus (E) Gpa	Poisson's Ratio (M)	Density (Kg/M ³)	Yield Strength (Mpa)
EN	IS(Old)				
EN45	55Si2 Mn90	200	0.3	7850	1500

IV. Result And Analysis Using Method Of Finite Elements

1.1 Meshing

Meshing is basically the process of breaking the CAD model into very small elements. It is also known as piecewise approximation. Meshing are of different types, it may be comprising of 1D, 2D or 3D elements. In present case selected is shown in Table-2

Table--2

Mesh			Element type	
S. N.	Entity	Size	Connectivity	Statistics
1	Nodes	12084	Connectivity	Statistics
2	Elements	5905	TE10(Tetrahedron element)	5905 (100.00 %)

1.2 Boundary Conditions

As shown in Fig. 2, one eye of the leaf spring will be fixed and the other eye will have certain degree of rotation to allow the leaf spring to deflect by some amount. It has been mathematically calculated that the maximum load which the spring will be subjected to 3800 N. This particular calculation has been done on the basis of GVW (Gross Vehicle Weight), which may be defined as the total weight of the loaded vehicle. This includes the vehicle itself and the cargo that is loaded within that vehicle.

In order to perform static structural analysis it is very essential to restraint the CAD model in the same manner as it is done physically. As far as parabolic leaf springs are concerned it has two eye ends, one of which is fixed with the upper body of the mini loader truck, while the other end is attached to a shackle which allows the spring to expand along its leaf span thereby causing some degree of rotation in the shackle.

Similarly we have applied constraints to our CAD model of parabolic leaf spring shown in Fig. 3 & 4.

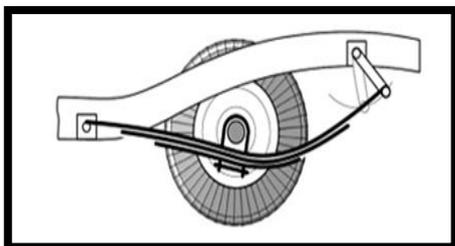

Fig.2 Suspension and Constraints

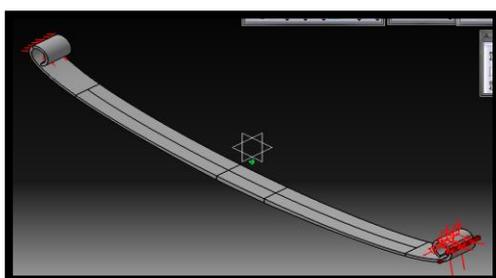

Fig.3 Applying Constraints.

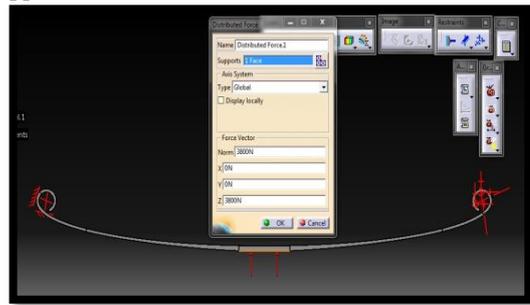

Fig.4 Applying Load

As shown in Fig. 4, the leaf spring is being treated as a simply supported beam which has a central load of 3800 N directed upwards.

4.3 Static Structural Analysis in CATIA V5 R20

After applying the boundary conditions the maximum von mises stress and maximum displacement is shown in Fig. 5 & 6.

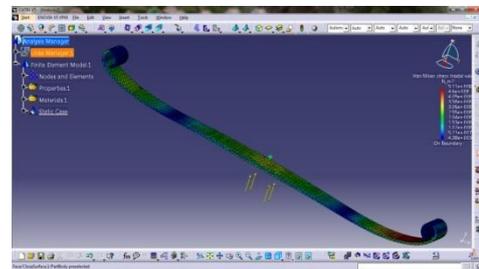

Fig.5 Von Mises Stress

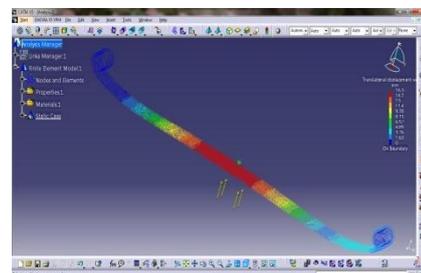

Fig.6 Displacement

Outputs on the basis of existing dimensions has been mentioned in Table-3 :

Table--3

S.N.	Output Parameter	Value
1	Maximum Displacement	16.3079mm
2	Maximum Von mises stress	5.11017e+008 N_m2
3	Energy	30.008 J
4	Mass	4.549kg

V. DESIGN OF EXPIREMENTS

The Design of experiments (DOE) is a tool for determining the significance of different factors affecting process quality and for calculating optimal settings for controllable factors. For example we may believe that operating temperature and wave height affects the number of defects from a wave solder machine. DOE provides a fast & efficient means for determining the values of these parameters that would produce the fewer number of defects. DOE Procedure:

- Select factors to be tested & a measure of process outcome.
- Select test setting for each factor.
- Select the appropriate orthogonal array.
- Run the tests.
- Analyze the results.
- Calculate optimum setting for each factor.
- Run confirmation test(s).

In this work camber and eye distance are selected as input parameters and max displacement, max von mises stress as output parameters. Design of experiments has been implemented by varying camber from 90 mm to 95 mm in steps of 10 and by varying eye distance from 1020 mm to 1030 mm in steps of 10. After running design of experiments the graphs between input and output parameters has been plotted which is shown in Fig.9, 10, 11 and 12.

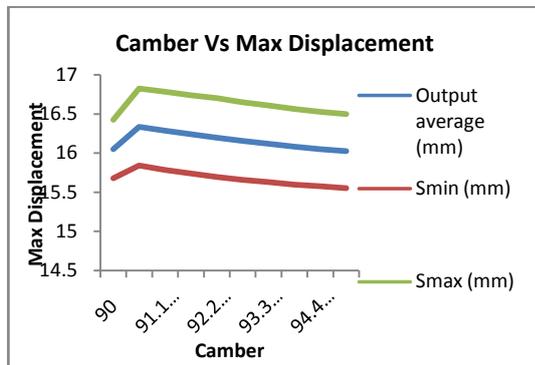

Fig.9 Effect of varying camber on Displacement

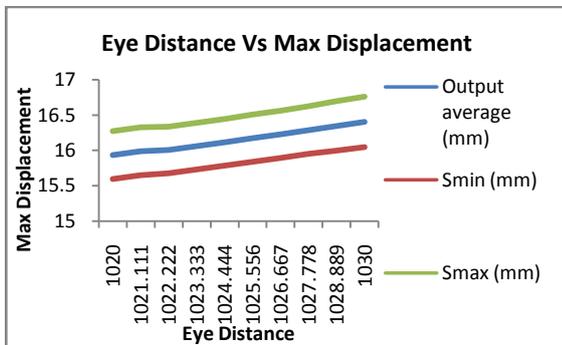

Fig.10 Effect of varying eye distance on displacement

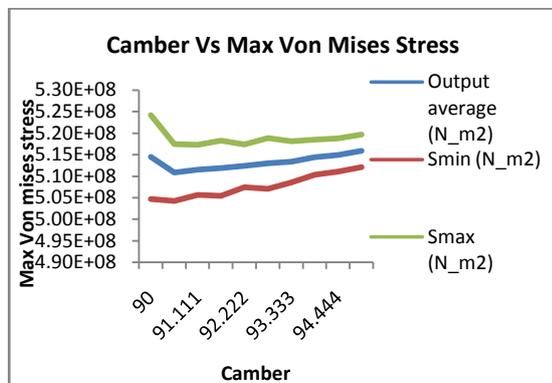

Fig.11 Effect of varying camber on von mises stress

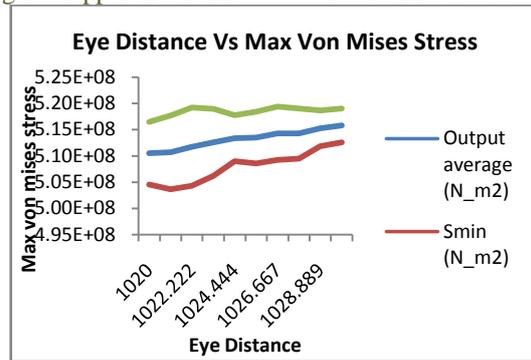

Fig.12 Effect of varying eye distance on Von mises stress

VI. CONCLUSION

After performing the design of experiments the following observations have been made:

- With reference to fig.9, as the camber is increased there is a decrease in the average amount of displacement.
- With reference to fig. 10, if the eye distance is increased there is an increase in the average amount of displacement.
- With reference to fig. 11, if the camber is increased there is an increase in the average amount of von mises stress.
- With reference to fig. 12, if the eye distance is increased there is an increase in the average amount on mises stress.

Hence it is conclude that the optimum setting of dimensions pertaining to parabolic leaf spring can be achieved by studying the various plots obtained from Design of Experiments.

Oofp: Mapping the Oose Models into Function Points: Rules, Tool and Case Study

¹Durga Gehlot, ²Prof. Meena Sharma

¹Department of Computer Engineering, Institute of Engineering and Technology, DAVV Indore, India

²HOD of Computer Engineering, Institute of Engineering and Technology, DAVV Indore, India

Abstract: Function point analysis is useful to measure size of software projects in terms of functionality requested by user. The main advantage of function point analysis is that it is independent of the technology used for implementation. When we apply function points to object-oriented software projects, the concepts of development method have to be mapped into abstract models that contain functional items of the application. This proposed idea implement a tool for mapping function points into use case driven OOSE (object-oriented software engineering) Jacobson approach. In this idea we only considers analysis phase of OOSE life cycle. OOFP tool measures function point from requirements models and analysis model.

Keyword: function points, size, requirements model, and analysis model, OOFP.

I. INTRODUCTION

Function Points Analysis (FPA) is one of the earliest models that are used to predict the size of software in the early stages. Albrecht proposed the FPA model in 1979 and it measures the size of software based on its functionalities [1]. The main advantages of the FPA model are that it is independent of the technology. Up to the present, various FPA versions based on the Albrecht's version have been proposed (e.g. IFPUG method, MarkII, COSMIC-FFP and they have been accepted as ISO/IEC standards. The current version of counting rules is recorded in the Counting Practices Manual [2]. This counting method is implicitly based on the high-level model of software applications. Though independent of implementation, counting rules are thus based on the implicit assumptions on the abstract model of software applications. The items in the abstract model that are then counted include transaction and file types. These items are typically identified from documents of traditional, structured design technique e.g. data flow diagrams, hierarchical process models or database structures. The proposed paper focus on object oriented models based on the OOSE Jacobson approach. The transaction and file type items are counted from models of analysis phase. The models of analysis phase of OOSE includes use case model, domain object model and analysis model but this research paper focuses on counting function points from analysis model and use case model.

1.1 Function Point Analysis with object – oriented design methods

The Function Point software measure does not require a particular development technique. However, the high level concepts of object-oriented development methods cannot be mapped directly to the concepts of Function Point Analysis. In order to apply this software measure early in the development process, the object-oriented concepts corresponding to transactional and data function types have to be determined.

Object-oriented methods differ, especially in their early development phases. The Object-Oriented method of Jacobson et al. is based on so-called use cases. The OO-Jacobson identifies the functionality of an application with requirements use case model. Data types are described with domain or analysis object model on the requirements level. The work proposes rules to map these models into function point counting procedures. With proposed rules, it is possible to count software developed with the OO-Jacobson method.

In this research paper, we focus on the approach of Jacobson et al [3]. This method is called Object-Oriented Software Engineering. The OOSE method defines a process to transform formalized requirements into a sequence of models. The steps include the requirements, analysis, design, implementation and testing models. The use case model is the basis on which all the models are developed. Together with the domain object model it forms requirements model as shown in Figure 1.

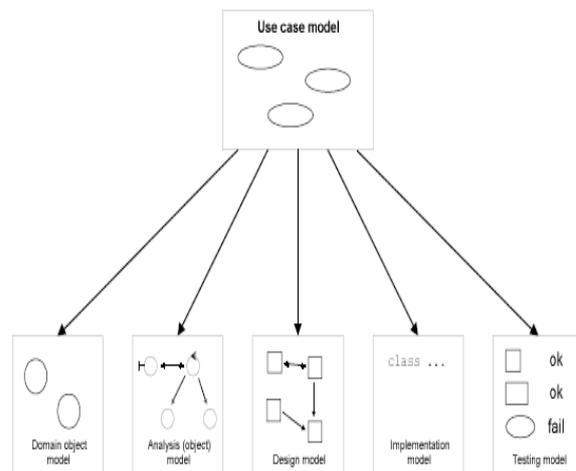

Figure 1: The use case model is the basis on which all other models of OOSE approach are developed.

The objectives of this research paper are:

1. The application of Function Point Analysis following the IFPUG standards.
2. To measure for software developed with OOSE method.
3. To count early in the life cycle, in the requirements analysis phase.

1.2 Related Work

Little work has been published on Function Point Analysis in the context of object-oriented software engineering techniques. But these approaches are based on a model that consists with objects together with their methods. In these approaches objects are treated as data files and methods as transactions which are the counting items in the Function Point Analysis. These approaches do not applicable to early OOSE documents. It is also questionable whether each individual method is to be counted as a transaction.

Whitmire[4] considers each class as an internal logical file and treats messages sent outside the system boundary as transactions.

The ASMA paper takes a similar approach. Services delivered by objects to the client are considered as transactions. The complexity of services is weighted based on accessed attributes and communications. Objects are treated as files, their attributes determining their complexity.

IFPUG [5] is working on a case study which illustrates the use of the counting practices for object-oriented analysis and design. This case study, which is currently in draft form, uses object models in which the methods of classes are identical with the services recorded in the requirements. Under this assumption, the methods can be counted as transactions.

Karner [6] proposes a new measure called Use Case Points for projects developed with the OOSE method. The structure of this measure is similar to Function Points, but it does not conform to the concepts of Function Points.

Thomas Fetcke[7] proposes rules for mapping the OO-Jacobson approach into Function Point Analysis. This paper is based on Thomas proposed rules. This research paper considers how to apply these rules to OOSE models to measure data and transaction functions. In this paper data files and transaction functions counting is done using models of analysis phase of the OOSE life cycle. Analysis phase model includes use case model and analysis model.

II. Brief Introduction To Oose

The OOSE method is divided into three major consecutive processes: analysis, constructive and testing. The analysis phase is further divided into two steps called requirements analysis and robustness analysis as shown in Figure 2. The first step derives the requirements model from the informal customer requirements. This model is expressed in terms of use case model, and may be augmented by a domain object model. The second step, robustness analysis, then structures the use case model into the analysis model by applying use case analysis. The succeeding process further transforms these models, as indicated in Figure 1.

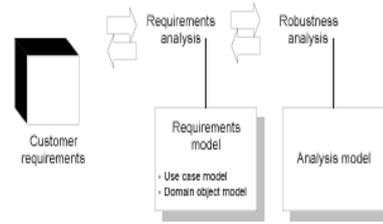

Figure 2: Analysis Phase of the OOSE life cycle.

At the focus of our work are the models developed in analysis phase as shown in Figure2. As Jacobson et al. state, the requirements model can be regarded as formulating the functional requirements specification based on the needs of the users. The goal of this research paper work is to count Function Points early in the life cycle, measuring the functionality requested by the user from these models. The overview of these three models discussed in [7].

III. Fuction Point Concepts

3.1 Function Point model

A high level model of the FPA mode is given in Figure 3 [7]. The function Point model specifies which component types of the software application will be measured and from which viewpoint this will be done. What is to be counted, and measured, are the internal files and external files of the application, together with the inputs, outputs and inquiries from and to the user. Software components or deliverables which are not visible from a user viewpoint are not considered part of the Function Point measurement model.

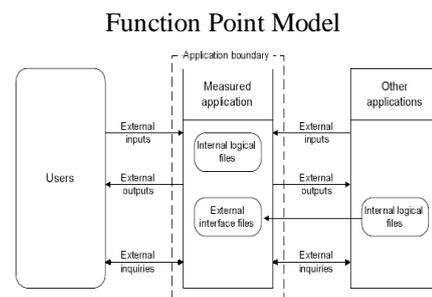

Figure 3: High-level view of the abstract Function Point model with users and links to other applications. The dotted line marks the application boundary.

3.2 Function Point Counting Process

In the IFPUG version, the counting procedure of function point consists of the following seven steps. The details of these seven steps are discussed in IFPUG [2].

1. Determine type of function point count.
2. Identify the application boundary (A boundary indicates the border between the application or project being measured and the external applications or the user domain. A boundary establishes which functions are included in the function point count).
3. Identify and rate transactional function types to determine their contribution to the unadjusted function point count.
4. Identify and rate data function types to determine their contribution to the unadjusted function point count.

5. Determine the Unadjusted function point counts.
 6. Determine the value adjustment factor (VAF) that takes so-called global system characteristics into account, e.g. data communication, performance or end user efficiency. This adjustment is external of and independent from the concepts of the abstract FPA model. The global system characteristics determine an adjustment factor that is multiplied with the unadjusted count.
 7. Calculate the adjusted function point count.
- The next section describes the proposed mapping of OOSE models to function points along these five steps.

IV. Mapping Concepts (Proposed Method)

The aim of this research paper is to calculate the Unadjusted Function Point. The paper work proposes the following five steps to apply IFPUG version to the OOSE requirements analysis models (use case model and analysis model).

- 4.1 **Step1**(Determine the type of function count): This paper handles only the application project function point.
- 4.2 **Step2**(Identify the application boundary): The counting boundary is determined by the type of actors appeared in use case model of OOSE requirement analysis phase.

Proposed mapping rules to identify the application boundary

1. Accept each human actor as a *user* of the system.
2. Accept each non-human actor, which is separate system not design to provide functionality solely to the system under consideration as an *external application*.
3. Reject each non-human actor, which is part of the underlying system, e.g. a rational database system or a printing device.

The result is a representation of the application boundary as a set of users and applications external to the one under consideration as shown in Figure 4.

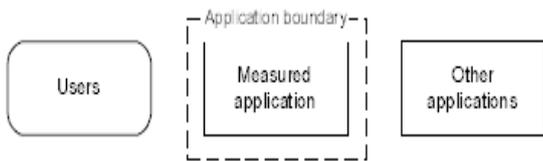

Figure 4: Step2- Identification of the counting boundary.

4.3 **Step3** (Identify and rate transactional function types to determine their contribution to the unadjusted Function point count.):

The transaction functions are automatically decided based on actors and use cases of the use case model. Use cases are the OOSE concept corresponding to transactions.

Proposed mapping rules to identify and rate transaction function types

4. Select every use case that has a direct relation to an actor accepted by rule 1 or 2. This use case will be a candidate for one or several transactions.

5. Select every use case that extends a use case selected by rule 4 as a candidate.
 6. No other use cases will be counted.
- Determining the types of transaction (external input (EI), external output (EO) and external inquiry (EQ) is based on a set of detailed rules in FPA [1]. The rules are recorded in the IFPUG Counting Practices Manual [2]. The relevant sections are:
 “External Input Counting Rules”,
 “External Output Counting Rules”, and
 “External Inquiry Counting Rules”.

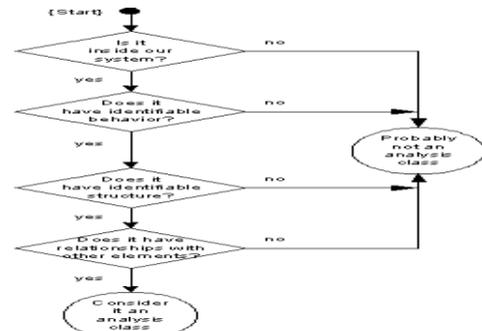

The rates of transactions are based on detailed rules in the counting practices Manual. The rules require the determination of data element types (DET) and file types that are referenced (FTR), illustrated in Figure 5

4.4 **Step4** (Identify and rate data function types to determine their contribution to the unadjusted function point count.):

Data files are automatically decided based on analysis classes of analysis model. In the analysis model, the objects are typed into three groups, namely entity, interface and control objects. The set of objects that have to be analyzed is limited to the entity objects and is thus set of objects typically smaller. Interface (boundary) and control objects are part of implementation.

4.4.1 Finding of Analysis Classes from Use Case Model

1. Is this candidate inside our system boundary?
 2. If not, it might be an actor of our system.
 Does this candidate have identifiable behavior for our problem domain? (i.e., can we name the services/functions that are needed in our problem domain and that this candidate would own and provide?)
3. Does this candidate have identifiable structure? (i.e., can we identify some set of data this candidate should own and manage?)
4. Does this candidate have relationships with any other candidates?

If you find a "no," then the candidate is probably not a class; move on to the next candidate. If the answer is "yes," keep asking the questions. If you get all "yes" answers, conclude the candidate is a class, and get the next candidate to evaluate.

Proposed mapping rules to identify and rate data function types

7. Select every object of entity type as a candidate for a logical file.
8. No other objects will be selected.

For aggregation relationships

9. An entity objects that is part of another object (is aggregated into another object) is not a candidate for a logical file, but it is a candidate for a record element type (RET) for the file related to the aggregating top-level object

For inheritance relationships

10. An abstract object is not a candidate for a logical file. It is a candidate for a RET for each object that inherits its properties.
11. Sub-objects of a concrete object are candidates for a logical file or for a RET of that object.
12. If use cases make implicit use of logical files that are not represented in the analysis object (class) model, these files have to be included in the set of files.

Determining the types of data files (internal logical files (ILF) and external interface files (EIF)) is based on a set of detailed rules in FPA [1]. The rules are recorded in the IFPUG Counting Practices Manual [2]. The relevant section is “ILF/EIF counting rules”.

The rates of data files are based on detailed rules in the counting practices Manual. The rules require the determination of data element types (DET) and record element types (RET), illustrated in Figure 5.

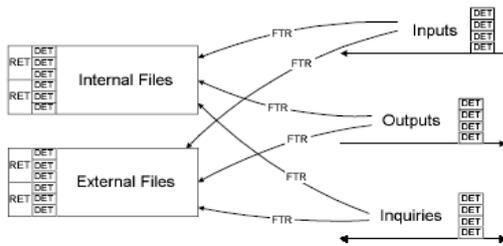

Figure 5: Step3 and Step4- Rating of data and transaction function types.

Proposed Mapping Rules for determining DET, RET and FTR

13. Attributes of objects are candidates for data element types (DET) for files and for the transactions by which it is read and maintained.
14. Candidates for record element types are determined by subgroups of files and by rules 9-11.
15. Each object maintained and /or read by a use case counts as a file type referenced (FTR) for the associated transaction(s), if and only if the object has been identified as a file in step 4.

After determining DETs, RETs, FTRs rate the data files and transaction functions according to rating matrix and then allot weighs according to weighting matrix in the Counting Practices Manual [2]. The total weight of data files types and transaction types are the required unadjusted function points count.

4.5 Step 5 (Determine the unadjusted function point counts)

As the result of Step3 and Step4, the counts for each function type are automatically classified according to complexity and then weighted. The total for all function types is the unadjusted function point count.

V. CASE STUDY

In this section the rules proposed in section 4 are applied to OOSE approach based project. The documentation provided included use case models and analysis object models together with the textual description these models.

5.1 Example of OOSE based analysis models

In OOSE life cycle, analysis phase is divided into two phases: requirement analysis and robustness analysis. Requirement analysis consists with two models, use case models and domain object models. Robustness analysis consists with a model known as analysis model. This research work focuses on use case models and analysis classes.

Case Study: A part of Course Registration System Use Case Model

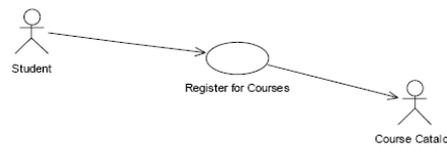

Figure6: Use Case: Register for Courses

This use case allows a Student to register for course offerings in the current semester. The Student can also update or delete course selections if changes are made within add/drop period at the beginning of the semester. The Course Catalog System provides a list of all the course offerings for the current semester.

5.2 Finding Analysis classes from use case model (Behavior)

Register for Courses Use Case-This use case starts when a Student wishes to register for course offerings, or to change his/her existing course schedule.

1. The system requests that the Student specify the function he/she would like to perform (Create a Schedule, Update a Schedule, or Delete a Schedule).
2. Once the Student provides the requested information, one of the sub flows is executed. If the Registrar selected “Create a Schedule”, the Create a Schedule sub flow is executed. If the Registrar selected “Update a Schedule”, the Update a Schedule sub flow is executed. If the Registrar selected “Delete a Schedule”, the Delete a Schedule sub flow is executed.

Candidates for entity (noun) and applying 4 conditions of section 4.4.1 to make them entity analysis classes as shown in Figure7.

1. **Student-**A person enrolled in classes at the university.
2. **Schedule-**The courses a student has selected for the current semester.

3. Course Offering-A specific delivery of the course for a specific semester – you could run the same course in parallel sessions in the semester. Includes the days of the week and times it is offered.

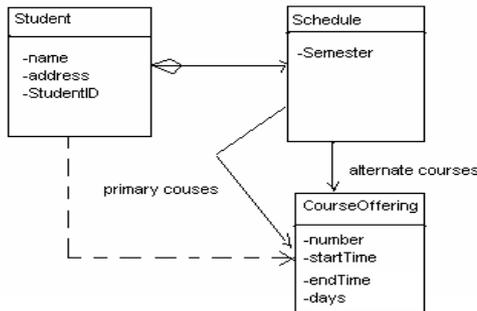

Figure7: Analysis class model consists with entity analysis classes

5.3 Now, applying proposed rules to Analysis Class Model and Use Case Model of above Case Study:

By rules 1, 2 and 3 application boundary includes-
 Human actors- student
 Non-human actors- Nil

By rules 4-12 and 13-15 candidates for transaction/data function types with ratings and weight are shown in Table1.

Transaction/ data function name	Transaction/ data function type	No. of DET	No. of RET/ FTR	Comple xity	Weight/ Value
Register for courses	EI	3	2FTRs (Student, Schedule)	low	3
Register for courses	EO	3	2FTRs (Student, Schedule)	low	3
Register for courses	EQ	4	1FTR (Course Offering)	low	4
Student	ILF	3	1RET(Schedule)	low	7
Course Offering	ILF	4	1RET(Schedule)	low	7
UAFP					24 FPs

Table1: Transaction/Data function types with ratings and weight.

In order to make it adjusted function point, we have to calculate and tabulate the GSC and come out with the VAF as shown in Table2.

GSC	Value (0-5)
Data communications	1
Distributed data processing	1
Performance	4
Heavily used configuration	0
Transaction rate	1
On-Line data entry	0
End-user efficiency	4
On-Line update	0
Complex processing	0
Reusability	3
Installation ease	4
Operational ease	4
Multiple sites	0
Facilitate change	0
Total	22

Table2: Global System Characteristics (GSC)

So using formulae:

$$VAF = 0.65 + ((\text{sum of all GSC factor})/100).$$

$$= 0.65 + (22/100) = 0.87$$

This factor affects the whole FP like anything, be very particular with this factor.

So now, calculating the Adjusted FP (AFP) = VAF * Total Unadjusted FP (UAFP)

$$= 0.87 * 24 = 20.88,$$

=Rounded to 21 FPs

Compared with the approaches proposed in the literature, these mapping rules have certain advantages.

1. The mapping rules are based on the standard FPA defined in the IFPUG Counting Practice Manual. This widely used measure independent of technology.
2. The count is based on requirements models, which are the first models available in the OOSE life cycle. For the purpose of effort estimation based on Function Points, this is an essential prerequisite.

This approach also has some limitations.

1. The main limitation is the focus on the Jacobson OOSE method. Mapping rules are based on the requirements models of this approach and cannot be applied to methods that do not develop these models. Also an advantage this focus on OOSE, that the models are unambiguously defined in the method.

VI. OOFP TOOL

The concept of mapping the object oriented software models into function Points lead to implement a tool called OOFP. This tool is implemented in java language. The inputs for the tool are use case model and analysis class (object) model and the output includes the values of function points, transactional functions, and data functions.

The OOFP tool is automated using XMI (xml metadata interchange) parser. The XMI parser takes .xmi or .xml files of use case and analysis class models as input then read and extracts the use cases, actors, entity classes from these files. Extracted candidates are then used for calculating function points.

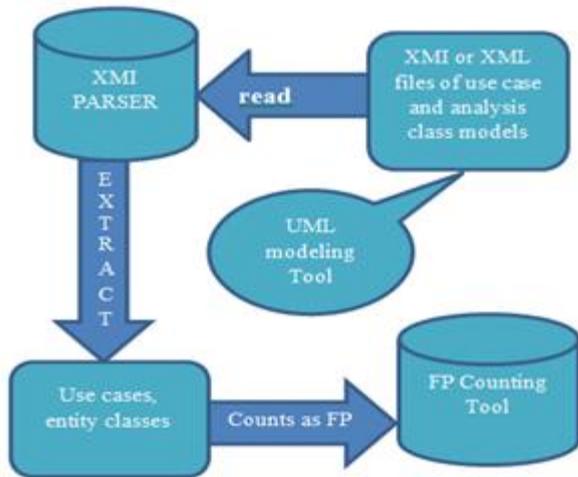

Figure: 8 Function Point Counting Tool (OOFP tool).

VII. SUMMARY

This work demonstrated the applicability of function points as a measure of functional software size to the object-oriented Jacobson approach, OOSE. This work supports that the function point measures independent of the technology used for implementation and that it can be used in the object-oriented paradigm.

Future work in the field has to deal with the mapping of OOSE design model into function points.

Edge Coloring of a Complement Fuzzy Graph

Arindam Dey, Dhrubajyoti Ghosh, Anita Pal

*Departments of Mathematics, National Institute of Technology Durgapur,
Durgapur-713209, West Bengal, India*

ABSTRACT: Graph coloring is one of the most important problems of combinatorial optimization. Many problems of practical interest can be modeled as coloring problems. Two types of coloring namely vertex coloring and edge coloring are usually associated with any graph. Edge coloring is a function which assigns colors to the edges so that incident edges receive different colors. Let $G=(V,\mu,\sigma)$ be a simple connected undirected graph where V is a set of vertices and each vertices has a membership value μ and each edge has a membership value σ . Minimum number of color needed to color the graph is known as chromatic number of that graph. Graph coloring is a NP complete problem. In our paper, we introduce an algorithm to find the complement of any fuzzy graph with $O(n^2)$ time and also coloring this complement fuzzy graph using α cut.

Keywords: Complement fuzzy graph, edge color, α cut of fuzzy graph

I. INTRODUCTION

We know that graphs are simple model of relation. A graph is a convenient way of representing information involving relationship between objects. The object is represented by vertices and relations by edges. When there is vagueness in the description of the objects or in its relationships or in both we need to design fuzzy graph model. One of the most important properties of fuzzy graph model is fuzzy graph coloring which is used to solve problems of combinatorial optimization like traffic light control, exam-scheduling, register allocation etc. Two types of coloring namely vertex coloring and edge coloring are usually associated with any graph. The paper is organized in five sections. 1st section includes introduction of fuzzy graph model. Section two defines fuzzy graph and its properties. Section three, we find the complement of a fuzzy graph and define a coloring function which is based on α cut to color the complement fuzzy graph and finding the chromatic number for this fuzzy graph.

II. FUZZY GRAPH

A fuzzy graph is a pair of functions $G: (\sigma, \mu)$ where σ is a fuzzy subset X and μ is a symmetric relation on σ i.e. $\sigma: X \rightarrow [0, 1]$ and $\mu: X \times X \rightarrow [0, 1]$ such that $\mu(x, y) \leq \sigma(x) \wedge \sigma(y)$ for all x, y in X . we denote the crisp graph of $G: (\sigma, \mu)$ by $G^*: (\sigma^*, \mu^*)$ where σ^* is referred to as the nonempty set X of nodes and $\mu^* = E \in X \times X$. Now crisp graph (X, E) is a special case of a fuzzy graph with each vertex and edge of (X, E) having degree of membership value 1 where loops are not consider and μ is reflexive.

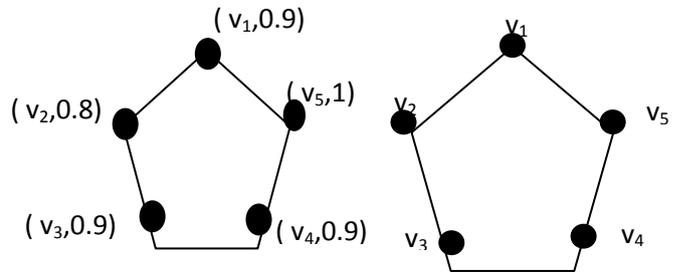

Fig 1 Fuzzy graph (G)

Fig 2 Crisp graph(G^*)

2.1 COMPLEMENT OF FUZZY GRAPH

Complement of a fuzzy graph has been defined by Moderson [1]. Complement of a fuzzy graph $G: (\sigma, \mu)$ as a fuzzy graph $G^c: (\sigma^c, \mu^c)$ where $\sigma^c = \sigma$ and $\mu^c(x, y) = 0$ if $\mu(x, y) > 0$ and $\mu^c(x, y) = \sigma(x) \wedge \sigma(y)$ otherwise. From the definition G^c is a fuzzy graph even if G is not and $(G^c)^c = G$ if and only if G is a strong fuzzy graph. Also, automorphism group of G and G^c are not identical. But there is some drawbacks in the definition of complement of a fuzzy graph mentioned above. In fig 5 $(G^c)^c \neq G$ and note that they are identical provided G is a strong fuzzy graph

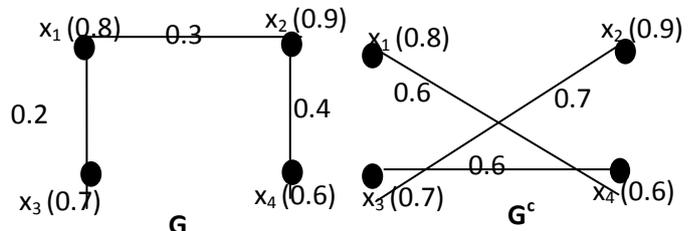

Fig 3 Fuzzy graph

Fig 4 Complement Fuzzy graph

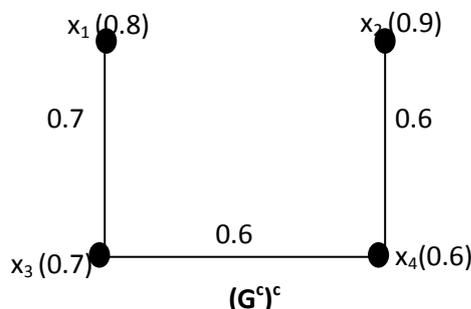

Fig .5 Complement of complement Fuzzy graph

Now the complement of a fuzzy graph $G: (\sigma, \mu)$ is the fuzzy graph $\bar{G}: (\bar{\sigma}, \bar{\mu})$ where $\bar{\sigma} \equiv \sigma$ and $\bar{\mu}(x, y) = \sigma(x) \wedge \sigma(y) - \mu(x, y) \forall x, y \in X$ (1)

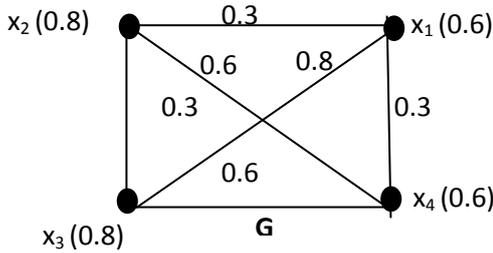

Fig. 6 Fuzzy graph

For solving this problem we have done the calculation into three cases. in 1st case we take a fuzzy graph (G) which have five vertices and five edges. All the vertices and edges have fuzzy membership value. In the second case we find the complement of this fuzzy graph (G₁). In third section we define the edge coloring function to color the complement fuzzy graph.

CASE 1:

We consider a fuzzy graph with have five vertices, v_1, v_2, v_3, v_4, v_5 and corresponding membership values 0.9, 0.75, 0.95, 0.95, 0.9. Graph consist of five edges e_1, e_2, e_3, e_4, e_5 with their corresponding membership value 0.75, 0.9, 0.85, 0.15, 0.6. Corresponding fuzzy graph is shown in fig. 9

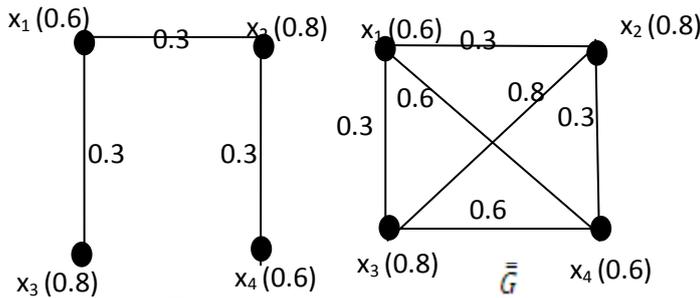

Fig. 7 Complement Fuzzy graph

Fig. 8 Complement of complement Fuzzy graph

$$\mu_1 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0.0 & 0.75 & 0.0 & 0.0 & 0.9 \\ v_2 & 0.75 & 0.6 & 0.0 & 0.0 & 0.0 \\ v_3 & 0.0 & 0.6 & 0.0 & 0.15 & 0.0 \\ v_4 & 0.7 & 0.5 & 0.14 & 0.0 & 0.85 \\ v_5 & 0.5 & 0.6 & 0.85 & 0.5 & 0.9 \end{bmatrix}$$

Adjacent matrix 1

Now, $\bar{\bar{\sigma}} = \bar{\sigma} = \sigma$ and $\bar{\bar{\mu}}(x, y) = \bar{\sigma}(x) \wedge \bar{\sigma}(y) - \bar{\mu}(x, y) = \sigma(x) \wedge \sigma(y) - ((\sigma(x) \wedge \sigma(y) - \mu(x, y))) = \mu(x, y) \forall x, y$. Hence $\bar{\bar{G}} = G$

Fig. 8 shows the Complement of complement fuzzy graph is a fuzzy graph

2.2 α CUT OF A FUZZY GRAPH

α cut set of fuzzy set A is denoted as A_α is made up of members whose membership is not less than α . $A_\alpha = \{x \in X \mid \mu_A(x) \geq \alpha\}$. α cut set of fuzzy set is crisp set. In this paper, α cut set depend on vertex and edge membership value. The α cut of fuzzy graph defined as $G_\alpha = (V_\alpha, E_\alpha)$ where $V_\alpha = \{v \in V \mid \sigma \geq \alpha\}$ and $E_\alpha = \{e \in E \mid \mu \geq \alpha\}$

III. COLORING OF COMPLEMENT FUZZY GRAPH

In our previous paper [8] we have done a C program to find the complement a fuzzy graph using the condition (1). In this paper we find the complement of the fuzzy graph using the C program. We find all the different membership value of vertices and edges in the complement of a fuzzy graph. This membership value will work as a α cut of this complement fuzzy graph. Depend upon the values of α cut we find different types of fuzzy graphs for the same complement fuzzy graph. Then we color all the edges of the complement fuzzy graph so that no incident edges will not get the same color and find the minimum number of color will need to color the complement fuzzy graph is known as chromatic number.

$$E_1 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0 & e_1 & 0 & 0 & e_5 \\ v_2 & e_1 & 0 & e_3 & 0 & 0 \\ v_3 & 0 & e_2 & 0 & e_4 & 0 \\ v_4 & 0 & 0 & e_3 & 0 & e_4 \\ v_5 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Adjacent matrix 2

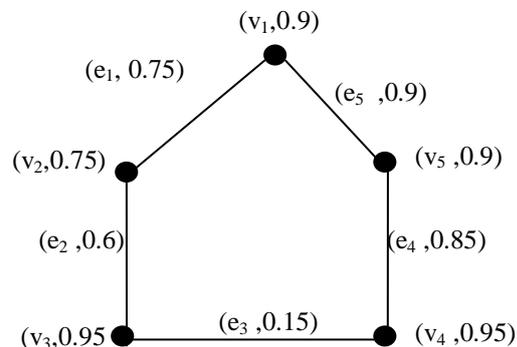

fig.9 G (fuzzy graph)

Adjacent matrix 1 represents the membership value of edges and adjacent matrix2 represents the existence of edges between the vertices

CASE 2:

We find the complement of a fuzzy graph using [8].

For $\alpha = 0.05$ Fuzzy graph $G = (V, \sigma, \mu)$ where $\sigma = \{0.9, 0.75, 0.95, 0.95, 0.9\}$ and

$$\mu_2 = \begin{matrix} & v_1 & v_2 & v_3 & v_4 & v_5 \\ \begin{matrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \end{matrix} & \begin{bmatrix} 0.0 & 0.0 & 0.9 & 0.9 & 0.0 \\ 0.0 & 0.0 & 0.15 & 0.75 & 0.75 \\ 0.9 & 0.15 & 0.0 & 0.0 & 0.9 \\ 0.75 & 0.75 & 0.0 & 0.0 & 0.05 \\ 0.0 & 0.75 & 0.9 & 0.05 & 0.0 \end{bmatrix} \end{matrix}$$

Adjacent matrix 3

$\mu_3 =$

$$\begin{matrix} & v_1 & v_2 & v_3 & v_4 & v_5 \\ \begin{matrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \end{matrix} & \begin{bmatrix} 0.0 & 0.0 & 0.9 & 0.9 & 0.0 \\ 0.0 & 0.0 & 0.15 & 0.75 & 0.75 \\ 0.9 & 0.15 & 0.0 & 0.0 & 0.9 \\ 0.75 & 0.75 & 0.0 & 0.0 & 0.05 \\ 0.0 & 0.75 & 0.9 & 0.05 & 0.0 \end{bmatrix} \end{matrix}$$

Adjacent matrix 5

$$E_2 = \begin{matrix} & v_1 & v_2 & v_3 & v_4 & v_5 \\ \begin{matrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \end{matrix} & \begin{bmatrix} 0 & 0 & e_1 & e_2 & 0 \\ 0 & 0 & e_4 & e_6 & e_3 \\ e_1 & e_4 & 0 & 0 & e_5 \\ e_2 & e_6 & 0 & 0 & e_7 \\ 0 & e_3 & e_5 & e_7 & 0 \end{bmatrix} \end{matrix}$$

$$E_3 = \begin{matrix} & v_1 & v_2 & v_3 & v_4 & v_5 \\ \begin{matrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \end{matrix} & \begin{bmatrix} 0 & 0 & e_1 & e_2 & 0 \\ 0 & 0 & e_4 & e_6 & e_3 \\ e_1 & e_4 & 0 & 0 & e_5 \\ e_2 & e_6 & 0 & 0 & e_7 \\ 0 & e_3 & e_5 & e_7 & 0 \end{bmatrix} \end{matrix}$$

Adjacent matrix 6

Adjacent matrix 4

Adjacent matrix 3 represents the membership value of edges and adjacent matrix 4 represents the existence of edges edge between the vertices

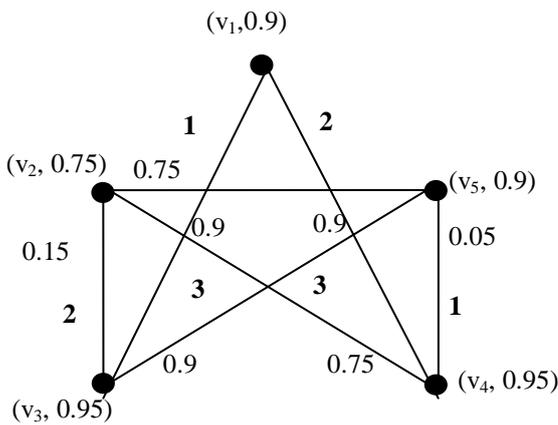

Fig.10 G_1 (complement fuzzy graph)

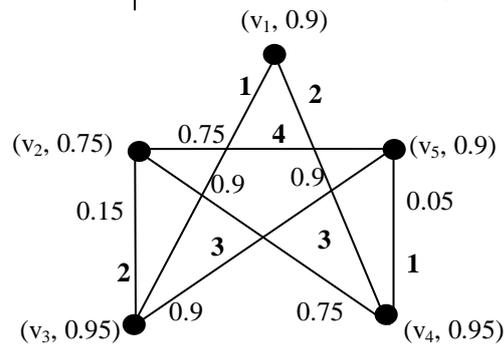

Fig.11 $\chi_{(0.05)} = 4$

For α cut value 0.05 we find the graph $G_{0.05}$ (Fig. 11). Then we proper color all the edges of this graph and find the chromatic number of this graph is 4.

For $\alpha = 0.15$ Fuzzy graph $G = (V, \sigma, \mu)$ where $\sigma = \{0.9, 0.75, 0.95, 0.95, 0.9\}$ and

CASE 3:

Given a fuzzy graph $G=(V_F, E_F)$, its edge chromatic number is fuzzy number $\chi(G)=\{x_\alpha, \alpha\}$ where x_α is the edge chromatic number of G_α and α values are the different membership value of vertex and edge of graph G .

In this fuzzy graph, there are six α cuts. They are $\{0.05, 0.15, 0.75, 0.9, 0.95\}$. For every value of α , we find graph G_α and find its fuzzy edge chromatic number.

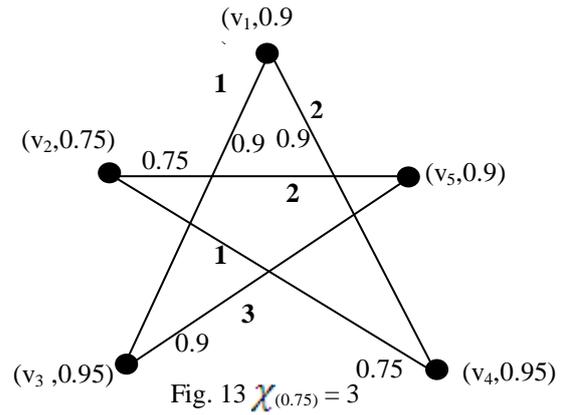

$$\mu_4 = \begin{matrix} & v_1 & v_2 & v_3 & v_4 & v_5 \\ \begin{matrix} v_1 \\ v_2 \\ v_3 \\ v_4 \\ v_5 \end{matrix} & \begin{bmatrix} 0.0 & 0.0 & 0.9 & 0.9 & 0.0 \\ 0.0 & 0.0 & 0.15 & 0.75 & 0.75 \\ 0.9 & 0.15 & 0.0 & 0.0 & 0.9 \\ 0.75 & 0.75 & 0.0 & 0.0 & 0.0 \\ 0.0 & 0.75 & 0.9 & 0.0 & 0.0 \end{bmatrix} \end{matrix}$$

Adjacent matrix 7

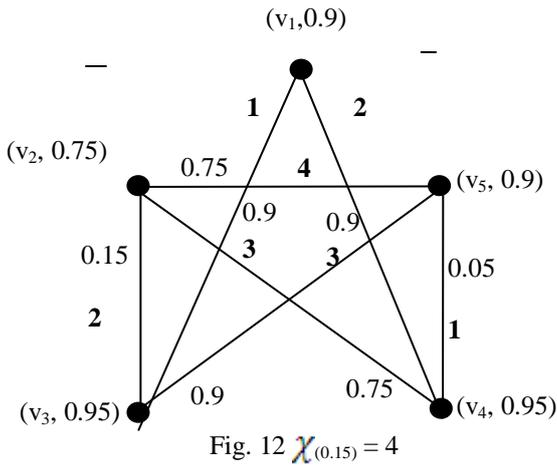

$v_1 \quad v_2 \quad v_3 \quad v_4 \quad v_5$

$$E_4 = \begin{bmatrix} v_1 & 0 & 0 & e_1 & e_2 & 0 \\ v_2 & 0 & 0 & e_4 & e_6 & e_3 \\ v_3 & e_1 & e_4 & 0 & 0 & e_5 \\ v_4 & e_2 & e_6 & 0 & 0 & 0 \\ v_5 & 0 & e_3 & e_5 & 0 & 0 \end{bmatrix}$$

Adjacent matrix 8

Now for α cut value 0.75 we find the graph $G_{0.75}$ (Fig. 13). Then we proper color all the edges of this graph and find the chromatic number of this graph is 3. For $\alpha = 0.9$ Fuzzy graph $G = (V, \sigma, \mu)$ where $\sigma = \{0.9, 0.95, 0.95, 0.9\}$ and

For α cut value 0.15 we find the graph $G_{0.15}$ (Fig. 12). Then we proper color all the edges of this graph and find the chromatic number of this graph is 4. For $\alpha = 0.75$ Fuzzy graph $G = (V, \sigma, \mu)$ where $\sigma = \{0.9, 0.75, 0.95, 0.95, 0.9\}$

$$\mu_6 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0.0 & 0.0 & 0.9 & 0.9 & 0.0 \\ v_2 & 0.0 & 0.0 & 0.0 & 0.0 & 0.0 \\ v_3 & 0.9 & 0.0 & 0.0 & 0.0 & 0.9 \\ v_4 & 0.0 & 0.0 & 0.0 & 0.0 & 0.0 \\ v_5 & 0.0 & 0.0 & 0.9 & 0.0 & 0.0 \end{bmatrix}$$

Adjacent matrix 11

$$\mu_5 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0.0 & 0.0 & 0.9 & 0.9 & 0.0 \\ v_2 & 0.0 & 0.0 & 0.0 & 0.75 & 0.75 \\ v_3 & 0.9 & 0.0 & 0.0 & 0.0 & 0.9 \\ v_4 & 0.75 & 0.75 & 0.0 & 0.0 & 0.0 \\ v_5 & 0.0 & 0.75 & 0.9 & 0.0 & 0.0 \end{bmatrix}$$

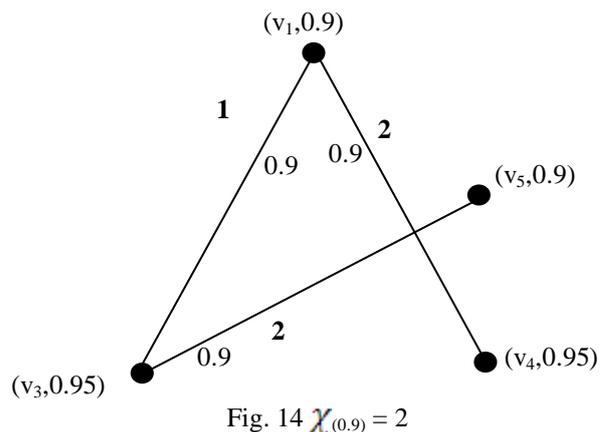

Adjacent matrix 9

$$E_6 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0 & 0 & e_1 & e_2 & 0 \\ v_2 & 0 & 0 & 0 & 0 & 0 \\ v_3 & e_1 & 0 & 0 & 0 & e_5 \\ v_4 & 0 & 0 & 0 & 0 & 0 \\ v_5 & 0 & 0 & e_5 & 0 & 0 \end{bmatrix}$$

Adjacent matrix 12

$$E_5 = \begin{bmatrix} v_1 & v_2 & v_3 & v_4 & v_5 \\ v_1 & 0 & 0 & e_1 & e_2 & 0 \\ v_2 & 0 & 0 & 0 & e_6 & e_3 \\ v_3 & e_1 & 0 & 0 & 0 & e_5 \\ v_4 & e_2 & e_6 & 0 & 0 & 0 \\ v_5 & 0 & e_3 & e_5 & 0 & 0 \end{bmatrix}$$

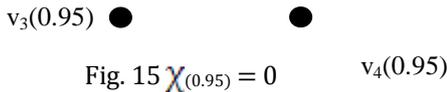

Adjacent matrix 10

For α cut value 0.9 we find the graph $G_{0.9}$ (Fig. 14). Then we proper color all the edges of this graph and find the chromatic number of this graph is 2.

For $\alpha= 0.95$ Fuzzy graph $G = (V, \sigma, \mu)$ where $\sigma = \{0.95\}$ and

$$\mu_{0.95} = \begin{matrix} & v_3 & v_4 \\ \begin{matrix} v_3 \\ v_4 \end{matrix} & \begin{bmatrix} 0.0 & 0.0 \\ 0.0 & 0.0 \end{bmatrix} \end{matrix}$$

For α cut value 0.95 we find the graph $G_{0.95}$ (Fig. 15). Then we proper color all the edges of this graph and find the chromatic number of this graph is 0.

In the above example, five crisp graph $G_\alpha = (V_\alpha, E_\alpha)$ are obtained by considering different values of α . Now for the edge chromatic number χ_α for any α , it can be shown that the chromatic number of fuzzy graph G is $\chi(G) = \{(4, 0.05), (4, 0.15), (3, 0.75), (2, 0.9), (0, 0.95)\}$

IV. CONCLUSION

In this paper we find the complement fuzzy graph and color all the edges of that complement fuzzy graph. Here edge chromatic number depends on α cut value. In our next paper, we shall try to design an algorithm on edge coloring function to any fuzzy graph.

Abstract: In this paper, we have introduced a new class of complex valued harmonic functions which are orientation preserving and univalent in the open unit disc and are related to uniformly convex functions. Coefficient bounds, neighborhood and extreme points for the functions belonging to this class are obtained.

2000 AMS subject classification: Primary 30C45, Secondary 30C50, 30C55.

Key Words: Harmonic, derivative operator, univalent, Neighborhoods, extreme points.

I. INTRODUCTION

A continuous complex-valued function $f(z) = u + iv$ is defined in a simply-connected complex domain D is said to be harmonic in D if both u and v are real harmonic in D . Such functions can be expressed as

$$f(z) = h(z) + \overline{g(z)} \quad (1.1)$$

where $h(z)$ and $g(z)$ are analytic in D . We call $h(z)$ the analytic part and $g(z)$ the co-analytic part of $f(z)$. A necessary and sufficient condition for $f(z)$ to be locally univalent and sense preserving in D is that $|\overline{h'(z)}| > |g'(z)|$ for all z in D , Clunie and Shell-Smail [2]. Let H be the class of functions of the form (1.1) that are harmonic univalent and sense-preserving in the unit disk $U = \{z : |z| < 1\}$ for which $f(0) = f_z(0) - 1 = 0$. Then for $f(z) = h(z) + \overline{g(z)} \in H$,

we may express the analytic functions $h(z)$ and $g(z)$ as

$$h(z) = z + \sum_{k=2}^{\infty} a_k z^k, \quad g(z) = \sum_{k=1}^{\infty} b_k z^k, \quad z \in U, \quad |b_1| < 1 \quad (1.2)$$

In 1984, Clunie and Sheil-Small [2] investigated the class S_H as well as its geometric subclasses and obtained some coefficient bounds. Since then, there have been several related papers on S_H and its subclasses. Now we will introduce a generalized derivative operator for $f(z) = h(z) + \overline{g(z)}$ given by (1.2). For fixed positive natural m and $\lambda_2 \geq \lambda_1 \geq 0$,

$$D_{\lambda_1, \lambda_2}^{m, k} f(z) = D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)}, \quad z \in U \quad (1.3)$$

where

$$D_{\lambda_1, \lambda_2}^{m, k} h(z) = z + \sum_{k=2}^{\infty} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m a_k z^k$$

and

$$D_{\lambda_1, \lambda_2}^{m, k} g(z) = \sum_{k=1}^{\infty} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m b_k z^k.$$

We note that by specializing the parameters, especially when $\lambda_1 = \lambda_2 = 0$, $D_{\lambda_1, \lambda_2}^{m, k}$ reduces to D_m which introduced by Salagean in [6].

Now we will introduce the following definition.

Definition 1.1. For $0 \leq l < 1$, let $G_H(l, m, k, \lambda_1, \lambda_2)$ denote the subfamily of starlike harmonic functions $f(z) \in H$ of the form (1.1) such that

$$\operatorname{Re} \left\{ \left(1 + e^{i\psi} \right) \frac{z \left(D_{\lambda_1, \lambda_2}^{m, k} f(z) \right)' }{z' \left(D_{\lambda_1, \lambda_2}^{m, k} f_t(z) \right)} - e^{i\psi} \right\} \geq l \quad \text{for } z \in U, \quad (1.4)$$

Where $f_t(z) = (1-t)z + t(h(z) + \overline{g(z)})$,

$$\left(D_{\lambda_1, \lambda_2}^{m, k} f(z) \right)' = \frac{d}{d\theta} \left(D_{\lambda_1, \lambda_2}^{m, k} f(re^{i\theta}) \right), \frac{d}{d\theta} (z = re^{i\theta}).$$

We also let $V_H(l, m, k, \lambda_1, \lambda_2) = G_H(l, m, k, \lambda_1, \lambda_2) \cap V_H$ where V_H is the class of harmonic functions with varying arguments introduced by Jahangiri and Silverman [3] consisting of functions $f(z)$ of the form (1.1) in H for which there exists a real number ϕ such that

$$\eta_k + (k-1)\phi = \pi \pmod{2\pi}, \quad \delta_k + (k-1)\phi = 0 \pmod{2\pi} \quad (k \geq 2), \quad (1.5)$$

where $\eta_k = \arg(a_k)$ and $\delta_k = \arg(b_k)$. The same class introduced in [4] with different differential operator.

In this paper, we obtain a sufficient coefficient condition for functions $f(z)$ given by (1.2) to be in the class $G_H(l, m, k, \lambda_1, \lambda_2)$. It is shown that this coefficient condition is necessary also for functions belonging to the class $V_H(l, m, k, \lambda_1, \lambda_2)$. Further, extreme points for functions in $V_H(l, m, k, \lambda_1, \lambda_2)$ are also obtained.

II. MAIN RESULT

We begin deriving a sufficient coefficient condition for the functions belonging to the class $G_H(l, m, k, \lambda_1, \lambda_2)$. This result is contained in the following.

Theorem 2.1. Let $f(z) = h(z) + \overline{g(z)}$ given by (1.2). Furthermore, let

$$\sum_{k=2}^{\infty} \left(\frac{2k-t-lt}{1-l} |a_k| + \frac{2k+t+lt}{1-l} |b_k| \right) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m \leq 1 - \frac{2+t+lt}{3-l} b_1 \quad (2.1)$$

where $0 \leq l < 1$, then $f \in G_H(l, m, k, \lambda_1, \lambda_2)$.

Proof: We first show that if the inequality (2.1) holds for the coefficients of $f(z) = h(z) + \overline{g(z)}$, then the required condition (1.4) is satisfied. Using (1.3) and (1.4), we can write

$$\operatorname{Re} \left\{ \left(1 + e^{i\psi} \right) \frac{z \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) \right)' - z \left(D_{\lambda_1, \lambda_2}^{m, k} g(z) \right)'}{(1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right)} - e^{i\psi} \right\} = \operatorname{Re} \left\{ \frac{A(z)}{B(z)} \right\} \quad (2.2)$$

where

$$A(z) = \left(1 + e^{i\psi} \right) \left[z \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) \right)' - z \left(D_{\lambda_1, \lambda_2}^{m, k} g(z) \right)' \right] - e^{i\psi} \left[(1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right) \right]$$

$$B(z) = (1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right).$$

In view of the simple assertion that $\operatorname{Re}(w) \geq l$ if and only if $|1-l+w| \geq |1+l-w|$, it suffices to show that

$$|A(z) + (1-l)B(z)| - |A(z) - (1+l)B(z)| \geq 0. \quad (2.3)$$

Substituting for $A(z)$ and $B(z)$ the appropriate expressions in (2.3), we get

$$\begin{aligned} & |A(z) + (1-l)B(z)| - |A(z) - (1+l)B(z)| \\ & \geq 2(1-l)|z| - \sum_{k=2}^{\infty} (4k-2t-2lt) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m |a_k| |z|^k \end{aligned}$$

$$\begin{aligned}
 & -\sum_{k=2}^{\infty} (4k + 2t + 2lt) \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m |b_k| |z|^k - 4|b_1| - 2t|b_1| - 2lt|b_1| \\
 \geq & 2(1-l) \left\{ 1 - \frac{2+t+lt}{1-l} |b_1| - \sum_{k=2}^{\infty} \left(\frac{2k-t-lt}{1-l} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m |a_k| \right. \right. \\
 & \left. \left. + \frac{2k+t+lt}{1-l} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m |b_k| \right) \right\} \geq 0
 \end{aligned}$$

by virtue of the inequality (2.1). This implies that $f(z) \in G_H(l, m, k, \lambda_1, \lambda_2)$.

Now we obtain the necessary and sufficient condition for function $f(z) = h(z) + \overline{g(z)}$ be given with condition (1.5).

Theorem 2.2. Let $f(z) = h(z) + \overline{g(z)}$ be given by (2). Then $f(z) \in V_H(l, m, k, \lambda_1, \lambda_2)$ if and only if

$$\sum_{k=2}^{\infty} \left[\frac{2k-t-lt}{1-l} |a_k| + \frac{2k+t+lt}{1-l} |b_k| \right] \left[\left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m \right] \leq 1 - \frac{2+t+lt}{3-l} |b_1| \quad (2.4) \text{ where}$$

$0 \leq l < 1$.

Proof. Since $V_H(l, m, k, \lambda_1, \lambda_2) \subset G_H(l, m, k, \lambda_1, \lambda_2)$, we only need to prove the necessary part of the theorem. Assume that $f(z) \in V_H(l, m, k, \lambda_1, \lambda_2)$, then by virtue of (1.3) to (1.4), we obtain

$$\operatorname{Re} \left\{ \left(1 + e^{i\psi} \right) \frac{z \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) \right)' - \overline{z \left(D_{\lambda_1, \lambda_2}^{m, k} g(z) \right)'}}{(1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right)} - (e^{i\psi} + l) \right\} \geq 0. \quad (2.5)$$

The above inequality is equivalent to

$$\begin{aligned}
 & \operatorname{Re} \left\{ \left(1 + e^{i\psi} \right) \left[z \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) \right)' - \overline{z \left(D_{\lambda_1, \lambda_2}^{m, k} g(z) \right)' } \right] - (e^{i\psi} + l) \left[(1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right) \right] \right\} \\
 & \quad \times \left((1-t)z + t \left(D_{\lambda_1, \lambda_2}^{m, k} h(z) + \overline{D_{\lambda_1, \lambda_2}^{m, k} g(z)} \right) \right)^{-1} \\
 & = \operatorname{Re} \left\{ (1-l)z + \left(\sum_{k=2}^{\infty} \left[k(1 + e^{i\psi}) - e^{i\psi}t - lt \right] \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m a_k z^k \right. \right. \\
 & \quad \left. \left. - \sum_{k=1}^{\infty} \left[k(1 + e^{i\psi}) + e^{i\psi}t + lt \right] \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m b_k z^{-k} \right) \right. \\
 & \quad \left. \times \left(z + t \sum_{k=1}^{\infty} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m a_k z^k + t \sum_{k=1}^{\infty} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m b_k z^{-k} \right)^{-1} \right\} \\
 & = \operatorname{Re} \left\{ (1-l) + \left(\sum_{k=2}^{\infty} \left[k(1 + e^{i\psi}) - e^{i\psi}t - lt \right] \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{1 + \lambda_2(k-1)} \right)^m a_k z^{k-1} \right. \right.
 \end{aligned}$$

$$\left. -\frac{\bar{z}}{z} \sum_{k=1}^{\infty} \left[k(1+e^{i\psi}) + e^{i\psi}t + lt \right] \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m b_k \bar{z}^{-k-1} \right) \\ \times \left(1+t \sum_{k=1}^{\infty} \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m a_k z^{k-1} + t \frac{\bar{z}}{z} \sum_{k=1}^{\infty} \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m b_k \bar{z}^{-k-1} \right)^{-1} \Bigg\} \geq 0.$$

This condition must hold for all values of z , such that $|z|=r < 1$. Upon choosing ϕ according to (1.5) and noting that $\operatorname{Re}(-e^{i\psi}) \geq -|e^{i\psi}| = -1$, the above inequality reduces to

$$(1-l) + (2+t+lt)b_1 - \left(\sum_{k=2}^{\infty} \left[k(1+e^{i\psi}) - e^{i\psi}t - lt \right] \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m |a_k| r^{k-1} \right. \\ \left. + \left[k(1+e^{i\psi}) + e^{i\psi}t + lt \right] \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m |b_k| r^{k-1} \right) \\ \times \left(1+t \sum_{k=1}^{\infty} \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m |a_k| r^{k-1} + t \sum_{k=1}^{\infty} \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{1+\lambda_2(k-1)} \right)^m |b_k| r^{k-1} \right)^{-1} \Bigg\} \geq 0. \quad (2.6)$$

If (2.4) does not hold, then the numerator in (2.6) is negative for r sufficiently close to 1. Therefore, there exists a point $z_0 = r_0$ in $(0,1)$ for which the quotient in (2.6) is negative. This contradicts our assumption that $f(z) \in V_H(l, m, k, \lambda_1, \lambda_2)$. We thus conclude that it is both necessary and sufficient that the coefficient bound inequality (2.4) holds true when $f(z) \in V_H(l, m, k, \lambda_1, \lambda_2)$.

This completes the proof of Theorem 2.2.

Theorem 2.3. The closed convex hull of $f(z) \in V_H(l, m, k, \lambda_1, \lambda_2)$ (denoted by $clcoV_H(l, m, k, \lambda_1, \lambda_2)$) is

$$\left\{ f(z) = z + \sum_{k=2}^{\infty} |a_k| z^k + \overline{\sum_{k=1}^{\infty} |b_k| z^k} : \sum_{k=2}^{\infty} k[|a_k| + |b_k|] < 1 - b_1 \right\}$$

By setting

$$\lambda_k = \frac{1-l}{(2k-t-lt) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m} \text{ and } \mu_k = \frac{1+l}{(2k+t+lt) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m}, \text{ then}$$

for b_1 fixed, the extreme points for $clcoV_H(l, m, k, \lambda_1, \lambda_2)$ are

$$\{z + \lambda_k x z^k + \overline{b_1 z}\} \cup \{z + \overline{b_1 z} + \mu_k x z^k\} \quad (2.7)$$

where $k \geq 2$ and $|x| = 1 - |b_1|$.

Proof: Any function $f(z)$ in $clcoV_H(l, m, k, \lambda_1, \lambda_2)$ may be expressed as

$$f(z) = z + \sum_{k=2}^{\infty} |a_k| e^{i\eta k} z^k + \overline{b_1 z} + \sum_{k=1}^{\infty} |b_k| e^{i\delta k} z^k$$

where the coefficients satisfy the inequality (2.1). Set $h_1(z) = z$, $g_1(z) = b_1z$, $h_k(z) = z + \lambda_k e^{i\eta k} z^k$, $g_k(z) = b_1z + \mu_k e^{i\delta k} z^k$ for $k = 2, 3, 4, \dots$. Writing $\chi_k = \frac{|a_k|}{\lambda_k}$, $Y_k = \frac{|b_k|}{\mu_k}$, $k = 2, 3, 4, \dots$ and $\chi_1 = 1 - \sum_{k=2}^{\infty} \chi_k$;

$Y_1 = 1 - \sum_{k=2}^{\infty} Y_k$, we get

$$f(z) = \sum_{k=1}^{\infty} (\chi_k h_k(z) + Y_k g_k(z)).$$

In particular, setting $f_1(z) = z + \overline{b_1}z$ and $f_k(z) = z + \lambda_k xz^k + \overline{b_1}z + \overline{\mu_k y}z^k$, ($k \geq 2, |x| + |y| = 1 - |b_1|$),

we see that extreme points of $clco f(z) \in V_H(l, m, k, \lambda_1, \lambda_2) \subset \{f_k(z)\}$.

To see that $f_1(z)$ is not in extreme point, note that $f_1(z)$ may written as

$$f_1(z) = \frac{1}{2} \{f_1(z) + \lambda_2(1 - |b_1|)z^2\} + \frac{1}{2} \{f_1(z) - \lambda_2(1 - |b_1|)z^2\}$$

a convex linear combination of functions in $clcoV_H(l, m, k, \lambda_1, \lambda_2)$.

To see that f_m is not an extreme point if both $|x| \neq 0$ and $|y| \neq 0$, we will show that it can then also be expressed as a convex linear combinations of functions in $clcoV_H(l, m, k, \lambda_1, \lambda_2)$. Without loss of generality, assume $|x| \geq |y|$.

Choose $\epsilon > 0$ small enough so that $\epsilon > \left| \frac{x}{y} \right|$. Set $A = 1 + \epsilon$ and $B = 1 + \left| \frac{\epsilon x}{y} \right|$. We then see that both

$$t_1(z) = z + \lambda_k Axz^k + \overline{b_1}z + \overline{\mu_k y}Bz^k \text{ and}$$

$$t_2(z) = z + \lambda_k (2 - A)xz^k + \overline{b_1}z + \overline{\mu_k y}(2 - B)z^k \text{ are in } clcoV_H(l, m, k, \lambda_1, \lambda_2) \text{ and that}$$

$$f_k(z) = \frac{1}{2} \{t_1(z) + t_2(z)\}.$$

The extremal coefficient bounds show that functions of the form (12) are the extreme points for $clcoV_H(l, m, k, \lambda_1, \lambda_2)$, and so the proof is complete.

Following Avici and Zlotkiewicz [1] and Ruscheweyh [5], we refer to the δ -neighborhood of the functions $f(z)$ defined by (1.2) to be the set of functions F for which

$$N_\delta(f) = \left\{ F(z) = z + \sum_{k=2}^{\infty} A_k z^k + \sum_{k=1}^{\infty} \overline{B_k} z^k, \sum_{k=2}^{\infty} k (|a_k - A_k| + |b_k - B_k| + |b_1 - B_1|) \leq \delta \right\} \quad (2.8)$$

In our case, let us define the generalized δ -neighborhood of $f(z)$ to be the set

$$N_\delta(f) = \left\{ F(z) : \sum_{k=2}^{\infty} \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m [(2k - t - lt)|a_k - A_k| + (2k + t + lt)|b_k - B_k|] + (1-l)|b_1 - B_1| \leq (1-l)\delta \right\}. \quad (2.9)$$

Theorem 2.4. Let $f(z)$ be given by (1.2). If $f(z)$ satisfies the conditions

$$\sum_{k=2}^{\infty} k(2k - t - lt)|a_k| \left(\frac{1 + (\lambda_1 + \lambda_2)(k-1)}{\lambda_2(k-1)} \right)^m$$

$$+\sum_{k=1}^{\infty} k(2k+t+lt)|b_k|\left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)}\right)^m \leq (1-l), \quad (2.10)$$

where $0 \leq l < 1$ and $\delta = \frac{1-l}{3-t-lt} \left(1 - \frac{2+t+lt}{1-l}|b_1|\right)$ (2.11)

then $N(f) \subset G_H(l, m, k, \lambda_1, \lambda_2)$.

Proof. Let $f(z)$ satisfy (15) and $F(z)$ be given by

$$F(z) = z + \overline{B_1}z + \sum_{k=2}^{\infty} (A_k z^k + \overline{B_k} z^k)$$

which belong to to $N(f)$. We obtain

$$\begin{aligned} & (2+t+lt)|B_1| + \sum_{k=2}^{\infty} ((2k-t-lt)|A_k| + (2k+t+lt)|B_k|) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)}\right)^m \\ & \leq (2+t+lt)|B_1 - b_1| + (2+t+lt)|b_1| \\ & \quad + \sum_{k=2}^{\infty} ((2k-t-lt)|A_k - a_k| + (2k+t+lt)|B_k - b_k|) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)}\right)^m \\ & \quad + \sum_{k=2}^{\infty} ((2k-t-lt)|a_k| + (2k+t+lt)|b_k|) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)}\right)^m \\ & \leq (1-l)\delta + (2+t+lt)|b_1| \\ & \quad + \frac{1}{3-l} \sum_{k=2}^{\infty} k((2k-t-lt)|a_k| + (2k+t+lt)|b_k|) \left(\frac{1+(\lambda_1+\lambda_2)(k-1)}{\lambda_2(k-1)}\right)^m \\ & \leq (1-l)\delta + (2+t+lt)|b_1| + \frac{1}{3-l} [(1-l) - (2+t+lt)|b_1|] \leq 1-l. \end{aligned}$$

Hence for $\delta = \frac{1-l}{3-l} \left(1 - \frac{2+t+lt}{1-l}|b_1|\right)$, we infer that $F(z) \in G_H(l, m, k, \lambda_1, \lambda_2)$ which concludes the proof Theorem 2.4.

Abstract: To authenticate the given image is important task in the internet communication. For this the technique is proposed in this paper. The original image is first converted into the gray scale image. Then consider the Y component of the given image get divided into different block size i.e. (2x2, 4x4 or 8x8). The Y component is get divided into 2 level decomposition. With the help of the canny edge detector we can get features to generate the watermark. By using this we get the watermark which is used for embedding in the given image. The arnold transform is used to remove the space relativity in DWT. After extraction process with the help of key we authenticate the given image. There is no degradation to the original image. Experiments shows that system is useful to get authentication requirement.

Keywords: Discrete Wavelet Transform; contour authentication;

I. INTRODUCTION

As the electronic media is get popular for communication, the secure communication is the important task in electronic media. Now a days there are large techniques available with different technologies. among them authentication is the important task for secure communication. On the basis of authentication we can able to find out the authorized user, image or data.

There are number of existing technique which provides the authentication on which we can find the authorized data. The most important technique used for digital data authentication is encryption i.e. public key encryption which is also called traditional method of authentication. Another technique available is watermarking. Digital watermarking is a technique which hide some logo or data in the given image so that we prevent copyright, integrity and/or the authenticity of the original data [1-2]. Usually, a robust watermarking is used to protect the copyright while a fragile or semi-fragile watermarking is used to verify the authenticity [3-4]. Authentication of image data is a challenging task. Content modification or tampering is defined as an object appearance or disappearance, a modification to an object position, or changes to texture, color or edges. Image watermarking algorithm used to detect tampering has several essential properties. First is transparency. The embedding processing should not degrade the quality of the original digital media and should be perceptually invisible to maintain its protective secrecy and sensitivity. The embedded watermark is robust to resist normal image processing (such as JPEG compression) while it is fragile to malicious tampering to image content. The watermark is embedded in a secure way and it can't be removed illegally [5-10].

We propose the new technique of authentication in which we can use the watermark which is generated from the same cover image. Watermark is generated with the help of DWT method for the contour image and apply the arnold transform for the given image. The watermark which is generated is stored into LH or HL band so we get the standard result.

This paper is organized as follows: Section 1 introduces related works. Section 2 details the system diagram & workflow steps. Section 3 details the detailed steps. Experiments are presented in section 4. Finally, conclusions are drawn in section 5.

II. SYSTEM ARCHITECTURE

The design of given system is basically divided into the two steps. In this first is watermark embedding and second watermark extraction. As we are going in detailed we found some properties of image make the watermark embedding as easy task.

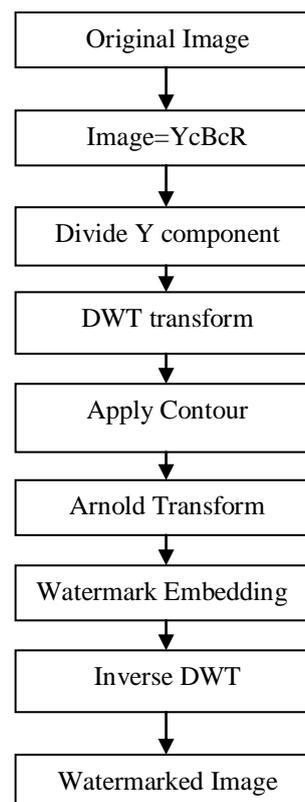

Figure 1: Watermark Embedding process

The above diagram for the watermark embedding and details of the diagram are given in the mathematical model.

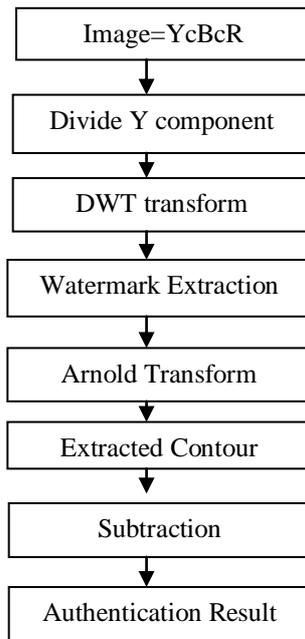

Figure 2: Watermark Extraction Process

As watermark is embedded we need to extract the watermark. Block diagram for the watermark extraction are shown above.

III. DETAILED DESIGN

1. Watermark Embedding Process

The watermark embedding process is shown with following steps:

- Step1. Original image is converted into YcBcR color space.
- Step2. The subdivision Y is divided into 4x4,2x2 and 8x8 image blocks. Then perform two-level DWT transform block by block.
- Step3. The image contour is calculated based on sub-band image LL2 using Canny edge detector and then filtered to get a binary image as a watermark.
- Step4. Watermark image is Arnold transformed to increases the security of watermarking algorithm greatly.
- Step5. The middle coefficients of first level DWT transform HL1 and LH1 are selected to embed watermark bits.
- Step6. Apply the inverse DWT transform to all the blocks to get the watermarked image.

After embedding the watermark PSNR is calculated for all these three blocks size.

2. Watermark Extraction Process

- Step1. Original image is executed two level DWT transforms to calculate the contour image W using Canny calculator just like the operations in watermark embedding.
- Step2. The watermark information is extracted from middle coefficients which are selected to embed watermark . Construct the watermark image by

the inverse displacing, and we get the extracted watermark image W*.

$$D(i,j)=|W(i,j)-W^*(i,j)|$$

where i,j denotes the rows and column number.

Step3. The calculated image and extracted image is subtracted, the result will be used to authenticate image content.

IV. EXPERIMENTAL RESULTS

The experiments in this paper are tested with MATLAB 7.0. The original image used to test is a 512x512 image.

1. PSNR

The PSNR rates for all three images are calculated. From the results we found that 8x8 block shows good authentication results. Also if we go for compression the PSNR rate is decreases.

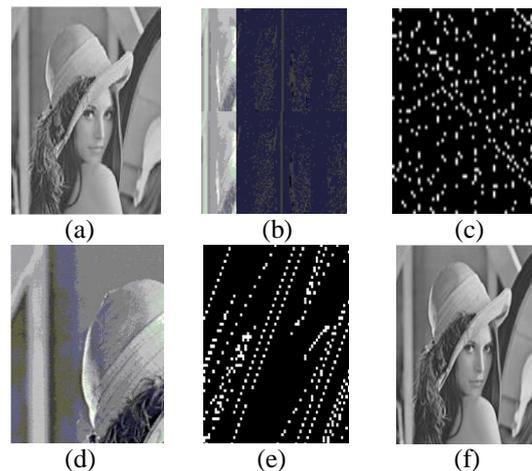

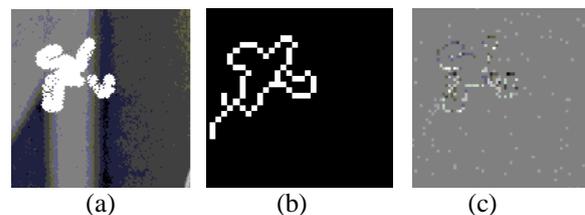

Figure 3: Perceptibility Test (a)Original Image (b) 2-level DWT (c) Contour Image (d) Selected area (e) Inverse DWT (f) Watermarked Image

TABLE1: COMPARISION OF PSNR

Block size	Watermark Region	PSNR
2x2	LH or HL	47.94
4x4	LH or HL	58.36
8x8	LH or HL	65.07

2. Operational Test:

In the different operational test we found the given algorithm is best for paste attacked image.

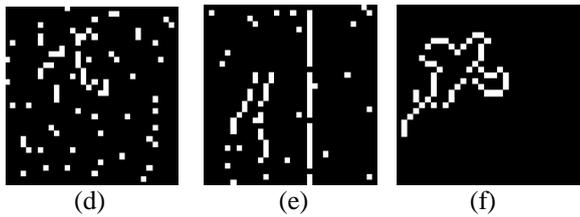

Figure 4: (a) Original Image (b) Canny Image (c) Gray scale Image (d) Arnold Transfer (e) Inverse DWT Authentication

From the above results we can say that our algorithm is sensitive for the authentication of watermarked image.

V. CONCLUSION

In this paper we used DWT transform method for watermark embedding. Also due to arnold transform space relativity is get reduced. From the above result we can say that algorithm which is proposed here is good as compared to previous one.

In this particular algorithm we can use any logo or another image as the watermark to embed in the given region. So it is easy to improve the result by such experiment.

Abstract: this paper is outlined basic model based on Fourier series is capable of generating realistic synthetic electrocardiogram (ECG) signals. The operator can specify the heart rate, the variation, position and amplitude of pulses. The beat-to-beat variation and timing of the human ECG, including QT and R-peak amplitude are shown in result. An adaptive LMS filter is implemented to remove the noise of ECG signal. This model may be employed to consider biomedical signal processing techniques that are used to calculate clinical statistics from the ECG signal. Model is derived and successfully simulated in MATLAB.

Keywords: ECG signal, Heart rate variation, realistic model, PQRST pulse, QRS analysis, Adaptive filtering, LMS algorithm.

I. INTRODUCTION

ECG is vital in order to find out heart disease in early phase of its occurrence. The real time ECG signal is more multifaceted in nature and to represent ECG signal adequate mathematical analysis should prefer over the range and nature of signal. The various models have been proposed for clearing up ECG signal OFF line generation. A realistic synthetic ECG signal was modelling using dynamic model [1] and thus authors have taken the efforts to exact curve fitting of ECG signal. An intracellular potential based skin surface model [3] has been suggested and simulating for normal heart operation. In most of time percentage, root mean square difference [4] is used to reconstruct ECG signal. However, the voltage difference method [5] has recommended exact procedure of obtaining an ECG signal with enhanced features. The present paper discusses the natures of ECG signal and derivation of mathematical equation that describe resultant ECG pulse approximately close to realistic ECG signal. The ECG signal has modelled using Fourier series method [6].

ECG signal is influenced with many artefacts and thus noise can add into ECG signal. The de-noising of ECG signal is essential for detecting heart disease. An adaptive filter algorithm is used for de-nosing of ECG signal. The analog filter is implemented followed by adaptive filter for better performance. The de-noising is essential especially for power line noise and base line wonder and should separate from ECG signal. An attempt is made in this present work to remove out ECG noise using adaptive filtering technique.

The ECG signal is the resultant function of heart activity and intracellular potential developed due to action of heart. SA node, atrial muscle, AV node, common bundle fibres,

bundle Branches, Purkinje fibres, ventricular muscles are literal cause of resultant ECG signal, and hence any abnormality can be localised by observing ECG signal [7]. A normal form of ECG signal is presenting in figure 1.

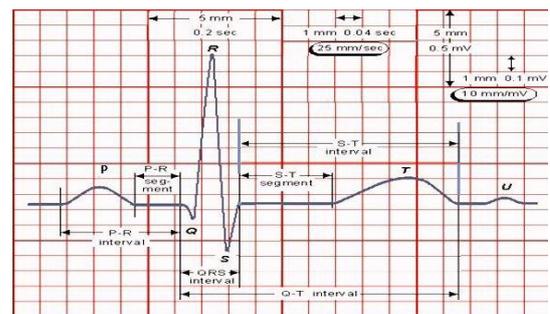

Figure 1: A normal form of ECG signal

II. MATHEMATICAL MODEL

An ECG signal is the combination of number of pulses resulting due to heart activity. if mathematical model of one pulse is derived then on similar basis other pulses can be represented. Consider $S(t)$ is the ECG signal in time domain. According to the geometry of one ECG pulse it is represented as

$$S(t) = A_0(1 - e^{-\frac{t}{\tau}}) - A_0 e^{-\frac{t}{\tau}}$$

$$S(t) = A_0(1 - 2e^{-\frac{t}{\tau}})$$

ECG is the resultant signal obtaining after addition of minimum three to maximum n number of pulses.

$$S(t) = A_0(1 - 2e^{-\frac{t}{\tau_0}}) + A_1(1 - 2e^{-\frac{t}{\tau_1}}) + \dots + A_n(1 - 2e^{-\frac{t}{\tau_n}})$$

The pulses are periodic and continuous pulses and represented by using Fourier series method. The one pulse is given by using Fourier series method.

$$S(t) = a_0 + \sum_n a_n \cos(2\pi n f_0 t) + \sum_n b_n \sin(2\pi n f_0 t)$$

Where,

$$a_0 = \frac{1}{T} \int_{t_0}^{t_0+T} S(t) dt$$

$$a_n = \frac{2}{T} \int_{t_0}^{t_0+T} S(t) \cos(2\pi n f_0 t) dt$$

$$b_n = \frac{2}{T} \int_{t_0}^{t_0+T} S(t) \sin(2\pi n f_0 t) dt$$

Consider general one pulse segment

$$S(t) = A(1 - 2e^{-\frac{t}{\tau}})$$

$$a_0 = \frac{1}{T} \int_0^T A(1 - 2e^{-\frac{t}{\tau}}) dt$$

$$a_n = \frac{2}{T} \int_0^T A(1 - 2e^{-\frac{t}{\tau}}) \cos(2\pi n f_0 t) dt$$

$$b_n = \frac{2}{T} \int_0^T A(1 - 2e^{-\frac{t}{\tau}}) \sin(2\pi n f_0 t) dt$$

The solution is

$$a_0 = A + \frac{2A\tau}{T} \left(e^{-\frac{T}{\tau}} - 1 \right)$$

$$a_n = \frac{4/T}{\left(\frac{1}{\tau}\right)^2 + (2\pi n f_0)^2} \left(e^{-\frac{T}{\tau}} - \frac{1}{\tau} \right)$$

$$b_n = \frac{-A}{\pi n} - \frac{(4/T)(2\pi n f_0)}{\left(\frac{1}{\tau}\right)^2 + (2\pi n f_0)^2} \left(1 - e^{-\frac{T}{\tau}} \right)$$

One pulse of ECG signal is represented by using Fourier series as

$$S(t) = A + \frac{2A\tau}{T} \left(e^{-\frac{T}{\tau}} - 1 \right) + \sum_{n=1,2,3} \left(\frac{4/T}{\left(\frac{1}{\tau}\right)^2 + (2\pi n f_0)^2} \left(e^{-\frac{T}{\tau}} - \frac{1}{\tau} \right) \right) \cos(2\pi n f_0 t) + \sum_{n=1,2,3} \left(\frac{-A}{\pi n} - \frac{(4/T)(2\pi n f_0)}{\left(\frac{1}{\tau}\right)^2 + (2\pi n f_0)^2} \left(1 - e^{-\frac{T}{\tau}} \right) \right) \sin(2\pi n f_0 t)$$

III. MATLAB MODEL

Mathematical model of ECG signal is discussed in previous section. The equation in terms of Fourier series is representing ECG signal. MATLAB model is constructed to implement the mathematical ECG signal. Figure 2 shows one pulse model of ECG signal. Thus one pulse is generated using MATLAB model. Minimum three pulses are needed to represent ECG signal. Seven pulses are sufficient to simulate complete ECG signal. Figure 3

shows a five pulse model of ECG signal and finally figure 4 is ECG toolbox created for OFF line ECG processing.

Removal of power line noise and base line wander is vital problem in ECG signal processing. The various types of filters are useful for removing of noise. Here, an attempt is made using adaptive List Mean Square (LMS) algorithm based filters to remove the ECG noise. Figure 5 shows the matlab model containing OFF line ECG generator, noise adder, equalised LMS filter, analog filter, and scope. Analog filter is used after the adaptive LMS filter, the figure 6 shoes the results.

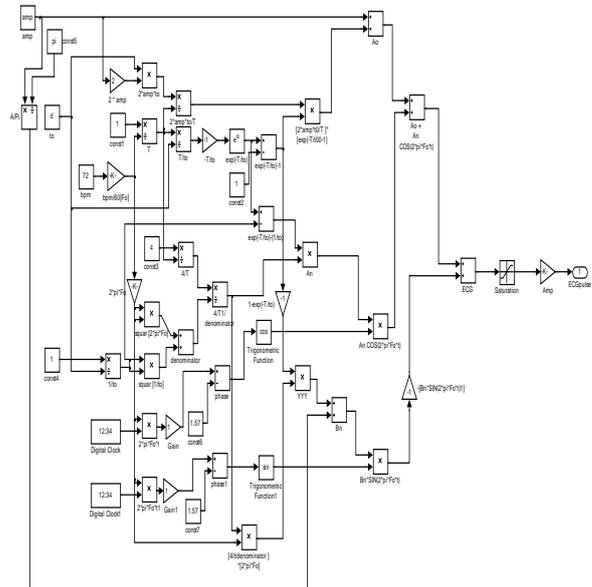

Figure 2 MATLAB equation model

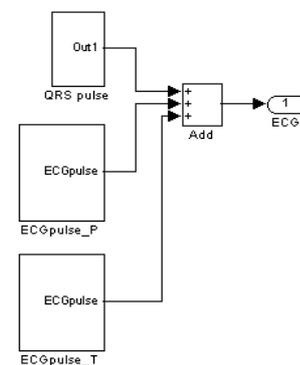

Figure 3 Five pulse ECG signal

Figure 4 ECG tool box

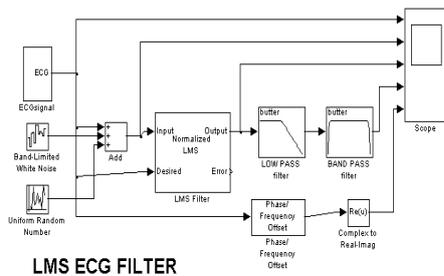

Figure 5 LMS filter

IV. RESULTS

Properties of ECG pulses are given in table 1.

Table 1 Properties of ECG pulses [1]

Index (i)	P	Q	R	S	T
Time (secs)	-0.2	-0.05	0	0.05	0.3
θ_i (radians)	$-\frac{1}{3}\pi$	$-\frac{1}{12}\pi$	0	$\frac{1}{12}\pi$	$\frac{1}{2}\pi$
a_i	1.2	-5.0	30.0	-7.5	0.75
b_i	0.25	0.1	0.1	0.1	0.4

Typical ECG is used to suggest suitable times, angles and values of the PQRST points. The times and angles are specified relative to the position of the R-peak as shown in Table I. Output result is shown in figure 6. The 1st wave is reference ECG signal generated using Fourier series method. The 2nd waveform is showing ECG signal with added noise. The 3rd waveform shows output of adaptive LMS filter. This output waveform contains high and mid band frequency noise. This noise may remain present due to adaptive iteration action. Finally analog low pass and band pass filter is used to remove out remaining noise present in ECG signal. The 4th wave form indicating final output after analog filtering.

Figure 6 Results

V. CONCLUSION

Mathematical model has been introduced which is capable of intrigues the significant features of the ECG signal. Realistic ECG has important relevance in medical signal processing techniques. As compared with noise ECG signal with adaptive filter output waveform, it is clear that LMS filtering technique removes most of the noise present in the ECG signal. When analog filter is followed by after adaptive filtering, it is clear from the waveform that noises have been removed completely. Hence, the combination of adaptive and analog filtering removes noises present in the signal.

Detection the Ratio of Bilirubin in Human Body Using Laser Technology

Mohammed F. Mohammed¹, Dina J. Matti², Rasha K. Mohammed³
Laser and Optoelectronics Engineering Department, Nahrain University/ Baghdad – Iraq

Abstract: In this work, an analytical study to detect the ratio of bilirubin in human body by determining the level of it in blood using a 532nm laser light transported through some samples of bilirubin has been presented. A second harmonic generation of Nd:YAG laser with measured maximum output power 52.5 mW was used to determine the concentration of total bilirubin in blood. Initially, the cuvette was filled with a sample of standard bilirubin level and then it is filled by a sample of blood containing unknown levels of bilirubin. The absorption factor was calculated for four samples of adults' blood and five samples of babies' blood, and the scattering factor was neglected for each sample. The unknown concentration of total bilirubin was determined and the transmitted power through these samples of blood was measured. In this work, a good matching was obtained between the results of the concentrations of bilirubin in blood using laser technique and the results of the classical medical procedure of measuring the bilirubin concentrations. Therefore, the jaundice in human was detected.

I. INTRODUCTION

Jaundice is a yellowish staining of the skin, sclera and mucous membranes by deposition of bilirubin (a yellow orange bile pigment) in these tissues. Jaundice was once called the "morbus regius" (the regal disease) in the belief that only the touch of king could cure it. Jaundice indicates excessive levels of conjugated or unconjugated bilirubin in the blood and it is clinically apparent when the bilirubin level exceeds 2mg/dl (34.2 $\mu\text{mol/L}$) [1].

In fair-skinned patients, jaundice is most noticeable on face, trunk, and sclerae; in dark-skinned patients, its noticeable on the hard palate, sclerae, and conjunctivae-pseudo jaundice may be found in black patients with pigmented sclera, from carotinemia, uremia (a sallow yellowish pallor), and quinacrine (a yellow-green color) [2]. Causes of jaundice can be classified into Pre-hepatic, hepatic or post hepatic [2]. Tissue deposition of bilirubin occurs only in the presence of serum hyperbilirubinemia and is a sign of either liver disease or, less often, hemolytic disorder. Another sensitive indicator of increased serum bilirubin is darkening of the urine, which is due to the renal excretion of conjugated bilirubin. Patients often describe their urine as tea or cola colored [3].

Jaundice can be classified into two groups; the first group is the physiological jaundice and the second group is the pathological jaundice of neonates. The causes of jaundice can be grouped into the following categories in Fig.1 [3]

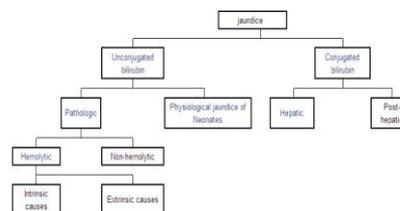

Fig.1 Causes of jaundice

II. BILIRUBIN

Bilirubin (formerly referred to as hematoidin) is the yellow breakdown product of normal heme catabolism. It is excreted in bile and urine, and elevated levels may indicate certain diseases. It is responsible for the yellow color of bruises, urine, and the yellow discoloration in jaundice [4].

Bilirubin consists of open chain of four pyrrole-like rings (tetrapyrrole). In heme, by contrast, these four rings are connected into a larger ring called a porphyrin ring as shown in Fig.2 and the molecular formula of bilirubin is $\text{C}_{33}\text{H}_{36}\text{N}_4\text{O}_6$ [4].

Bilirubin is created by the activity of biliverdin reductase on biliverdin, a green tetrapyrrolic bile pigment which is also a product of heme catabolism [5, 6].

Fig.2 The atomic structure of bilirubin

III. UNCONJUGATED BILIRUBIN

Erythrocytes (red blood cells) generated in the bone marrow are disposed of in the spleen when they get old or damaged. This released hemoglobin, which is broken down to heme as the globin parts. The heme is then turned into unconjugated bilirubin in the reticuloendothelial cells of the spleen, which is not soluble in water. It is then bound to albumin and sent to the liver [5,6].

IV. CONJUGATED BILIRUBIN

In the liver it's conjugated with glucuronic acid by the enzyme glucuronyltransferase, making it soluble in water. Much of it goes into the bile and thus out into the small intestine. Some of the conjugated bilirubin remains in the large intestine and is metabolized by colonic

bacteria to urobilinogen, which is further metabolized to stercobilinogen, and finally oxidized to stercobilin, which it gives feces its brown color [5, 6].

There are many methods for determination the concentration of bilirubin such as [6]:

A. Determination of the concentration of bilirubin in serum by:

- Rapid micro-method employing photoelectric colorimeter.
- Rapid micro-method employing color standards.

B. Determination of free bilirubin and its binding capacity by HAS using a microfluidic chip-capillary electrophoresis device with multi-segment circular-ferrofluid-driven micro mixing injection.

C. Measurements the concentration of bilirubin by using laser technology, this method depends on the laser beam attenuation and it's considered in this work.

V. ATTENUATION OF LIGHT

The beam attenuation coefficient $\alpha(\lambda)$ is used to characterize the optical transmission properties of matter, it's a measure of decay of the unscattered light and its given by the equation (1) [7]

$$P_1(\lambda) = P_o(\lambda)e^{-\alpha(\lambda)L} \quad \text{Eq.(1)}$$

Where $P_1(\lambda)$ is the measured beam radiant power,

$P_o(\lambda)$ is the initial beam radiant power, and

L is the optical path length.

The beam attenuation coefficient is the sum of the absorption coefficient $a(\lambda)$ and the scattering coefficient $s(\lambda)$ which is defined by [7]:

$$\alpha(\lambda) = a(\lambda) + s(\lambda) \quad \text{Eq.(2)}$$

The scattering phenomenon is negligible because of the dependence of scattering on wavelength. With a given size of particles, long waves would be expected to be less effectively scattered than short ones, because the particles present obstructions to the waves which are smaller compared with the wavelength for long waves than short ones [8]. Then

$$\alpha(\lambda) = a(\lambda) \quad \text{Eq.(3)}$$

When a beam of light is passed through matter in the solid, liquid or gaseous state, its propagation is affected in two important ways. In the first way, the intensity will always decrease to a greater or less extent as the light penetrates farther into the medium. In the second way, the velocity will be less in the medium than in free space. The loss of intensity is chiefly due to absorption. Then absorption is a way of interaction of the electromagnetic radiation with matter, energy absorbed and transformed to other type, the absorption coefficient ($\alpha(\lambda) \text{ cm}^{-1}$) is a property of matter [8].

The observed power is converted to a specific absorption coefficient by using the following formula [7]

$$\alpha = \frac{-\ln[(P/A)/(P_o/A_o)]}{L} \quad \text{Eq.(4)}$$

where P is the measured beam power after sample (mW),

P_o is the incident beam power before sample (mW),

A is the spot area of beam after sample,

A_o is the spot area of beam before sample, and

L is the length of the cuvette (cm).

Resulting from short distance between the container of sample (cuvette) and power meter, then $A = A_o$. Therefore,

$$\alpha = \frac{-\ln[P/P_o]}{L} \quad \text{Eq.(5)}$$

The transmitted beam is defined by [7]

$$T(\lambda) = \frac{P(\lambda)}{P_o(\lambda)} \quad \text{Eq.(6)}$$

and the absorption coefficient becomes as:

$$\alpha = \frac{1}{L} \ln \frac{1}{T(\lambda)} \quad \text{Eq.(7)}$$

VI. EXPERIMENTAL SET UP

The essential components in the setup includes: light source (green laser), a precision glass cuvette as the blood container, and a power meter as shown in Fig. 3

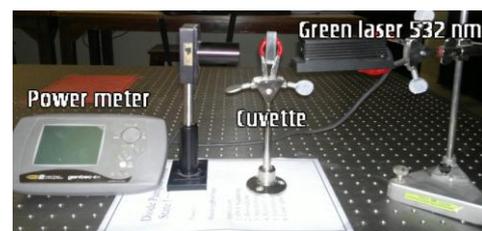

Fig.3 Experimental setup

An Nd: YAG laser (second harmonic generation) with a wavelength of $\approx 532 \text{ nm}$ and the measured output power was about $\approx 52.5 \text{ mW}$ as the light source. When a green laser light passed through some samples of blood container the concentration of bilirubin in blood was determined. Initially, the container was filled by a sample of blood containing a standard bilirubin level and then by sample of blood containing unknown levels of bilirubin. For each case, the output power would be measured and calculated by using equations (6) and (7). Its attenuation which was occurred where laser light passing through the sample of blood.

Spectrophotometer was used to measure the absorption coefficient of human blood as a function of wavelength when the cuvette is filled with a sample contains a standard bilirubin level and the result as shown in Fig 4.

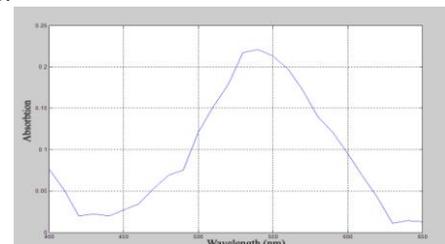

Fig.4 Absorption curve of human blood as a function of wavelength

From Fig.4 the maximum absorption coefficient occurs at range 530-540 nm which has value closely to absorption occur at 532 nm. Therefore a second harmonic generation Nd: YAG laser of 532nm was used.

The samples of blood are dissolved with reagent material because of the normal blood is heavy and the laser cannot be able to pass through it, these reagent material cause an amplification of bilirubin molecules

resulting in dominance of bilirubin molecules on other molecules substances involved in human blood.

The sample work solution by mix 20R1 (sulfanilic acid 30mmol/l, hydrochloric 150mmol/l, dimethylsulfoxide 7mmol/l) volume with 1R3 (sodium nitrite 20mmol/l) volume and R4 represent the standard concentration of bilirubin which its equal 83 μmol/l, then added to the sample. The color of the work solution change to the violet which represent the (test) and when the reagent R1 was added alone to the same sample then the solution color became yellow which represent the (blank). These results of work solution as shown in Fig.5

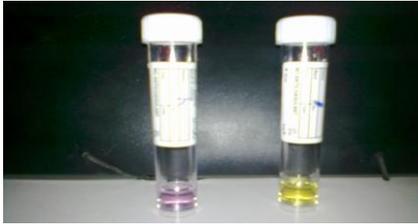

Fig.5 Preparation of sample for measurement

VII. Calculations And Measurements Results

In this work, the concentrations of bilirubin in human blood for all samples were measured by two methods; the first one is the medical laboratory measurements and the other one is the optical activity method using SHG Nd:YAG laser of measured power about 52.5mW.

The concentration of total bilirubin of human blood can be calculated using the below empirical equation:

$$Concentration = \frac{\alpha_{Sample}}{\alpha_{Standard}} \times C_{Standard} \quad Eq.(8)$$

Where

$\alpha_{Standard}$ is the measured absorption coefficient of standard sample = 0.434 cm⁻¹, C Standard is the standard concentration of total bilirubin of human blood = 83mg/dl.

The range of the total bilirubin concentrations of blood is about (0.2 -1) mg/dl. Four samples of adults and five samples of babies were taken in this work.

The experiment recording reading of power meter and the medical tested of the concentration of adults samples are shown in table I and figures 6a and 6b using equation (8).

TABLE I

ILLUSTRATE RECORDING POWER AS A FUNCTION OF THE CONCENTRATION OF BLOOD SAMPLES FOR ADULTS

Absorbed power (mw)	Transmitted Power (mw)	Concentration (mg/dl) of samples for adults		Error rate %
		Experimental measurement	Medical laboratory measurement	
14.15	38.35	3.533	3.589	1.5
19.75	32.75	5.308	5.384	1.4
28.02	24.48	8.132	8.256	1.5
3.98	48.52	0.886	0.9	1.5

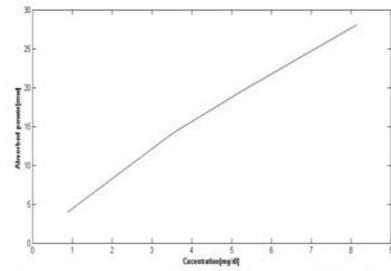

Fig.6a Absorbed power as a function of concentrations (for adults)

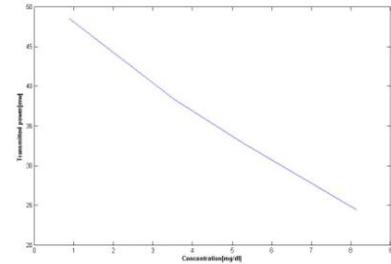

Fig.6b Transmitted power as a function of the concentration (for adult)

From table I, the error rate between experiment results and medical tested of blood samples was about 1.5% and it is acceptable value.

For sample of babies, the error rate was about 2% and the measurement results are shown in table 2 and figures 7a and 7b using equation (8).

TABLE II

ILLUSTRATE RECORDING POWER AS A FUNCTION OF THE CONCENTRATION OF BLOOD SAMPLES FOR BABIES.

Absorbed power (mw)	Transmitted Power (mw)	Concentration (mg/dl) of samples for Babies		Error rate %
		Experimental measurement	Medical laboratory measurement	
21.37	31.13	5.879	5.983	1.7
24.76	27.8	7.152	7.323	0.2
41.6	10.9	17.685	17.973	1.6
27.7	24.8	8.436	8.56	1.4
29.4	23.1	9.235	9.4	1.7

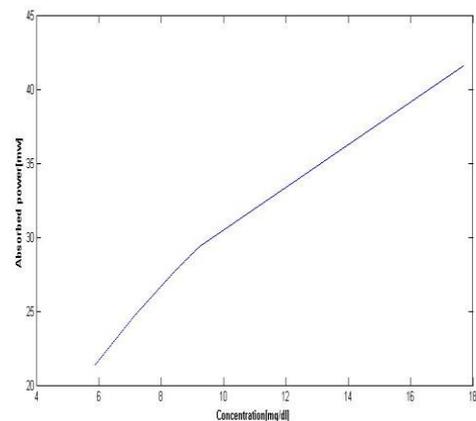

Fig. 7a Absorbed power as a function of the Concentration (for Babies)

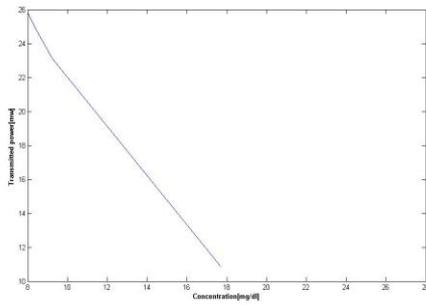

Fig.7b Transmitted power as a function of the Concentration (for Babies)

Figures (8 a, b) show a transmitted power for adults and babies samples as a function of the concentrations of bilirubin measured by two methods

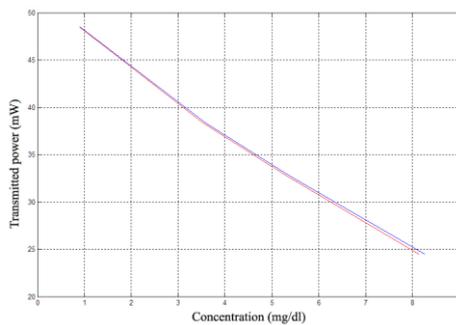

Fig.8a Variations of concentration of bilirubin measured by medical laboratory and concentration measured experimentally (for Adults)

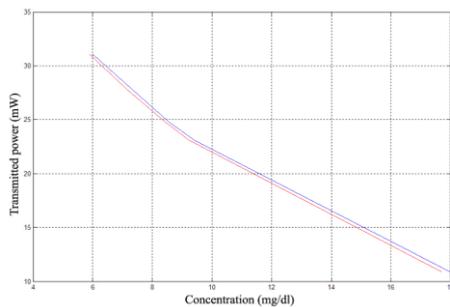

Fig. 8b Variations of concentration of bilirubin measured by medical laboratory and concentration measured experimentally (for Babies)

VIII. CONCLUSIONS

- 1- A good matching occurs between the experimental measurements and medical laboratory tested of a human blood samples contained bilirubin.
- 2- The results demonstrate the ability of the power meter to be accurately measure bilirubin concentrations in blood. This method represents an important step toward the development of a noninvasive bilirubin sensor that may eventually be capable of detecting bilirubin levels in the blood.
- 3- The error (2%) result from the existence of human blood several type of molecules substances, imperfect environment of experimental work, the variation of wavelength for laser used and the peak absorption wavelength and the very small variation of both spot area of laser beam before and after the cuvette which assumed to be equal.

Abstract: Reversible (lossless) data embedding (hiding) has drawn lots of interest recently. Being reversible, the original cover content can be completely restored. This paper proposes a novel reversible data hiding scheme with a lower computational complexity and can be used in applications where both the image and the hidden information is highly confidential. It consists of three phases –AES image encryption, data embedding and data extraction/image-recovery phases. Here, the encrypted image is made highly secured by using an AES (Advanced Encryption standard) stream cipher. Although a data-hider does not know the original image content, he can embed additional data into the encrypted image using the data hiding key. A receiver may firstly decrypt the encrypted image using the encryption key. This decrypted image is similar to the original image. With the data-hiding key, the embedded data can be correctly extracted while the original image can be perfectly recovered.

Index Terms: AES encryption – Data Embedding – Image Recovery.

I. INTRODUCTION

Data hiding is a technique that is used to hide information in digital media such as images, audio, video etc. The information that is hidden depends upon the purpose of application. Owing to data hiding, some distortion may occur in the original cover medium and cannot be inverted back to the original medium. Such a data hiding is called lossy data hiding. But in applications such as medical image system, law enforcement, remote sensing, military imaging etc it is desired to recover the original image content with greater accuracy for legal considerations. The data hiding scheme that satisfies this requirement is called reversible or lossless data hiding. Reversible data hiding was first proposed for authentication and its important feature is reversibility. It hides the secret data in the digital image in such a way that only the authorized person could decode the secret information and restore the original image. Several data hiding methods have been proposed. The performance of a reversible data embedding algorithm is measured by its payload capacity, complexity, visual quality and security. Earlier methods have lower embedding capacity and poor image quality. As the embedding capacity and image quality improved, this method became a covert communication channel. Not only should the data hiding algorithm be given importance. The image on which the data is hidden should also be highly secured.

In this paper, both the cover image and the secret data are given equal importance. The visual quality after encryption as well as the PSNR is also improved. It consists of three phases – AES image encryption, data embedding and data extraction/image-recovery phases. In the first phase, the data of original image are entirely encrypted by an AES (Advanced Encryption standard) stream cipher. The data encryption standard (DES) is weak due to smaller key size, 56 bit. Whereas AES can use three different key sizes: 128, 192 and 256 bits. In the second phase, although a data-hider does not know the original image content, he can embed additional data into the encrypted image by modifying a part of encrypted data using the data hiding key. In the third phase, a receiver may firstly decrypt the encrypted image containing the embedded data using the encryption key. This decrypted image is similar to the original image. With the data-hiding key, the embedded data can be correctly extracted while the original image can be perfectly recovered.

II. EXISTING METHODS

In Difference Expansion method [1], the differences between two adjacent neighboring pixels are doubled to generate a new least significant bit where the new data is hidden providing large information package. In Generalized DE based method [2], Tian's pixel-pair difference expansion was extended using difference expansion of vectors. In Generalized LSB method [3], the cover image undergoes lossless compression to create a space where the new data is added. Thus the PSNR is reduced. In Histogram shift mechanism [4], the pixel values at the zero and the peak points of the histogram are modified to add the new data. In wavelet technique and sorting [5], Kamstra *et al.* improved the location map by sorting possible expandable locations. In integer-to-integer wavelet transform method [6], LSB substitution and bit shifting was done to add new data to the wavelet coefficients obtained from integer-to-integer wavelet transform. In [7], Wang *et al.* uses 2-D vector maps in the cover image. In [8], Thodi *et al.* made better use of redundancy of neighbouring pixels by using payload independent overflow location map. But the compressibility is undesirable in some image types. In [9], Hu *et al.* solved the problem in [8] by constructing an efficient payload dependent overflow location map which has good compressibility. In [10], Hong *et al.* proposes the method of orthogonal projection and modifies the prediction error values to add the secret data. In [11], the data is hidden by modifying a part of the encrypted

image. But the encrypted image is not highly secured and also the PSNR value is low.

III. PROPOSED SCHEME

Figure 1 shows the block diagram of the proposed scheme. There are three phases – AES image encryption, data embedding and data extraction / image-recovery phases.

AES Image Encryption

The original image is in uncompressed format. Firstly, if the image is a colour image, then encrypt each red, green and blue channels otherwise convert it into a gray scale image with each pixel value ranging in between [0-255] represented by 8 bits and then encrypt the image. The pixel bits are represented as $b_{i,j,0}, b_{i,j,1}, \dots, b_{i,j,7}$.

AES is a substitution-permutation network, which is a series of mathematical operations that uses substitutions and permutations such that each output bit depends upon every input bit. The AES algorithm consists of a set of processing steps repeated for a number of iterations called rounds. The number of rounds depends upon the key size. Each round is a cipher with four operations except the last round which is having only three operations. First, AddRoundKey step is performed where the incoming data and the key are added together. Then it performs the round operation. Figure 2 shows the operations in each round [12].

SubByte: each byte of the block is replaced by its substitute in the substitution box(S-box).

ShiftRow: bytes in last three rows are cyclically shifted

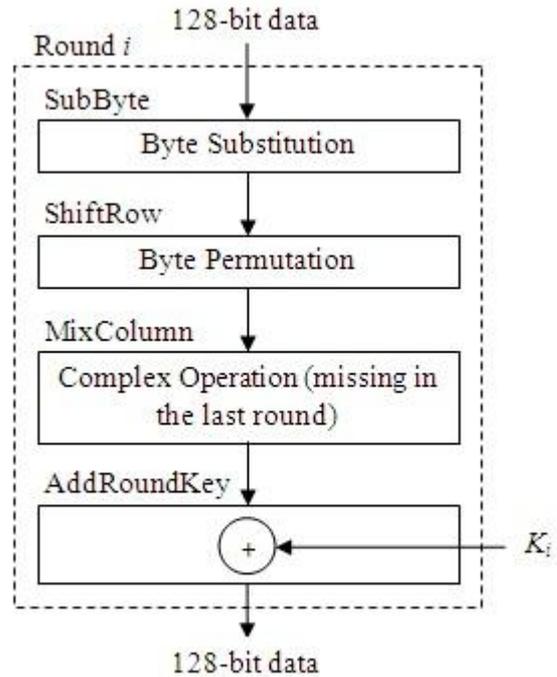

Figure 2. AES Encryption

Data Embedding

In this phase, even though a data hider doesn't know the original content of the image he can embed the secret data into the encrypted image by modifying a small part of the encrypted image.

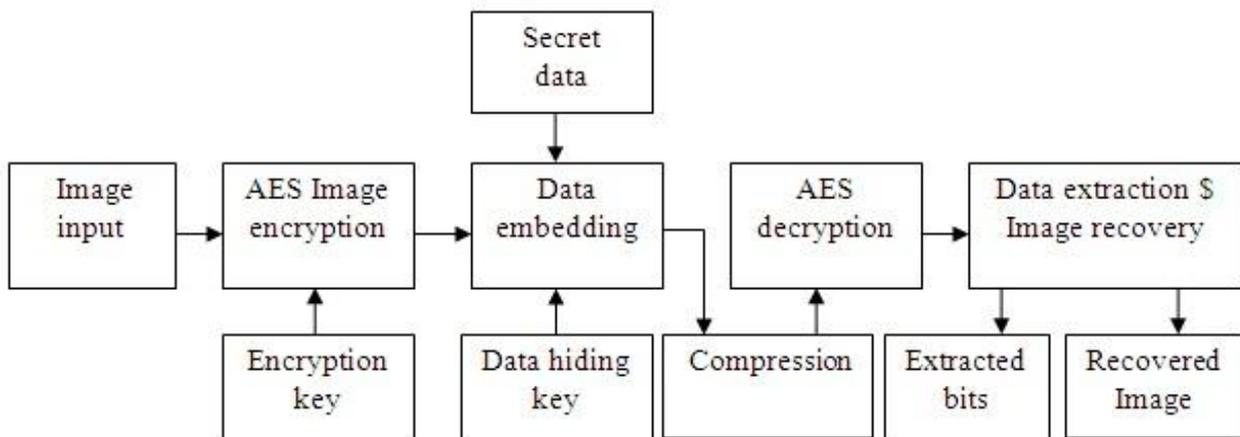

Figure 1. Block Diagram

left over different number of offsets.

MixColumn: Each column is multiplied with a known matrix. Multiplying by 1 means leaving unchanged, by 2 means shifting byte to the left and by 3 means shifting to the left and then performing XOR with the initial unshifted value.

AddRoundKey: XOR with the actual data and the subkey. In final round there is no MixColumn step. These steps are done for 10 rounds. Thus it becomes difficult for the attacker to obtain any information about the original content from the encrypted image.

Firstly, the encrypted image is divided into several segments of block size $s \times s$. Each block is then used to carry one bit. The sum total of the pixel values of each block is calculated. It is then compared with a threshold value which is set manually such as to obtain greater PSNR value. The data is then added to the block whose sum of the pixel value is greater than the threshold value by xor-ing the original pixel bits with the secret data. In order to receive the image properly at the receiver, the image is compressed using wavelet transform which is a lossless compression method.

Data Extraction and Image Recovery

In this phase, the image is decrypted using AES decryption. The steps are AddRoundkey, inverse subbyte using inverse S-box, inverse shiftrow where the bits are cyclically shifted towards right, inverse mixcolumn step using inverse P-box, and AddRoundkey.

The average energy of error between the original and decrypted pixel value is,

$$E_A = 1/8 \sum_{u=0}^7 [u - (7 - u)]^2 \quad [1]$$

u is the no. of bits.

PSNR of the decrypted image,

$$PSNR = 10 \log_{10} \frac{255^2}{E_A/2} = 55.11dB \quad [2]$$

The decrypted image is segmented into blocks. The sum total of pixel values of each block is found then. For each block, if this value is greater than the threshold value then the data is hidden in that block and is extracted by xor-ing the original bits with the decrypted bits. Finally combine the extracted bits to obtain the secret data and collect the recovered blocks to form the original image.

IV. EXPERIMENTAL SETUP

Figure 3(a) shows the original cover media used. 3(b) shows the encrypted image. 3(c) shows the decrypted image carrying the secret data and the value of PSNR caused by data embedding is 55.11dB. At last, the embedded data was successfully extracted and the cover image was recovered. Figure 4 shows the PSNR with respect to the data set values.

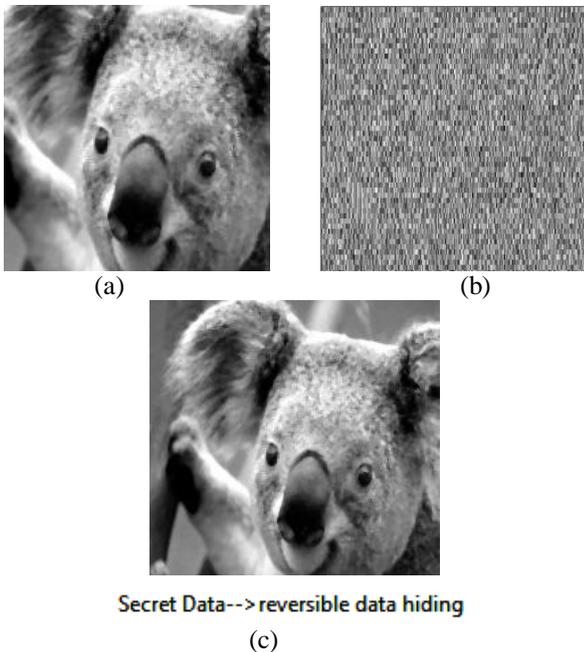

Figure 3. (a) Original image, (b) Encrypted image, (c) Decrypted image with the secret data

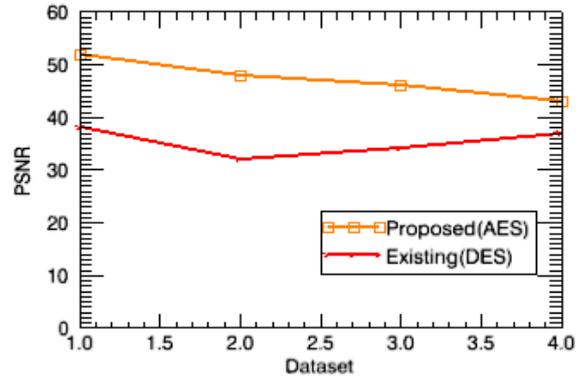

Figure 4. PSNR Vs Data set

V. CONCLUSION

In this work, the cover medium is highly secured for reversible data hiding with lower computational complexity. The data of the original image is completely encrypted by AES stream cipher which overcomes the disadvantages of DES stream cipher. Even though the data hider doesn't know the original content, he can hide the data by modifying a part of the encrypted image. The receiver decrypts the image using AES decryption. The PSNR value of the decrypted image is high. The hidden data is then extracted with the data hiding key and the original image is recovered. This work may be applicable where both the hidden data and the cover media are highly confidential.

VI. ACKNOWLEDGMENT

The authors would like to thank the members of the Dept. of CITE, M S University, Tirunelveli for various algorithms used in this research, and all the people who helped in preparing and carrying out the experiments and data collection.

EDXRF Analysis of Soil Samples to Study the Role of Trace Elements in Optimizing the Yield

Virendra Singh¹, H.M. Agrawal²

^{1,2}Department of Physics, G.B.Pant University, Pantnagar, 263145, India

Abstract : The crops always demand the best composition of soils for them to grow well and so the multielemental study of soil is essential for the betterment of crop production. The EDXRF technique has been used for multielemental analysis of the soil, under study. The soil samples investigated here were treated already with macro, micro and biofertilizers. The concentrations of eight trace elements namely V, Cr, Mn, Fe, Co, Ni, Cu and Zn have been determined in soil samples. The grain yields of wheat and rice crops were obtained and it has been found that the yields depend strongly on the given treatments and the concentrations of the trace elements in the soil. Some of the micronutrients like Zn, Cu, Fe and Mn have shown the major role in the productive yields.

The concentration equations of the eight trace elements as a function of atomic number were fitted using the cubic spline method. The equations may be useful for database purpose and the cross validation can be done in subsequent years to obtain more accurate empirical relation for the studied soil.

Keywords – Cubic Spline Method, EDXRF, Fertilizers, Yield

Introduction

The multi-elemental study of soils is much needed in order to study the role of different elements in plant growth. The data on the concentration of trace elements and metals in soil are valuable for predicting the availability of these elements to plants as well as any toxic effect that might have occur on crops and on their biological activities in soils. The concentrations of micronutrients, e.g. Mn, Cu and Zn in soil are minute in comparison to macro nutrients but they are essential, particularly for cereal crops [1], for proper plants growth and functioning. These micronutrients are also indispensable for humans and animals in minute amount and can be taken through the food chain.

The multielemental analysis of soil samples has been carried out with Energy Dispersive X-Ray Fluorescence (EDXRF) technique. The technique has many advantages over other techniques, like AAS, ICP-MS and chemical methods, that it is multielemental, non-destructive and has better sensitivity and precision. The total concentrations of eight trace elements (V, Cr, Mn, Fe, Co, Ni, Cu and Zn) have been determined in samples which were treated with various fertilizers. In EDXRF, the atoms in the sample material are excited by X-rays, emitted from an X-ray tube. All element specific X-ray fluorescence signals, the intensities of which is proportional to concentration of respective elements, emitted by the atoms after the photoelectric ionization are measured simultaneously by detector.

In case of soil analysis, EDXRF probe has been used in last decade by researchers and scientists for various purposes of study. Multielemental analysis of soil has been done to investigate the uptake mechanism in the herbal drugs [2]. Yu et al. [3] determined the multielemental profile of Hong Kong soils using energy dispersive X-ray fluorescence (EDXRF). The distribution of soil nutrients with depth was studied to understand the importance of plants in structuring the vertical distributions of the nutrients [4].

The empirical relations of elemental concentrations were obtained by fitting the curve using cubic spline method. The concentrations of elements, as a function of atomic number, were given by a set of equations governed by a single function. Every equation is in the form of cubic polynomial and having four parameters.

Experimental Procedures

2.1 Experimental Site & Soil Taxonomy

The soil samples have been collected from an agricultural field of G.B.Pant University of Agriculture and Technology, Pantnagar, lying in tarai region of Uttarakhand, India. The site is in the foothills of Shiwalik range of Himalayas at 29° N latitude, 79°3' E and an altitude of 283.8 m. It is an Agro ecological sub region - 14.1. Based on physico-chemical and morphological characteristics, the soils of this particular tarai region have been classified as Mollisols. The soil of experiment has subgroup-Aquic hapludoll, Family- Fine Loamy and series-Silty Clay Loam.

2.2 Treatments

Five treatments were being given to soil under study. The soil samples from control field were also investigated. The treatments code and details are given in TABLE 2.

Fertilizer doses (Kg ha⁻¹) used at optimal level (100 % NPK) were based on initial soil tests in terms of nutrients. Quantitatively the doses are given below:

TABLE 1.

Crop	N (kg ha ⁻¹)	P(kg ha ⁻¹)	K(kg ha ⁻¹)
Rice	120	26	37
Wheat	120	26	33

In the treatments, the nitrogen (N), phosphorus (P) and potassium (K) were given in the form of urea [(NH₂)₂CO], phosphorus pentaoxide (P₂O₅) and muriate of potass (KCl) respectively.

2.3 Sample Collection and Preparation

The soil samples have been collected from 0-25 cm depth. The samples were air dried, sieved and crushed homogeneously. A 200 mg sample is used to make the pellet by press pelletizer applying the pressure of 150 Kg/cm². A 13 mm die was used to make the pellets.

2.4 Soil Sample Analysis

Jordan Valley EX-3600 EDXRF spectrometer was used to carry out all the measurements under vacuum condition. All the samples were analyzed in three replicates for better results. The inbuilt ExWin software was used for the quantitative analysis.

2.5 Cubic Spline Method

The method was used to fit the curve drawn by data points of concentration vs. Atomic number (Z). The condition for a cubic spline fit is that a set of cubics is passed through the points, using a new cubic in each interval. Briefly the method is discussed here:

The cubic for *i*th interval, which lies between the points (x_i, y_i) and (x_{i+1}, y_{i+1}) would be

$$y = a_i(x - x_i)^3 + b_i(x - x_i)^2 + c_i(x - x_i) + d_i \quad (1)$$

Since it fits at the two end points of the interval, then:

$$y_i = a_i(x_i - x_i)^3 + b_i(x_i - x_i)^2 + c_i(x_i - x_i) + d_i = d_i \quad (2)$$

and

$$y_{i+1} = a_i(x_{i+1} - x_i)^3 + b_i(x_{i+1} - x_i)^2 + c_i(x_{i+1} - x_i) + d_i$$

$$= a_i h_i^3 + b_i h_i^2 + c_i h_i + d_i \quad (3)$$

Where $h_i = \Delta x_i$ is the *i*th interval

Let S_i represents the second derivative at the point (x_i, y_i). Differentiating (1) by two times and equating the slopes and curvature of joining polynomials, we get the values of parameters. Substituting the values of *a*, *b*, *c* and *d* in terms of *S* and *y*, finally we got the relation:

$$h_{i-1}S_{i-1} + (2h_{i-1} + 2h_i)S_i + h_iS_{i+1} = 6 \left(\frac{y_{i+1} - y_i}{h_i} - \frac{y_i - y_{i-1}}{h_{i-1}} \right) \quad (4)$$

(4) applies at each interval point from *i*=2 to *i*=*n*-1, *n* being the total number of points. So we get *n*-2 equations. Two more equations will be obtained by taking linear extrapolation of S₁ with S₂ and S₃, with analogous linearity of S_{*n*}, S_{*n*-1} and S_{*n*-2}:

$$\frac{S_2 - S_1}{h_1} = \frac{S_3 - S_2}{h_2}, \quad h_2S_1 - (h_1 + h_2)S_2 + h_1S_3 = 0 \quad (5)$$

and

$$\frac{S_n - S_{n-1}}{h_{n-1}} = \frac{S_{n-1} - S_{n-2}}{h_{n-2}}, \quad h_{n-1}S_{n-2} - (h_{n-2} + h_{n-1})S_{n-1} + h_{n-2}S_n = 0 \quad (6)$$

Finally, we have a set of data which are fitted throughout by a single cubic.

Results and Discussion

The concentrations of elements, determined by EDXRF technique, are presented in TABLE 3. Arithmetic mean and arithmetic standard deviation (ASD) of concentrations have been calculated also.

The Vanadium was found in bit high amount in the T1 and T2 samples, which were treated with NPK fertilizers. Both V and Cr are poorly soluble and the use of FYM seems to improve the uptake of both of the elements. The usefulness of Cr and V is limited for the plants but these elements were illustrated as essential for the humans [5]. A similar trend was observed for iron and manganese concentration values. Added weedicides and Zn increased the uptake of Fe and Mn as shown by the decreasing concentrations in T1, T2 and T3. This result was also supported by Singh and Nand Ram [6] who studied the uptake of Fe, Mn, Cu and Zn micronutrients for same soil samples and treatments, and observed the highest uptake for T4 treatment (i.e. 100 % NPK+FYM) with decreasing order as T4 > T3 > T2 > T1 > T5 > C. In all the soil samples, the Fe concentration was found to be high and this humid sub-tropical region was considered to be the Fe rich region. Despite the higher amount of iron in soil, no symptoms of iron toxicity have been monitored in the rice and wheat plants. The reason is that the iron toxicity occurs in soils high in active iron and potential acidity (mostly Ultisols, Oxisols, and acid sulfate soils) and not in Mollisols. Besides that, the application of nutrients such as P, K, and Zn reduce iron toxicity, improve growth, and increase rice yield [7]. A least amount of all trace elements and also the poor crop grain yields was observed in T5, i.e. soil treated with biofertilizers. Application of azolla biofertilizer has been found to improves the properties of soil but these improvements were considerable only for nitrogen, organic matter and other cations (Mg, Ca and Na) released into the soil [8]. Cobalt was in quite high amount in all the samples and that could be due to the high amount of Co in the ground water used for irrigation or/and pesticides used here.

The Ni and Cu concentrations were found in a low amount in all the soil samples; although the role of nickel is not clear in the growth of rice and wheat plants. Cu, Mn, Fe and Zn were considered the most essential trace elements for rice and wheat crop and proper fertilizer should be chosen to prevent the deficiency of these elements [9]. Cu concentration and Cu uptake both were highest for T4 sample; indicated that the Cu is highly associated with OM which is the main content of FYM [10]. The second most considerable results were obtained by the addition of Zn concerning the plants growth and yield. The highest and almost same concentration of Zn was obtained for T3 and T4 treatments. It may be concluded by results that along with Cu, significant amount of zinc is also contained with FYM.

The graphs of yields of rice and wheat grain vs. years have been plotted (Fig.1 to Fig.6). The best grain yield of Rice and Wheat is obtained for the treatment T4 (Fig. 4). Addition of FYM with 100% NPK have offered the superior crop production with a higher uptake of micronutrients. FYM is consist of 26.38 % Organic matter which is one of the main soil parameter governing the processes of sorption and desorption of trace elements [11]. The yield of rice and wheat has been increased also

in the subsequent years by the adding FYM. Addition of Zn has clearly enhanced the grain yields of both rice and wheat by substantial amount. A slightly better yield was obtained by adding biofertilizers in soil (Fig. 5) compared to control (Fig. 6). The use of biofertilizers with Zn or FYM could be a better option.

The empirical relations, for concentrations values as a function of atomic number, have been obtained.

If the concentration (in $\mu\text{g/g}$) is denoted by $C(Z)$, the equations of $C(Z)$ as a function of atomic numbers are:

$$\begin{aligned}
 C(Z) &= 0.7780709925 \times 10^8 - 0.1016150467 \times 10^8 + 442082.2227 Z^2 - 6406.988733 Z^3, \text{ for } Z = 23 \\
 &= -0.4591923012 \times 10^9 + 0.5696341861 \times 10^8 Z - 0.2354789657 \times 10^7 Z^2 + 32438.45405 Z^3, \text{ for } Z = 24 \\
 &= \\
 &0.1102960231 \times 10^{10} - 0.1304948853 \times 10^9 Z + 0.5143542504 \times 10^7 Z^2 - 67539.30812 Z^3, \text{ for } Z = 25 \\
 &= -0.1277355453 \times 10^{10} + 0.1441569241 \times 10^9 Z - 0.5419988627 \times 10^7 Z^2 + 67890.57818 Z^3, \text{ for } Z = 26 \\
 &= \\
 &0.7165788765 \times 10^9 - 0.7739133459 \times 10^8 Z + 0.2785502433 \times 10^7 Z^2 - 33411.78057 Z^3, \text{ for } Z = 27 \\
 &= \\
 &-0.2099348092 \times 10^9 + 0.2187798883 \times 10^8 Z - 759830.5453 Z^2 + 8794.564393 Z^3, \text{ for } Z = 28 \\
 &= \\
 &0.4761506567 \times 10^8 - 0.4765101657 \times 10^7 Z + 158896.7127 Z^2 - 1765.519030 Z^3, \text{ for } Z = 29 \text{ \& } Z = 30
 \end{aligned}$$

(7)

Generally it is not so easy to fit the data points which have large variations in the values and less in number, as the case here. To fit a smooth curve to such data points, the cubic spline method is a better approach. The method covers all data points and the fitted curve will be discontinuous on intermediate points.

The (7) were fitted well with the experimental values of concentrations of different elements (TABLE 4). More research in later years may be done to obtain the more accurate empirical relations. Moreover, after creating a database of subsequent years, the variation trends of elemental concentrations may also be studied.

Conclusion

Soil composition for trace elements depends strongly on the given fertilizers treatments and fertilizers concentration. EDXRF is competent technique for analyzing the soil like complex material. Application of farmyard manure (FYM) with 100% NPK has the highest effect on the yield of wheat and rice crops. It also improves the concentrations of some essential trace elements like Cu and Zn in the soil, as confirmed by EDXRF results. The study also pronounces that chemical fertilizers can not be substituted by biofertilizers, concerning plant growth of rice and wheat. Zn has proven to be the most important trace element for rice-wheat cropping system and has a significant role in obtaining higher yield. Except Co, the concentrations of all the trace elements, determined here, in the soil were found to be influenced by the treatments of different fertilizers. The empirical relations obtained by cubic spline method are useful for current and future research purposes.

Protection of Privacy in Distributed Databases using Clustering

Ganesh P.¹, KamalRaj R², Dr. Karthik S.³

^{1,2,3}Department of Computer Science Engineering SNS College of Technology

Abstract: Clustering is the technique which discovers groups over huge amount of data, based on similarities, regardless of their structure (multi-dimensional or two dimensional). We applied an algorithm (DSOM) to cluster distributed datasets, based on self-organizing maps (SOM) and extends this approach presenting a strategy for efficient cluster analysis in distributed databases using SOM and K-means. The proposed strategy applies SOM algorithm separately in each distributed dataset, relative to database horizontal partitions, to obtain a representative subset of each local dataset. In the sequence, these representative subsets are sent to a central site, which performs a fusion of the partial results and applies SOM and K-means algorithms to obtain a final result.

I. Introduction

In the recent years, there has been an increasing of data volume in organizations, due to many factors such as the automation of the data acquisition and reduced storage costs. For that reason, there has been also a growing interest in computational algorithms that can be used to extracting relevant information from recorded data.

Data mining is the process of applying various methods and techniques to databases, with the objective of extract information hidden in large amounts of data. A frequently used method is cluster analysis, which can be defined as the process of partition data into a certain number of clusters (or groups) of similar objects, where each group consists of similar objects amongst themselves (internal homogeneity) and different from the objects of the other groups (external heterogeneity), i.e., patterns in the same cluster should be similar to each other, while patterns in different clusters should not [1].

More formally, given a set of N input patterns:

$X = \{x_1, \dots, x_N\}$, where each $x_j = (x_{j1}, \dots, x_{jp})$ represents a p -dimensional vector and each measure x_{ji} represents a attribute (or variable) from dataset, a clustering process attempts to seek a K partition of X , denoted by $C = \{C_1, \dots, C_K\}$, ($K \leq N$). Artificial neural networks are an important computational tool with strong inspiration neurobiological and widely used in the solution of complex problems, which cannot be handled with traditional algorithmic solutions [13]. Applications for RNA include pattern recognition, signal analysis and processing, analysis tasks, diagnosis and prognostic, data classification and clustering.

In some works, they presented a simple and efficient algorithm to cluster distributed datasets, based on multiples parallel SOM, denominated partSOM [5]. The algorithm is particularly interesting in situations where the data volume is very large or when data privacy and security policies forbid data consolidation into a single location.

This work extends this approach presenting a strategy for efficient cluster analysis in distributed databases using SOM and K-means. The strategy is to apply SOM algorithm separately in each distributed dataset, horizontal

partitions of data, to obtain a representative subset of each local dataset. In the sequence these representative subsets are sent to a central site, which performs a fusion of the results and applies SOM and K-means algorithms to obtain the final result.

The remainder of the article is organized as follows: section 2 presents a brief review about distributed data clustering algorithms and section 3 describes the main aspects of the SOM. The proposed algorithm is presented in section 4 describes the methodology. Finally, section 5 presents conclusions and future research directions.

II. Bibliography Review

Cluster analysis algorithms groups data based on the similarities between patterns. The complexity of cluster analysis process increases with data cardinality and dimensionality. Cardinality :- (N , the number of objects in a database) and dimensionality:- (p , the number of attributes). Clustering methods range from those that are Largely heuristic method to statistic method. Several algorithms have been developed based on different strategies, including hierarchical clustering, vector quantization, graph theory, fuzzy logic, neural networks and others. A recent survey of cluster analysis algorithms is presented in Xu and Wunsch [1].

Searching clusters in high-dimensional databases is a non trivial task. Some common algorithms, such as traditional agglomerative hierarchical methods, are improper to large datasets. The increase in the number of attributes of each entrance does not just influence negatively in the time of processing of the algorithm, as well as it hinders the process of identification of the clusters. An alternative approach is divide database into partitions and to perform data clustering each one separately.

Some current applications have so large databases that are not possible to maintain them integrally in the main memory, even using robust machines. Kantardzic[2] points three approaches to solve that problem:

- a) The data are stored in secondary memory and data subsets are clustered separately. A subsequent stage is needed to merge results;
- b) Usage of an incremental grouping algorithm. Each element is individually stored in the main memory and associated to one of the existent groups or allocated in a new group;
- c) Usage of a parallel implementation. Several algorithms work simultaneously on the stored data.

Two approaches are usually used to partition dataset: the first, and more usual, is to divide horizontally the database, creating homogeneous subsets of the data. Each algorithm operates on the same attributes. Another approach is to divide horizontally the database, creating heterogeneous

data subsets. In this case, each algorithm operates on the same registrations, but handle on different sets of attributes.

Some recent works about distributed data clustering include Forman and Zhang [3] that describes a technique to parallel several algorithms in order to obtain larger efficiency in data mining process of multiple distributed databases. Authors reinforce the concern need in relation to reducing communication

Several organizations maintain geographically distributed databases as a form of increasing the safety of their information. In that way, if safety policies fail, the invader has just access to a part of the existent information. Vaidya and Clifton [18] approaches vertically partitioned databases using a distributed K-means algorithm. Jagannathan et al. [11] present a variant of K-means algorithm to clustering horizontally partitioned databases. Oliveira and Zaiane [9] proposed a spatial data transformation method to protecting attributes values when sharing data for clustering, called RBT, that and is independent of any clustering algorithm.

In databases with a large number of attributes, another approach sometimes used is to accomplish the analysis considering only a subset of the attributes, instead of considering all of them. An obvious difficulty of this approach is to identify which attributes are more important in the process of clusters identification. Some papers related with this approach have frequently used statistical methods as Principal Components Analysis (PCA) and Factor Analysis to treat this problem. Kargupta et al. [10] presented a PCA-based technique denominated Collective Principal Component Analysis (CPCA) for cluster analysis of high-dimensional heterogeneous distributed databases. The authors demonstrated concern in reducing data transfers taxes among distributed sites.

Other works consider the possibility to partition attributes in subsets, but considering each one of them in data mining process. This is of particular interest for the maintenance of whole characteristics present in initial dataset. He et al. [12] analyzed the influence of data types in clustering process and presented a strategy that divided the attributes in two subsets, one with the numerical attributes and other with the categorical ones. Subsequently, they propose to cluster separately of each one of the subsets, using appropriate algorithms for each one of the types. The cluster results were combined in a new database, which was again submitted to a clustering algorithm for categorical data.

III. Self-Organizing Map

The self-organizing feature map (SOM) has been widely used as a tool for visualization of high-dimensional data. Important features include information compression while preserving topological and metric relationship of the primary data items [14]. SOM is composed of two layers of neurons, input and output layers. A neighbouring relation with neurons defines the topology of the map. Training is similar to neural competitive learning, but the best match unit (c or BMU) is updated as well as they neighbors. Each input is mapped to a BMU, which has weight vectors most similar to the presented data.

A number of methods for visualizing data relations in a trained SOM have been proposed [17], such as multiple views of component planes, mesh visualization using

projections and 2D and 3D surface plots of distance matrices. The U-matrix method [17] enables visualization of the topological relations of the neurons in an organized SOM. A gradient image (2D) or a surface plot is generated by computing distances between adjacent neurons. High values in the U-matrix encode dissimilarities between neurons and correspond to cluster borders. Strategies for cluster detection using U-matrix were proposed by Costa and Netto [16]. The algorithms were developed for automatic partitioning and labeling of a trained SOM network. The result is a segmented SOM output with regions of neurons describing the data clusters.

IV. Proposed Methodology

Distributed clustering algorithms usually work in two stages. Initially, the data are analyzed locally, in each unit that is part of the distributed database. In a second stage, a central instance gathers partial results and combines them into an overall result.

This section presents a strategy for clustering similar objects located in distributed databases, using parallel self-organizing maps and K-means algorithm. The process is divided in three stages.

- a) Traditional SOM algorithm is applied locally in each one of the distributed bases, in order to elect a representative subset from input data;
- b) Traditional SOM is applied again, this time to the representatives of each one of the distributed bases that are unified in a central unit;
- c) K-means algorithm is applied over trained self-organizing map, to create a definitive result.

The proposed algorithm, consisting of six steps: step 1 applies local clustering in each local dataset (horizontal parties from the database) using traditional SOM. Thus, the algorithm is applied to an attribute subset in each of the remote units, obtaining a reference vector from each data subset. This reference vector, known as the codebook, is the self-organizing map trained.

In step 2, a projection is made of the input data on the map in the previous stage, in each local unit. Each input is presented to the trained map and the index corresponding to the closest vector (BMU) present in the codebook is stored in an index vector. So, a data index is created based on representative objects instead of original objects. Despite the difference from the original dataset, representative objects in the index vector are very similar to the original data, since maintenance of data topology is an important characteristic of the SOM.

In step 3, each remote unit sends its index and reference vector to the central unit, which is responsible for unifying all partial results. An additional advantage of the proposed algorithm is that the amount of transferred data is considerably reduced, since index vectors have only one column (containing an integer value) and the codebook is usually much less than the original data. So, reducing data transfer and communication overload are considered by the proposed algorithm.

Step 4 is responsible for receiving the index vector and the codebook from each local unit and combining partial results to remount a database based on received data. To remount each dataset, index vector indexes are substituted by the equivalent value in the

codebook. Datasets are combined juxtaposing partial datasets; however, it is important to ensure that objects are in the same order as that of the original datasets. Note that the new database is slightly different from the original data, but data topology is maintained.

In step 5, the SOM algorithm is again applied over the complete database obtained in step 4. The expectation is that the results obtained in that stage can be generalized as being equivalent to the clustering process of the entire database. The data obtained after the step 4 and that will serve as input in stage 5 correspond to values close to the original, because vectors correspondents in codebook are representatives of input dataset.

In step 6, K-means algorithm is applied over the final trained map, in order to improve the quality of the visualization results.

V. Conclusion

Self-organizing map is neural network concept, unsupervised learning strategy, has been widely used in clustering applications. However, SOM approach is normally applied to single and local datasets. In one of the research work, they introduced partSOM, an efficient strategy SOM-based to perform distributed data clustering on geographically distributed databases.

However, SOM and partSOM approaches have some limitations for presenting results. In this work we join partSOM strategy with an alternative approach for cluster detection using K-means algorithm.

Abstract: OFDM is a multicarrier modulation technique in which a high rate bit stream is split into N parallel bit-streams of lower rate and each of these are modulated using one of N orthogonal sub-carriers. In a basic communication system, the data is modulated onto a single carrier frequency. OFDM is a promising candidate for achieving high data rates in mobile environment because of its multicarrier modulation technique. The available bandwidth is then totally occupied by each symbol. The variations in Time Offset (TO) can lead to inter-symbol-interference (ISI) in case of frequency selective channel. A well known problem of OFDM is its sensitivity to frequency offset between the transmitted and received signals, which may be caused by Doppler shift in the channel, or by the difference between the transmitter and receiver local oscillator frequencies. This carrier frequency offset(CFO) causes loss of orthogonality between sub-carriers and the signals transmitted on each carrier are not independent of each other, which results in inter-carrier interference (ICI).The undesired ICI degrades the performance of the system. ICI mitigation techniques are essential in improving the performance of an OFDM system in an environment which induces frequency offset error in the transmitted signal. In this paper , the focus is on the problem of ICI. We proposed ICI reduction using self cancellation scheme and compared with standard OFDM system. . The simulation of OFDM was done with different digital modulation schemes such as BPSK and QPSK modulation techniques . the performance of the designed OFDM system by finding their bit error rate (BER) for different values of signal to noise ratio (SNR). Later we proposed MIMO diversity technique such as STBC OFDM to enhance the performance of the system by reducing the BER for different values of signal to noise ratio (SNR). BER Analysis for BPSK in Rayleigh channel With two transmit and one receive antenna as well as two transmit and two receive antennas for Alamouti STBC case shows higher performance, which effectively alleviates the effects of ISI and ICI.

Keywords: TO, CFO, ISI, ICI, Doppler shift, Self cancellation, CIR, STBC, BER etc.

1. INTRODUCTION

Orthogonal Frequency Division Multiplexing (OFDM) is a technique in which the total transmission bandwidth is split into a number of orthogonal subcarriers so that a wideband signal is transformed in a parallel arrangement

of narrowband 'orthogonal' signals. In this way, a high data rate stream that would otherwise require a channel bandwidth far beyond the actual coherence bandwidth can be divided into a number of lower rate streams. Increasing the number of subcarriers increases the symbol period so that, ideally, a frequency selective fading channel is turned into a flat fading one. In other words, OFDM handles frequency selective fading resulting from time dispersion of multipath channels by expanding the symbol duration [1]. Very high data rates are consequently possible and for this reason it has been chosen as the transmission method for many standards from cable-based Asymmetric Digital Subscriber Line (ADSL), to wireless systems such as the IEEE 802.11a/g local area network, the IEEE 802.16 for broadband metropolitan area network and digital video and audio broadcasting. The fact that the

OFDM symbol period is longer than in single carrier modulation, assures a greater robustness against Inter-Symbol Interference (ISI) caused by delay spread. On the other hand, this makes the system more sensitive to time variations that may cause the loss of orthogonality among subcarriers thus introducing cross interference among subcarriers. Other possible causes of this loss may be due to frequency or sampling offsets emerging at the local oscillator, phase noise and synchronization errors: the combination of all these factors forms the frequency domain OFDM channel response that can be summarized in an ICI matrix. Estimation of this channel matrix is crucial to maximize performance, but in real world OFDM systems this task can be very tough, since the size of the ICI matrix depends on the number of OFDM subcarriers which can be in the order of hundreds or thousands. Several channel estimation algorithms and methods to obtain ICI cancellation have been reported in the literature in both frequency and time domain: although blind techniques are possible without reduction of Spectrum efficiency, commercial systems include pilot patterns to improve the estimation process. These are exploited for example in [2] where a pilot-symbol-aided estimation in the time domain is proposed. Other approaches tend to exploit some other redundancy in the signal structure. In [3][4], training symbols are used to estimate the frequency offset, in [5] the authors propose to use the cyclic-prefix and then Independent Component Analysis (ICA) is applied to the received subcarriers. In [6] frequency offset estimation is obtained by repeated information symbols. The paper is organized as follows. In Section 2 the OFDM system model and formulation of the OFDM channel in frequency domain is introduced together with the ICI matrix approximation. In

Section 3 the problem due to inter carrier interference is analyzed. In Section 4 the proposed method is described. Section 5 the simulations results are analyzed. Section 6 the MIMO STBC model is introduced and in Section 7 the BER analysis of proposed STBC method is derived and simulated. Finally conclusions and some perspectives are given.

2. SYSTEM MODEL

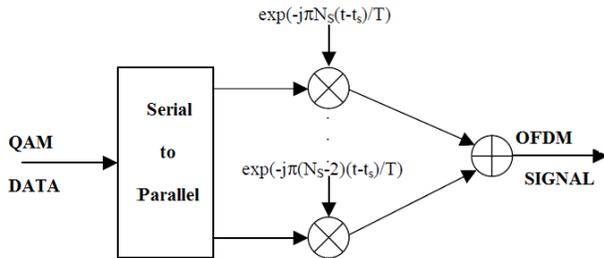

Fig 2.1 OFDM system model

In an OFDM system, the input bit stream is multiplexed into N symbol streams, each with symbol period T, and each symbol stream is used to modulate parallel, synchronous sub-carriers [1]. The sub-carriers are spaced by 1 in frequency, thus they are orthogonal over the interval (0, T).

A typical discrete-time baseband OFDM transceiver system is shown in Figure 2.1. First, a serial-to-parallel (S/P) converter groups the stream of input bits from the source encoder into groups of log₂ M bits, where M is the alphabet of size of the digital modulation scheme employed on each sub-carrier. A total of N such symbols, X_m, are created. Then, the N symbols are mapped to bins of an inverse fast Fourier transform (IFFT). These IFFT bins correspond to the orthogonal sub-carriers in the OFDM symbol. Therefore, the OFDM symbol can be expressed as

$$X(n) = \frac{1}{N} \sum_{m=0}^{N-1} X(m) \exp\left(\frac{j2\pi nm}{N}\right) \text{-----(2.1)}$$

where the X(m)'s are the baseband symbols on each sub-carrier. The digital-to-analog (D/A) converter then creates an analog time-domain signal which is transmitted through the channel.

At the receiver, the signal is converted back to a discrete N point sequence y(n), corresponding to each sub-carrier. This discrete signal is demodulated using an N-point fast Fourier transform (FFT) operation at the receiver. The demodulated symbol stream is given by:

$$Y(m) = \sum_{n=0}^{N-1} y(n) \exp\left(\frac{-j2\pi nm}{N}\right) + W(m) \text{---(2.2)}$$

where, W(m) corresponds to the FFT of the samples of w(n), which is the Additive White Gaussian Noise (AWGN) introduced in the channel.

The high speed data rates for OFDM are accomplished by the simultaneous transmission of data at a lower rate on each of the orthogonal sub-carriers. Because of the low data rate transmission, distortion in the received signal induced by

multi-path delay in the channel is not as significant as compared to single-carrier high-data rate systems. For example, a narrowband signal sent at a high data rate through a multipath channel will experience greater negative effects of the multipath delay spread, because the symbols are much closer together [3]. Multipath distortion can also cause inter-symbol interference (ISI) where adjacent symbols overlap with each other. This is prevented in OFDM by the insertion of a cyclic prefix between successive OFDM symbols. This cyclic prefix is discarded at the receiver to cancel out ISI. It is due to the robustness of OFDM to ISI and multipath distortion that it has been considered for various wireless applications and standards[3].

2.1 DERIVATIONS OF ICI COEFFICIENTS:

say Y_k is the Discrete Fourier Transform of y(n). Then we get,

$$\begin{aligned} Y(k) &= \sum_{n=0}^{N-1} x(n) \exp\left(\frac{j2\pi n\epsilon}{N}\right) \exp\left(\frac{-j2\pi nk}{N}\right) \\ &= \sum_{n=0}^{N-1} \frac{1}{N} \left(\sum_{m=0}^{N-1} X(m) \exp\left(\frac{j2\pi nm}{N}\right) \exp\left(\frac{j2\pi n(\epsilon-k)}{N}\right)\right) \\ &= \frac{1}{N} \sum_{m=0}^{N-1} X(m) \sum_{n=0}^{N-1} \exp\left(\frac{j2\pi n(m+\epsilon-k)}{N}\right) = \frac{1}{N} \\ &\sum_{m=0}^{N-1} X(m) \sum_{n=0}^{N-1} \exp\left(\frac{j2\pi n(m+\epsilon-k)}{N}\right) \text{ (B.1)} \end{aligned}$$

We can expand $\frac{1}{N} \sum_{n=0}^{N-1} \exp\left(\frac{j2\pi n(m+\epsilon-k)}{N}\right)$ using the geometric series as,

$$\begin{aligned} \frac{1}{N} \sum_{n=0}^{N-1} \exp\left(\frac{j2\pi n(m+\epsilon-k)}{N}\right) &= \frac{1}{N} \frac{1 - \exp\left(\frac{j2\pi N(m+\epsilon-k)}{N}\right)}{1 - \exp\left(\frac{j2\pi(m+\epsilon-k)}{N}\right)} \\ &= \left(\frac{1}{N}\right) \frac{\exp\left(\frac{j2\pi(m+\epsilon-k)}{2}\right) \left(\exp\left(-\frac{j2\pi(m+\epsilon-k)}{2}\right) - \exp\left(\frac{j2\pi(m+\epsilon-k)}{2}\right)\right)}{\exp\left(\frac{j2\pi(m+\epsilon-k)}{2N}\right) \left(\exp\left(-\frac{j2\pi(m+\epsilon-k)}{2N}\right) - \exp\left(\frac{j2\pi(m+\epsilon-k)}{2N}\right)\right)} \\ \text{(B.2)} &= \frac{1}{N} \exp\left(j2\pi(m+\epsilon-k)\right) \left(1 - \frac{1}{N}\right) \frac{\text{SIN}\left(\pi(m+\epsilon-k)\right)}{\text{SIN}\left(\frac{\pi(m+\epsilon-k)}{N}\right)} \end{aligned}$$

Substituting (B.2) in (B.1), we get,

$$\begin{aligned} Y(k) &= \sum_{m=0}^{N-1} X(m) S(m-k) \text{ Where ,} \\ S(m-k) &= \exp\left(j2\pi(m+\epsilon-k)\right) \left(1 - \frac{1}{N}\right) \frac{\text{SIN}\left(\pi(m+\epsilon-k)\right)}{\text{SIN}\left(\frac{\pi(m+\epsilon-k)}{N}\right)} \end{aligned}$$

Which are the required ICI coefficients.

3. ANALYSIS OF INTER CARRIER INTERFERENCE

The main disadvantage of OFDM, however, is its susceptibility to small differences in frequency at the transmitter and receiver, normally referred to as frequency offset. This frequency offset can be caused by Doppler shift due to relative motion between the transmitter and receiver, or by differences between the frequencies of the local oscillators at the transmitter and receiver. In this project, the frequency offset is modeled as a multiplicative factor introduced in the channel[10].

The received signal is given by

$$Y(n) = x(n) \exp\left(\frac{j2\pi n\epsilon}{N}\right) + W(n) \text{---(3.1)}$$

where ε is the normalized frequency offset, and is given by ΔfNT . Δf is the frequency difference between the transmitted

and received carrier frequencies and T_s is the subcarrier symbol period. $w(n)$ is the AWGN introduced in the channel.

The effect of this frequency offset on the received symbol stream can be understood by considering the received

$$Y(k) = x(k)S(0) + \sum_{l=0, l \neq k}^{N-1} X(l)S(l-k) + n_k \quad (3.2)$$

where N is the total number of subcarriers, $X(k)$ is the transmitted symbol (M-ary phase-shift keying (M-PSK), for example) for the k subcarrier, is the FFT of $w(n)$, and $S(l-k)$ are the complex coefficients for the ICI components in the received signal. The ICI components are the interfering signals transmitted on sub-carriers other than the k sub-carrier. The complex coefficients are given by

$$S(l-k) = \frac{\sin(\pi(l+\epsilon-k))}{N \sin(\frac{\pi(l+\epsilon-k)}{N})} \exp(j\pi(1-1/N)(l+\epsilon-k)) \quad (3.3)$$

The carrier-to-interference ratio (CIR) is the ratio of the signal power to the power in the interference components. It serves as a good indication of signal quality. It has been derived from (3.2) in [7] and is given below. The derivation assumes that the standard transmitted data has zero mean and the symbols transmitted on the different sub-carriers are statistically independent.

$$CIR = \frac{|s(k)|^2}{\sum_{l=0, l \neq k}^{N-1} |s(l-k)|^2} = \frac{|s(0)|^2}{\sum_{l=0}^{N-1} |s(l)|^2} \quad (3.4)$$

4. ICI SELF-CANCELLATION SCHEME

ICI self-cancellation is a scheme that was introduced by Yuping Zhao and Sven-Gustav Häggman in 2001 in [8] to combat and suppress ICI in OFDM. Succinctly, the main idea is to modulate the input data symbol onto a group of subcarriers with predefined coefficients such that the generated ICI signals within that group cancel each other, hence the name self-cancellation [6].

4.1 ICI Canceling Modulation

The ICI self-cancellation scheme shown in Fig 4.1.1 requires that the transmitted signals be constrained such that $X(1) = -X(0)$, $X(3) = -X(2)$, ..., $X(N-1) = -X(N-2)$. Using (3.3), this assignment of transmitted symbols allows the received signal on subcarriers k and $k+1$ to be written as

$$Y(K) = \sum_{l=0, l \text{ even}}^{N-2} x(l)[S(l-k) - S(l+1-k)] + n_k$$

$$Y(K+1) = \sum_{l=0, l \text{ even}}^{N-2} x(l)[S(l-k-1) - S(l-k)] + n_{k+1} \quad (4.1)$$

and the ICI coefficient $S'(l-k)$ is denoted as

$$S'(l-k) = S(l-k) - S(l+1-k) \quad (4.2)$$

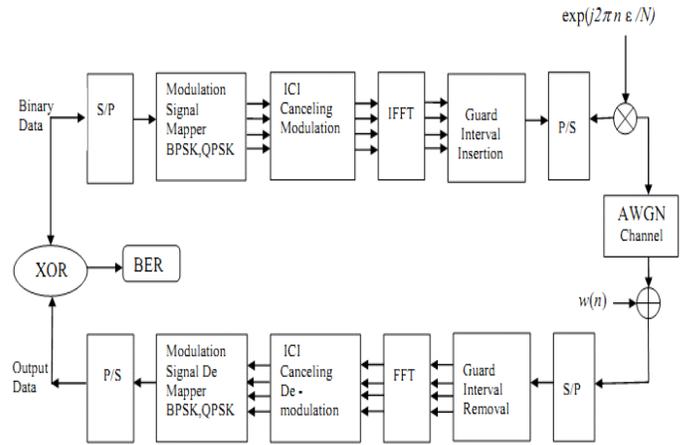

Fig.4.1.1 – OFDM Model with Self cancellation

ICI coefficients $S(l-k)$ Vs subcarrier k is plotted in figure 4.1.2

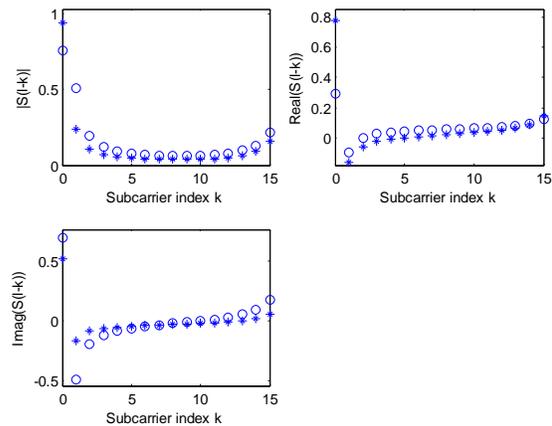

Fig 4.1.2 ICI coefficients $S(l-k)$ Vs subcarrier k

Fig.4.1.3 shows a comparison between $|S'(l-k)|$ and $|S(l-k)|$ on a logarithmic scale. It is seen that $|S'(l-k)| \ll |S(l-k)|$ for most of the $l-k$ values. Hence, the ICI components are much smaller in (4.2) than they are in (3.3). Also, the total number of interference signals is halved in (4.2) as opposed to (3.3) since only the even subcarriers are involved in the summation.

comparison of $|S(l-k)|$, $|S'(l-k)|$, and $|S''(l-k)|$ for $\epsilon = 0.2$ and $N=64$

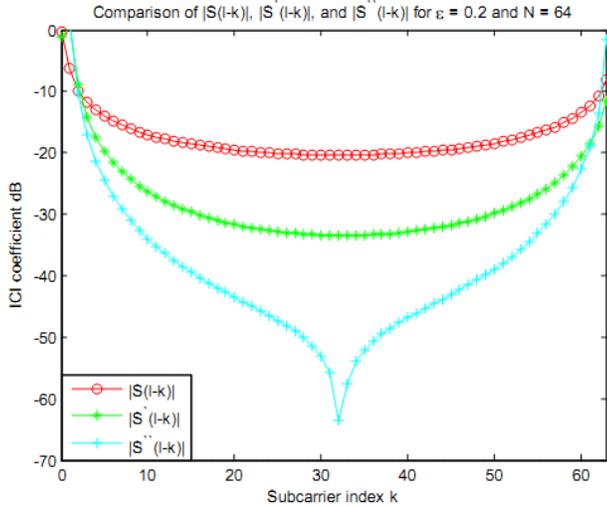

Fig.4.1.3. comparison of S (l-k), S' (l-k) and S''(l-k) Vs subcarrier k

4.2 ICI Canceling Demodulation

ICI modulation introduces redundancy in the received signal since each pair of subcarriers transmit only one data symbol. This redundancy can be exploited to improve the system power performance, while it surely decreases the bandwidth efficiency. To take advantage of this redundancy, the received signal at the (k + 1) subcarrier, where k is even, is subtracted

$$\begin{aligned}
 Y''(k) &= Y'(k) - Y'(k+1) \\
 &= \sum_{l=0, l=even}^{N-2} x(l)[-S(l-k-1)+2S(l-k)-S(l-k+1)] \\
 &\quad + n_k - n_{k+1}
 \end{aligned}$$

Subsequently, the ICI coefficients for this received signal becomes

$$S''(l-k) = -S(l-k-1) + 2S(l-k) - S(l-k+1) \quad \text{---(4.4)}$$

When compared to the two previous ICI coefficients |S(l-k)| for the standard OFDM system and |S'(l-k)| for the ICI canceling modulation, |S''(l-k)| has the smallest ICI coefficients, for the majority of l-k values, followed by |S'(l-k)| and |S(l-k)|. This is shown in Figure 4.1.3 for N = 64 and ε = 0.2. The combined modulation and demodulation method is called the ICI self-cancellation scheme. The reduction of the ICI signal levels in the ICI self-cancellation scheme leads to a higher CIR.

From (4.4), the theoretical CIR can be derived as

$$CIR = \frac{|-s(-1)+2s(0)-s(1)|^2}{\sum_{l=2,4,6}^{N-1} |-s(l-1)+2s(l)-s(l+1)|^2} \quad \text{---(4.5)}$$

Fig. (4.2.1) shows the comparison of the theoretical CIR curve of the ICI self-cancellation scheme, calculated by (4.5), and the CIR of a standard OFDM system calculated by (3.3). As expected, the CIR is greatly improved using the ICI self-cancellation scheme[9]. The improvement can be greater than 15 dB for 0 < ε < 0.5.

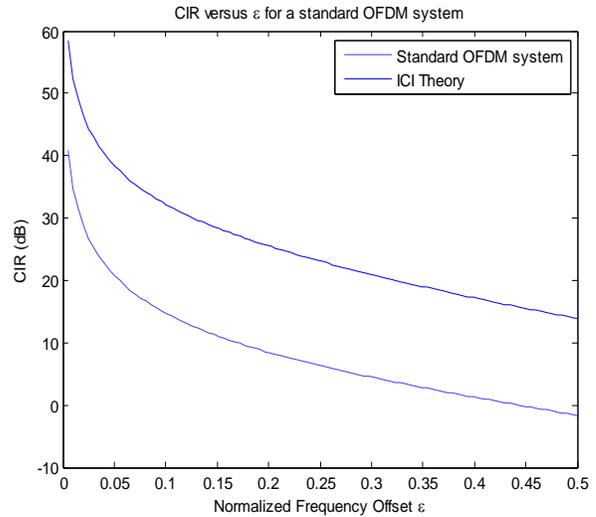

Fig. 4.2.1. CIR Vs Normalized frequency offset

As mentioned above, the redundancy in this scheme reduces the bandwidth efficiency by half. This could be compensated by transmitting signals of larger alphabet size. Using the theoretical results for the improvement of the CIR should increase the power efficiency in the system and gives better results for the BER shown in Fig. 4.2.2.

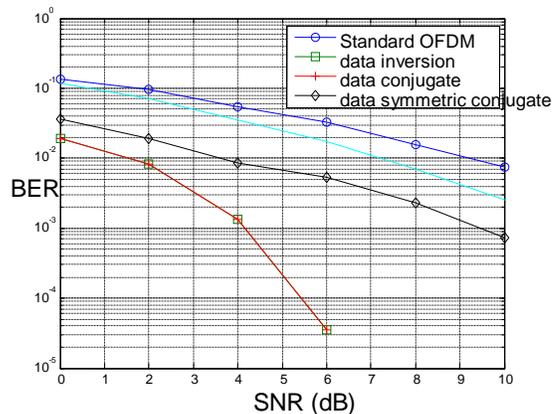

Fig. 4.2.2. BER Vs SNR for an OFDM system

Hence, there is a tradeoff between bandwidth and power tradeoff in the ICI self-cancellation scheme.

5. SIMULATION RESULTS and DISCUSSION

Fig.4.1.1 shows the Fast Fourier transform (FFT) based N-subcarrier OFDM system model used for simulation [1]. The simulation parameters used for the model shown in Figure 4.1 is as given below.

Parameter	Specifications
IFFT Size	64
Number of Carriers in one OFDM Symbol	52
channel	AWGN
Frequency Offset	0,0.15,0.3
Guard Interval	12
Modulation	BPSK,QPSK
OFDM Symbols for one loop	1000

Table 5.1- Simulation Parameters

5.1 BER performance of BPSK OFDM system:

(a) BER performance of a BPSK OFDM system with & without self cancellation :

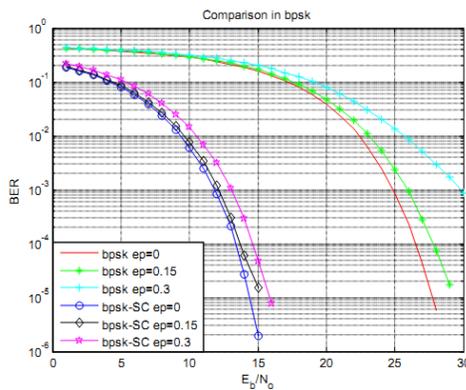

Fig 5.1.1 BER performance of a BPSK OFDM system with & without Self Cancellation

BER performance of a BPSK OFDM system with & without Self Cancellation shown in Fig. 5.1.1. This is the plot which shows the comparison between standard OFDM and OFDM with self cancellation technique for different values of frequency offset for the modulation BPSK. From the figure we observe that as the value of carrier frequency offset ϵ increases, the BER increases. We can infer that self cancellation technique in OFDM has less BER compared to without self cancellation.

5.2 BER performance of QPSK OFDM system

(a) BER performance of a QPSK OFDM system with & without Self Cancellation:

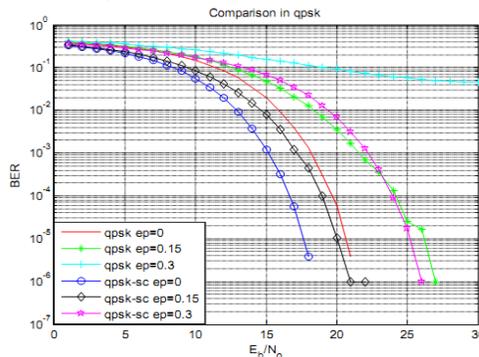

Fig.5.2.1 BER performance of a QPSK OFDM system with & without Self Cancellation

From the Fig. 5.2.1 we observe that as the value of carrier frequency offset ϵ increases, the BER increases. As SNR increases QPSK BER curve leans downward which indicates reduction in bit error rate. This is the plot which shows the comparison between standard OFDM and OFDM with self cancellation technique for different values of frequency offset for the modulation QPSK.

We can infer that self cancellation technique in OFDM has low BER compared to standard OFDM.

(b) BER performances of QPSK, BPSK OFDM systems with constant frequency offsets is simulated in Fig.(5.2.2).

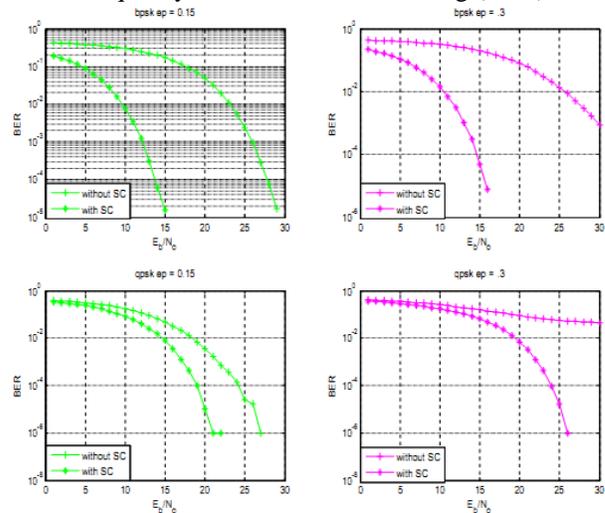

Fig 5.2.2 BER performances of QPSK, BPSK OFDM systems with constant frequency offsets

5.3 Comparison of BER performances of BPSK, QPSK OFDM systems

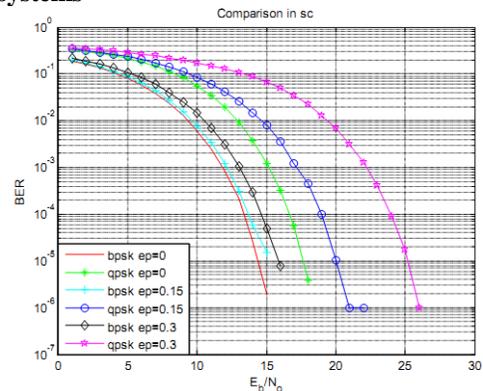

Fig 5.3.1 BER performance of a BPSK, QPSK OFDM systems with Self Cancellation.

This plot shown in Fig.5.3.1. is the comparison between two modulation techniques for different values of frequency offset. Here only self cancellation technique is considered. We notice that as the value of carrier frequency offset ϵ increases, the BER increases. For low frequency offset value BER is less. For constant ϵ value, BER of BPSK is less than BER of QPSK.

6. ALTAMONTE STBC

6.1 Transmitter with Alamouti STBC

Three receive diversity schemes – Selection combining, Equal Gain Combining and Maximal Ratio Combining. All the three approaches used the antenna array at the receiver to improve the demodulation performance, albeit with different levels of complexity. Time to move on to a **transmit diversity**[11] scheme where the information is spread across multiple antennas at the transmitter. Lets discuss a popular transmit diversity scheme called **Alamouti Space Time Block Coding (STBC)**[13]. For the discussion, we will assume that the channel is a flat fading Rayleigh multipath channel and the modulation is BPSK.

A simple Space Time Code, suggested by Mr. Siavash M Alamouti in his landmark October 1998 paper – A Simple Transmit Diversity Technique for Wireless Communication[13], offers a simple method for achieving spatial diversity with two transmit antennas. The scheme is as follows:

1. Consider that we have a transmission sequence, For example $\{x_1, x_2, x_3, \dots, x_n\}$
2. In normal transmission, we will be sending x_1 in the first time slot, x_2 in the second time slot, x_3 and so on.
3. However, Alamouti suggested that we group the symbols into groups of two. In the first time slot, send x_1 and x_2 from the first and second antenna. In second time slot send $-x_2^*$ and x_1^* from the first and second antenna. In the third time slot send x_3 and x_4 from the first and second antenna. In fourth time slot, send $-x_4^*$ and x_3^* from the first and second antenna and so on.
4. Notice that though we are grouping two symbols, we still need two time slots to send two symbols. Hence, there is no change in the data rate.
5. This forms the simple explanation of the transmission scheme with Alamouti Space Time Block coding shown in Fig.6.1.1.

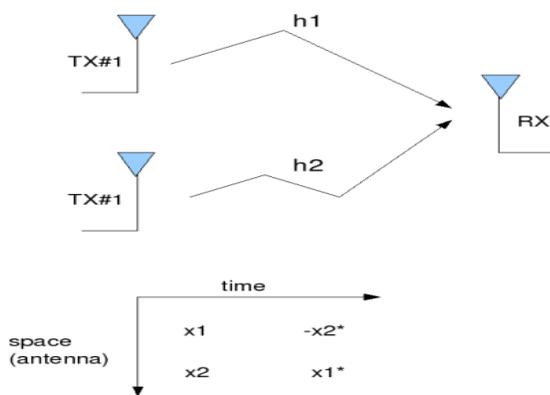

Fig. 6.1.1. Alamouti's 2Tx and 1Rx STBC Scheme

Other Assumptions

1. The channel is flat fading – In simple terms, it means that the multipath channel has only one tap. So, the convolution operation reduces to a simple multiplication.

2. The channel experience by each transmit antenna is independent from the channel experienced by other transmit antennas.

3. For the i^{th} transmit antenna, each transmitted symbol gets multiplied by a randomly varying complex number h_i . As the channel under consideration is a Rayleigh channel, the real and imaginary parts of h_i are Gaussian distributed having mean $\mu_{h_i} = 0$ and variance $\sigma_{h_i}^2 = \frac{1}{2}$.

4. The channel experienced between each transmit to the receive antenna is randomly varying in time. However, the channel is **assumed to remain constant over two time slots**.

5. On the receive antenna, the noise n has the Gaussian probability density function with

$$p(n) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(n-\mu)^2}{2\sigma^2}} \quad \text{with} \quad \mu = 0 \text{ and } \sigma^2 = \frac{N_0}{2}$$

6. The channel h_i is known at the receiver.

6.2 Receiver with Alamouti STBC

In the first time slot, the received signal is,

$$y_1 = h_1 x_1 + h_2 x_2 + n_1 = [h_1 \ h_2] \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + n_1$$

In the second time slot, the received signal is,

$$y_2 = -h_1 x_2^* + h_2 x_1^* + n_2 = [h_1 \ h_2] \begin{bmatrix} -x_2^* \\ x_1^* \end{bmatrix} + n_2$$

Where

y_1, y_2 is the received symbol on the first and second time slot respectively,

h_1 is the channel from 1st transmit antenna to receive antenna,

h_2 is the channel from 2nd transmit antenna to receive antenna,

x_1, x_2 are the transmitted symbols and n_1, n_2 is the noise on 1st, 2nd time slots.

Since the two noise terms are independent and identically distributed,

$$E \left\{ \begin{bmatrix} n_1 \\ n_2^* \end{bmatrix} \begin{bmatrix} n_1^* & n_2 \end{bmatrix} \right\} = \begin{bmatrix} |n_1|^2 & 0 \\ 0 & |n_2|^2 \end{bmatrix}$$

For convenience, the above equation can be represented in matrix notation as follows:

$$\begin{bmatrix} y_1 \\ y_2^* \end{bmatrix} = \underbrace{\begin{bmatrix} h_1 & h_2 \\ h_2^* & -h_1^* \end{bmatrix}}_{\mathbf{H}} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} n_1 \\ n_2^* \end{bmatrix}$$

$$\mathbf{H} = \begin{bmatrix} h_1 & h_2 \\ h_2^* & -h_1^* \end{bmatrix}$$

Let us define

$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$, we know that we need to find the inverse of \mathbf{H}

. We know, for a general $m \times n$ matrix, the pseudo inverse is defined as,

$$\mathbf{H}^+ = (\mathbf{H}^H \mathbf{H})^{-1} \mathbf{H}^H$$

The term,

$$(\mathbf{H}^H \mathbf{H}) = \begin{bmatrix} h_1^* & h_2 \\ h_2^* & -h_1 \end{bmatrix} \begin{bmatrix} h_1 & h_2 \\ h_2^* & -h_1^* \end{bmatrix} = \begin{bmatrix} |h_1|^2 + |h_2|^2 & 0 \\ 0 & |h_1|^2 + |h_2|^2 \end{bmatrix}$$

. Since this is a diagonal matrix, the inverse is just the inverse of the diagonal elements, i.e

$$(\mathbf{H}^H \mathbf{H})^{-1} = \begin{bmatrix} \frac{1}{|h_1|^2 + |h_2|^2} & 0 \\ 0 & \frac{1}{|h_1|^2 + |h_2|^2} \end{bmatrix}$$

The estimate of the transmitted symbol is,

$$\begin{aligned} \begin{bmatrix} \hat{x}_1 \\ \hat{x}_2 \end{bmatrix} &= (\mathbf{H}^H \mathbf{H})^{-1} \mathbf{H}^H \begin{bmatrix} y_1 \\ y_2^* \end{bmatrix} \\ &= (\mathbf{H}^H \mathbf{H})^{-1} \mathbf{H}^H \left(\mathbf{H} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} n_1 \\ n_2^* \end{bmatrix} \right) \\ &= \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + (\mathbf{H}^H \mathbf{H})^{-1} \mathbf{H}^H \begin{bmatrix} n_1 \\ n_2^* \end{bmatrix} \end{aligned}$$

By compare the above equation with the estimated symbol following equalization in Maximal Ratio Combining, we can see that the equations are identical.

6.3 Alamouti STBC with two receive antenna

The principle of space time block coding with 2 transmit antenna . With two receive antenna's the system can be modeled as shown in the Fig.6.3.1. below.

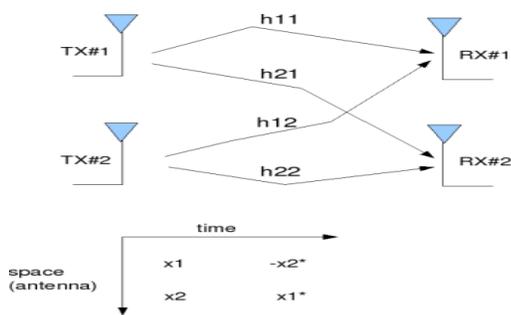

Fig.6.3.1. Transmit 2 Receive Alamouti STBC

The received signal in the first time slot is,

$$\begin{bmatrix} y_1^1 \\ y_2^1 \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} n_1^1 \\ n_2^1 \end{bmatrix}$$

Assuming that the channel remains constant for the second time slot, the received signal is in the second time slot is,

$$\begin{bmatrix} y_1^2 \\ y_2^2 \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} -x_2^* \\ x_1^* \end{bmatrix} + \begin{bmatrix} n_1^2 \\ n_2^2 \end{bmatrix}$$

where

$\begin{bmatrix} y_1^1 \\ y_2^1 \end{bmatrix}$ are the received information at time slot 1 on receive antenna 1, 2 respectively,

$\begin{bmatrix} y_1^2 \\ y_2^2 \end{bmatrix}$ are the received information at time slot 2 on receive antenna 1, 2 respectively, h_{ij} is the channel from i^{th} receive antenna to j^{th} transmit antenna,

x_1, x_2 are the transmitted symbols,

$\begin{bmatrix} n_1^1 \\ n_2^1 \end{bmatrix}$ are the noise at time slot 1 on receive antenna 1, 2 respectively and

$\begin{bmatrix} n_1^2 \\ n_2^2 \end{bmatrix}$ are the noise at time slot 2 on receive antenna 1, 2 respectively. Combining the equations at time slot 1 and 2,

$$\begin{bmatrix} y_1^1 \\ y_2^1 \\ y_2^{2*} \\ y_1^{2*} \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \\ h_{12}^* & -h_{11}^* \\ h_{22}^* & -h_{21}^* \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} n_1^1 \\ n_2^1 \\ n_2^{2*} \\ n_1^{2*} \end{bmatrix}$$

Let us define

$\mathbf{H} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \\ h_{12}^* & -h_{11}^* \\ h_{22}^* & -h_{21}^* \end{bmatrix}$, To solve for $\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$, we know that we need to find the inverse of \mathbf{H} .
 $\mathbf{H}^+ = (\mathbf{H}^H \mathbf{H})^{-1} \mathbf{H}^H$. The term,

$$(H^H H) = \begin{bmatrix} |h_{11}|^2 + |h_{21}|^2 + |h_{12}|^2 + |h_{22}|^2 & 0 \\ 0 & |h_{11}|^2 + |h_{21}|^2 + |h_{12}|^2 + |h_{22}|^2 \end{bmatrix}$$

Since this is a diagonal matrix, the inverse is just the inverse of the diagonal elements, i.e

$$(H^H H)^{-1} = \begin{bmatrix} \frac{1}{|h_{11}|^2 + |h_{21}|^2 + |h_{12}|^2 + |h_{22}|^2} & 0 \\ 0 & \frac{1}{|h_{11}|^2 + |h_{21}|^2 + |h_{12}|^2 + |h_{22}|^2} \end{bmatrix}$$

The estimate of the transmitted symbol is,

$$\begin{bmatrix} \hat{x}_1 \\ \hat{x}_2^* \end{bmatrix} = (H^H H)^{-1} H^H \begin{bmatrix} y_1 \\ y_2 \\ y_2^* \\ y_1^* \end{bmatrix}$$

7. BER analysis with Alamouti STBC

Since the estimate of the transmitted symbol with the Alamouti STBC scheme is identical to that obtained from MRC, the BER with above described Alamouti scheme should be same as that for MRC. However, there is a small catch.

With Alamouti STBC, we are transmitting from two antennas. Hence the total transmits power in the Alamouti scheme is twice that of that used in MRC. To make the comparison fair, we need to make the total transmit power from two antennas in STBC case to be equal to that of power transmitted from a single antenna in the MRC case[14]. With this scaling, we can see that **BER performance of 2Tx, 1Rx Alamouti STBC case has a roughly 3dB poorer performance that 1Tx, 2Rx MRC case.**

From the Maximal Ratio Combining, the bit error rate for BPSK modulation in Rayleigh channel [17]with 1 transmit, 2 receive case is,

$$P_{e,MRC} = p_{MRC}^2 \left[1 + 2(1 - p_{MRC}) \right]$$

$$p_{MRC} = \frac{1}{2} - \frac{1}{2} \left(1 + \frac{1}{E_b/N_0} \right)^{-1/2}$$

where

With **Alamouti 2 transmit antenna, 1 receive antenna STBC case,**

$$p_{STBC} = \frac{1}{2} - \frac{1}{2} \left(1 + \frac{2}{E_b/N_0} \right)^{-1/2} \quad \text{and}$$

Bit Error Rate is

$$P_{e,STBC} = p_{STBC}^2 \left[1 + 2(1 - p_{STBC}) \right]$$

1. There is no cross talk between x_1, x_2 after the equalizer.

2. The noise term is still white.

$$E \left\{ H^H \begin{bmatrix} n_1 \\ n_2^* \end{bmatrix} \begin{bmatrix} n_1^* \\ n_2 \end{bmatrix} H \right\} = H^H \begin{bmatrix} |n_1|^2 & 0 \\ 0 & |n_2|^2 \end{bmatrix} H = \begin{bmatrix} |n_1|^2 & 0 \\ 0 & |n_2|^2 \end{bmatrix} \begin{bmatrix} |h_{11}|^2 + |h_{21}|^2 & 0 \\ 0 & |h_{11}|^2 + |h_{21}|^2 \end{bmatrix}$$

Simulation Model for BPSK in Rayleigh channel With two transmit and one receive antenna:

The Matlab simulation performs the following

- (a) Generate random binary sequence of +1's and -1's.
- (b) Group them into pair of two symbols
- (c) Code it per the Alamouti Space Time code, multiply the symbols with the channel and then add white Gaussian noise.
- (d) Equalize the received symbols
- (e) Perform hard decision decoding and count the bit errors
- (f) Repeat for multiple values of E_b/N_0 and plot the simulation and theoretical results.

The simulation results are as shown in the plot below Fig.7.1.1..

6. CONCLUSION

In this paper, the performance of OFDM systems in the presence of frequency offset between the transmitter and the receiver has been studied in terms of the Carrier-to-Interference ratio(CIR). Inter-carrier interference (ICI) which results from the frequency offset degrades the performance of the OFDM system. The variations in Time Offset(TO) can lead to inter-symbol-interference (ISI) in case of frequency selective channel can be reduced by using cyclic prefix as well as diversity in receiver design. One of the main disadvantages of OFDM is its sensitivity against carrier frequency offset which causes attenuation and rotation of subcarriers, and inter carrier interference (ICI). Orthogonality of the sub-carriers in OFDM helps to extract the symbols at the receiver without interference with each other. This work investigates an ICI self-cancellation scheme for combating the impact of ICI on OFDM systems for different frequency offset values. Different modulation techniques are considered for ICI reduction and compared with each other for their performances. It is also suitable for multipath fading channels. It is less complex and effective. The proposed scheme provides significant CIR improvement, which has been studied theoretically and by simulations. Under the condition of the same bandwidth efficiency and larger frequency offsets, the proposed OFDM system using the ICI self-cancellation scheme performs much better than standard OFDM systems. In addition, In this work we develop a generally applicable equalization technique for space-time block coded (STBC) MIMO orthogonal frequency division multiplexing (OFDM) communication systems. We can observe that the BER performance is much better than 1 transmit 2 receive MRC case. This is because the effective channel concatenating the information from 2 receive antennas over two symbols results in a diversity order of 4. In general, with m receive antennas, the diversity order for 2 transmit antenna Alamouti STBC is $2m$. BER plots for BPSK in Rayleigh channel With two transmit and one receive antenna as well as two transmit and two receive antennas for

Alamouti case are derived and simulated.

7. SCOPE OF FUTURE WORK:

Following are the areas of future study which can be considered for further research work.

1. Coding associated with frequency (among carriers) and time interleaving make the system very robust in frequency selective fading. Hence Channel coding is very important in OFDM systems. COFDM (Coded OFDM) Systems can be used for ICI reduction using self cancellation technique.
2. This self cancellation technique can also be applied under different multipath propagation mobile conditions such as Rayleigh fading channel, urban, rural area channels etc.
3. This self cancellation scheme can be extended to Multiple input and Multiple output (MIMO) OFDM systems for more number of transmitters and receivers..

India in 1994 and He has been honored with PhD in 2003 from J.N.T.U. Hyderabad., Andhra Pradesh, India. Presently he is working as Professor in department of Electronics and Communication at J.N.T.U.A., Anantapur, Andhra Pradesh, India. His research areas are Wireless Communications and Biomedical Instrumentation. He is a member of ISTE, IE & NAFE.

Implementation and Performance Analysis of MIMO Digital Video Broadcasting-T2

A. Ramya¹, Prof. Mrs. B. Devi²

*II- ME (Communication Systems), Assistant HOD/ECE
SNS College of Technology, Coimbatore (dt), Tamilnadu, India*

Abstract: The Digital Video Broadcasting second generation (DVB – T2) system transmitter and receiver are to be implemented and simulated using MATLAB. The existing system uses the Multiple Input Single Output processing unit (MISO) technology as a means of transmission. The proposing system is the implementation of the DVB – T2 system with the support of multiple antenna transmission and multiple antenna reception. Multiple Input Multiple Output–Orthogonal Frequency Division Multiplexing (MIMO-OFDM) is implemented in order to support the multiple antenna transmission and reception. Here MISO processing unit has been replaced by the MIMO processing unit. In DVB-T2 system transmitter section, reduce the peak to average power ratio to make transmission cheaper. DVBT2 also supports service specific robustness levels so that both fixed and portable devices will be used. MIMO systems can deliver both higher data throughput and greater robustness by taking advantage of the additional signal paths between a transmitter and a receiver.

Keywords: DVB, Constellation, Alamouti scheme, MIMO, OFDM.

I. Introduction

Digital Video Broadcasting Terrestrial (DVB – T) is the most popular and successful standard for Digital Terrestrial Television (DTT). For TV broadcasting most of the governments at present are moving to analog switch off. Even though the digital broadcast standards have been available for many years for both terrestrial as well as over satellite and cable, there has not been much benefits in migration for the users. On the other hand the demand for High Definition TV (HDTV) has been increased with the recent changes in television formats. These services are at present already used for delivery over Digital Video Broadcasting-Satellite (DVBS) and over cable. But to achieve it over DVB-T is difficult. The governments and the industries can get attractive possibilities with the usage of new HDTV services and migration from analog to digital. In order to increase the performance of DVB-T services, new opportunities have been provided by the DVB-T2 along with changes in channel coding and encoding compression. Hence without increasing the radio bandwidth HDTV services can be provided. There has been a wide interest all around the world for HDTV services and before now the services have been planned and implemented. The migration of encoding of video streams, the change of multiplexing techniques and the implementation of the new mechanisms in the radio layer is essential in order to make

the services to succeed and also to deliver more digital bandwidth and better forward error recovery. The Digital Video Broadcasting –Terrestrial second generation (DVB-T2) uses the Orthogonal Frequency Division Multiplexing(OFDM) modulation which is similar to the DVB-T system. A toolkit is provided with different numbers of carrier such as 1k, 2k, 4k, 8k, 16k, 32k, 16k and 32k extended modulation constellations such as Quadrature Phase Shift Keying (QPSK), 16-QAM (Quadrature Amplitude Modulation), 64-QAM, and 256-QAM. Bose-Chaudhuri-Hocquengham (BCH) and Low density parity check (LDPC) coding are used by DVB-T2 for the case of error protection. Under certain conditions in order to provide additional robustness a new technique has been introduced called as the Rotated Constellations. DVB-T2 system has proposed with Multiple Input Single Output (MISO) transmission technology which has multiple transmitting antenna and single receiving antenna. Increasing number of users uses the High Definition (HD) television its need better transmission technology that can satisfied the user demands. MIMO (Multiple Input Multiple Output) is one of the technologies which can satisfy. In this MIMO transmission multiple antennas can be used for both transmitting and receiving.

The aim of this project are implementing and simulating the transmitter of DVB – T2 system with integration of MIMO – OFDM and also to reduce the Peak to Average Power Ratio. The MATLAB simulator is going to be used for implementation and simulation of DVB – T2 system with MIMO – OFDM.

II. Dvb-T2 System Architecture

The diagram shown below represents the generic model of the T2 system. The input given to the Pre-processor indicated by TS or GS stands for one or more MPEG-2 Transport streams and one or more Generic streams. From the diagram we can say that the Input Pre-processor is not a part of the T2 system but it contains the Service splitter or the demultiplexer for separating the services of the transport streams into system inputs for the T2. These are then passed on to the individual PLPs (Physical Layer Pipes). The total input data capacity of one T2 frame over its duration should not exceed the total available T2 data capacity.

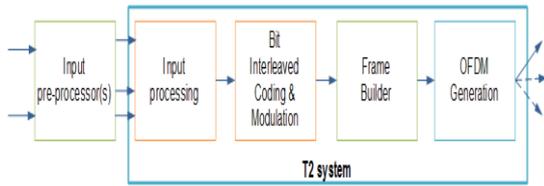

Fig 1: DVB-T2 Architecture block diagram

A.MIMO PROCESSING

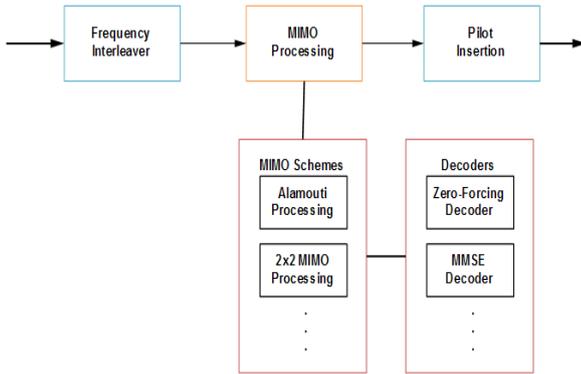

Fig 2: Block of MIMO Processing Unit

The main function of the Alamouti sub block here is to encode the signal along with the Alamouti space time block code. This will work on the OFDM cells. Since the block sends the output to two antennas, we can say that the output data will be twice the size of the input. In the first time slot, transmitter 0 (TX0) sends out s_0 and transmitter 1 (TX1) sends out s_1 . In the second time slot, TX0 sends out $-s_1^*$ and TX1 s_0^* . Here, * denotes the complex conjugate. The Alamouti scheme is a full rate transmission scheme as one unique symbol is transmitted in each time slot.

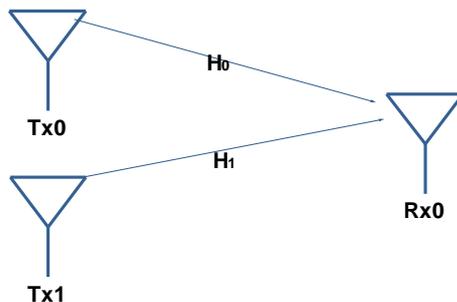

Fig 3: Illustration of Alamouti scheme.

The signals travel through two channels, h_0 and h_1 , to the receiver. The two signals must have a correlation of less than 0.7 and roughly equal transmit powers in order for the scheme to provide diversity gain.

B. PEAK TO AVERAGE POWER RATIO (PAPR) REDUCTION

In order to decrease the PAPR, two modifications are allowed for the transmitted OFDM symbol. The two techniques which are used are the Active Constellation Extension Technique and the Tone Reservation Technique. Both can be used simultaneously. These techniques are used on the active portion of the OFDM symbol excluding P1, and after this the guard intervals are inserted. When

both the techniques are being used simultaneously, the Active Constellation Extension Technique will be used in the first place to the signal. But this cannot be used on the Pilot carriers or the reserved tones or even when the rotated constellations are being used.

III. DVB-T2 RECEIVER

The main function of an MIMO receiver separates the signals received from the transmitter using signatures of the spatial signal. The receiver antenna always receives the combined form the sent signals and the signal should be de-correlated in order to get the original signal. Here we are about to see the different types of receiver architectures and their characteristics. They are the zero forcing receiver, V-BLAST receiver and the maximum likelihood receiver.

A..Zero Forcing Receiver

This is also known as the linear de-correlator. Here the architecture of the receiver is very simple and it gains knowledge from the channel matrix. With this it estimates the sent signal. The estimated signal is calculated from the equation given below.

$$\hat{s} = H^T r$$

Where H value is given by

$$H^T = (H^* H)^{-1} H^*$$

Where H^* is the complex conjugate, it is transpose of the H and r is denoted by the receive signal. One of the main advantages of the zero forcing receivers is that it separates the signals perfectly from the transmitter. But it is only suitable in case where the SNR value is high because it will enhance the noise at low SNR[6].

B.Minimum Mean-Square Error Receiver

Another method called the minimum mean square error also helps in the separating of the co channel signals. It does this by minimising the impact created by co-channel interference and noise present in the received signal. The following equation helps in calculating the the signal estimation,[2]

$$\hat{s} = (H^* H + \alpha^2 I)^{-1} H^* r$$

This receiver is less sensitive to noise and on the other hand does not produce a high separation quality. For high SNR conditions $\alpha^2 \approx 0$ [6].

C.V.Blast Receiver

V-BLAST is abbreviated as the Vertical Bell Labs Space Time Architecture. It works by increasing the computational capability of the receiver comparatively to the minimum mean square receiver and zero forcing receivers. But at the same time it provides a thorough signal separation and the capability of tolerance towards noise. It operates by separating the signals iteratively by order of strength and finally when all the signals have been detected and separated it reconstructs the signals[2].

D. Maximum Likelihood Receiver

This receiver has a better error rate performance than the remaining receivers, but it is as equally complex in its architecture.

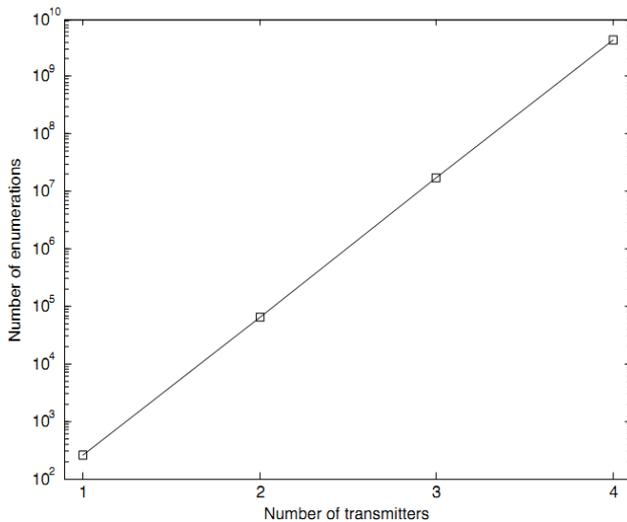

Fig. 4. Maximum Likelihood receiver using 256-QAM modulation showing computational complexity.

The above figure shows the increase in growing of computational complexity by using highest order modulation in the DVB-T2 system which uses 256QAM. The following equation helps in the calculation of the maximum likelihood estimation.

$$\hat{s} = \underset{s}{\operatorname{argmin}} \|r - Hs\|^2$$

It calculates the minimum over all possible code word vector s , and this in turn leads to the computational complexity as with the increasing number of complex antennas.

D. RECEIVER BLOCK DIAGRAM

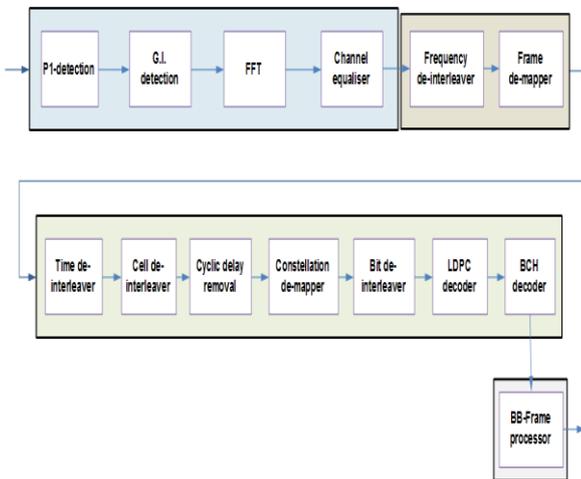

Fig. 5. DVB-T2 Demodulator

It is about the consumer receivers whose main function is to decode and produce an output which combines the Transport stream carried by one PLP and its common PLP interface. Certain parts belonging to the receiver corresponds directly to any of the blocks or features in the modulator and other part such as synchronization does not play any counterpart with the receiver [2].

IV. RESULTS AND ANALYSIS

MATLAB code has been written for each block and link all the blocks. Input Bit stream has generated given to

the BCH encoder .Bit stream length is 43040 for LDPC cord identifier 2/3. The DVB-T2 transmission system transmitter and receiver has been implemented with Multiple Input Single Output technique which already with the system. Because more time consumed for developing the DVB-T2 standard system the MIMO technology could not implemented in the MATLAB. But most part of the DVB-T2 system has been implemented and simulated using MATLAB.

From the implemented blocks, the input to the BCH encoder and output from the BCH decoder has been compared and bit error rate calculated for the SNR value of 1:15. Output from the QAM and Rotated QAM has been plotted. Finally Bit error probability graph plotted between SNR vs. BER.

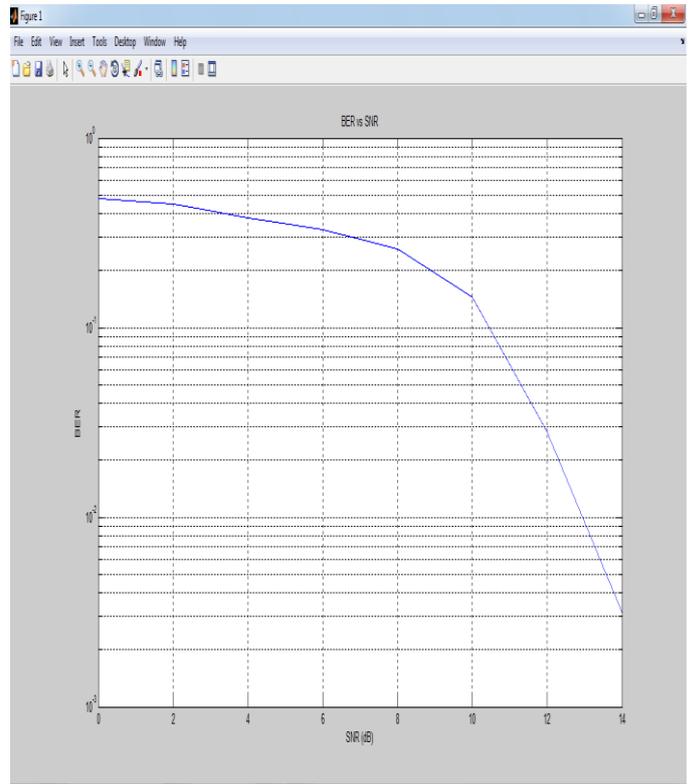

Figure 6. Plotted graph between SNR vs. BER

BER is the measure of error rate compare between transmitted and received bits. With the help of BER transmission accuracy can be measure easily. The above fig obtained is used to calculate how error free transmission has been achieved. The graph is exponentially decaying as the amount of noise level is decreased gradually. We can see that the E_b/N_0 value at about 14 dbhas very less BER.

V. CONCLUSIONS

Before starting the development process, lot of primary as well as secondary research has been made. During this research period I have learned a much about the DVB-T2 system and MIMO-OFDM technology. After making the necessary background required to do the development, I have explored the MATLAB and learned different coding techniques, logics and working principle of MATLAB. During the development of the DVB2 simulator, I learned how the wireless communication

simulation can be achieved using MATLAB before implementing in the real world. Since the OFDM is very flexible as it supports different modulation techniques. During this implementation the transmission of random binary stream using the 16-QAM the constellation received from the transmitter is accurate which proves that the transmission method is going on the right way. It is concluded that the MIMO technology will provide a better solution for a large number of users using HDTV. The obtained BER vs. SNR graph shows the accuracy of the system after the execution.

Pressure Sensor based Event Data Recorder

Dinesh¹, Sree Rajendra²

^{1,2}(Department of Mechanical Engineering, Malnad College of Engineering, Hassan, India)

Abstract : Airbag Control Module (ACM) is designed to detect the vehicle crash, measure the severity and to deploy airbags if necessary. ACM's another function is to record the crash related data from vehicles internal accelerometers and sensors from different modules. The system is also known as Event Data Recorder (EDR). This paper describes the operations of an EDR, which detects the crash based on pressure, applied on to the vehicle during a collision, sensed by a pressure sensor. This paper also describes the operations and characteristics of vehicle speed and ultrasonic sensor during the time of crash.

Keywords: Airbags, Airbag Control Module (ACM), Event Data Recorder (EDR), Pre-Crash Data, Vehicle Crash Analysis

I. INTRODUCTION

Most vehicles are equipped with airbags. The purpose of the airbag is to help protect the occupant in a collision. Airbags are only effective and therefore only deploy in collisions of certain severity and direction. In order for the airbag system to know when and how to deploy the airbag, it must know what is going on and predict what is going to happen. The system accomplishes this by measuring specific data, such as vehicle speed and acceleration, collision direction, occupant seatbelt use, and other criteria [1].

Event data recorders (EDR) have been installed in vehicles for over 30 years, with General Motors (GM) being at the forefront of the use of this technology by introducing it in select vehicle models starting in 1974. The EDR's in these vehicles were primarily used to control and record airbag deployments [2].

Airbag equipped vehicles use a crash sensing algorithm to decide when to deploy the airbags. It is a predictive algorithm, typically making deployment decisions within 15-50 Millie sec after impact [3].

EDR's have been used for many years to record the crash related metrics, including deceleration characteristics of the vehicle, be it airplane, train, ship, or highway vehicle. Aviation has long been the proving ground for on-board recording devices. Crash protected flight data recorders have been around since the early 1950's, while the cockpit voice recorders were introduced in late 1960's. Significant improvements in safety have been realized in aviation as a result of flight data and cockpit voice recorders [4].

GM introduced the first regular production driver/passenger airbag systems as an option in selected 1974 production vehicles. In 1990, a more complex Diagnostic and Energy Reserve Module (DERM) was introduced with the added capability to record closure times for both arming and discriminating sensors as well as any fault codes present at the time of deployment. In 1992, GM installed sophisticated crash-data recorders on 70 Indy race cars. While impractical for high volume production, these recorders provided new information on human body tolerance to impact that can help improve both passenger

vehicle occupant and race car driver safety. For the 1994 model year, the multiple electromechanical switches previously used for crash sensing were replaced by the combination of a single solid state analog accelerometer and a computer algorithm integrated in a Sensing & Diagnostic Module (SDM) [5].

Depending upon the year and model of vehicle, the SDM module may contain all or some of the following information [6]:

- Brake status and Throttle position up to 5 seconds before impact
- Vehicle forward speed and Engine speed up to 5 seconds before impact
- Air bag warning lamp, driver's seat belt buckle and right front passenger air bag suppression switch status
- Number of ignition cycles at the time of the incident and at the time of the investigation
- Other relevant times and longitudinal speed changes in relation to near deployment or deployment

Pre-crash sensing may well have the most impact in reducing injuries from night time accidents involving impaired drivers. However, the advanced safety features enabled by pre-crash sensing will provide a significant benefit in all cases of poor lighting, bad weather, or driver distraction [7].

Today's airbag and seatbelt systems will be more effective if advanced occupant sensors are added to pre-crash sensors, creating occupant protections with advanced restraints that adapt to whoever happens to be sitting in the vehicle and to the demands of a variety of crash scenarios [8].

II. PRINCIPLE OF OPERATION

In this section we discuss about the principle behind the operation of the proposed pressure sensor based pre-crash data recording system with respect to its flexibility, robustness, performance and complexity of the airbag deployment function.

During a crash, the system does not deploy the airbags unnecessarily. The system measures the severity of the crash against a set of pre-defined deployment criteria. The system deploys the airbags in real-time when the applied pressure crosses its threshold within the specified time. The Fig.1 shows the principle of operation behind the airbag deployment.

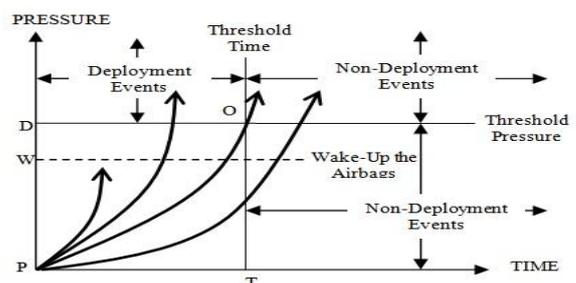

Fig.1. Airbag deployment operational characteristics

From the Fig.1, consider a vehicle moving at a constant speed collides with an obstacle at a point P. Due to the impact of collision, the pressure on the vehicle body increases quickly with time. The rising curves in the Fig.1 shows the rise in the pressure. The line originating from the point 'W' indicates the airbag wake up time and the line originating from the point 'D' represents the threshold pressure. The line originating from point 'T' represents the threshold time. The system measures the rising pressure to calculate the crash severity. The system measures the crash severity to decide the event as a deployment or as a non-deployment event.

When the pressure building on the vehicle reaches the threshold pressure within the threshold time, then the system considers the event as a severe crash and deployment criteria's are fulfilled. Then the system deploys the airbag. This is shown in the Fig.1 as when the pressure line crosses the threshold pressure line 'D' within the threshold time line 'T'. The point 'O' is an optimum point for the deployment. When the pressure on the vehicle does not reach the threshold pressure or when the pressure reach the threshold pressure after the threshold time, the system considers the event is of less severity and does not deploy the airbags.

When the pressure reaches the line originating from the point 'W', i.e., wake-up the airbags line, the system initializes the airbags. This is due to avoid the delay in opening of the airbags in a severe crash. In the Fig.1, the area above the line DO represents the deployment events.

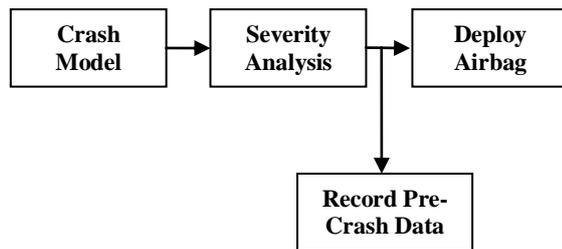

Fig.2. Functional Block Diagram

Fig.2 shows the functional block diagram of the system. Consider the Fig.2; the crash model consists of the required hardware and the software units. When the vehicle is collided with an obstacle, this unit detects the crash and crash sends the signals to the severity analysis unit continuously for which time the pressure on the vehicle body increases. The severity analysis unit measures these signals comparing with the predefined set of truth tables and algorithms to decide the event as a deployment event, near deployment event or as a non-deployment event. If the crash signals meet the deployment criteria, then the system deploys the airbags and simultaneously records the system status at the time of collision from different sensors of different modules and their trend at the time of crash for some time. If the crash criteria's does not meet the deployment criteria, then the system does not deploy the airbags and record the event as a near deployment event and records the pre-crash data.

III. MODEL DEVELOPMENT

3.1. Hardware Organization

The Fig.3 shows the hardware organization of the system. Different sensors and simulators are connected to the Central Processing Unit (CPU) or a microcontroller

using a suitable circuits, buses and protocols. The hardware details and their applications and utilization in the system are as follows.

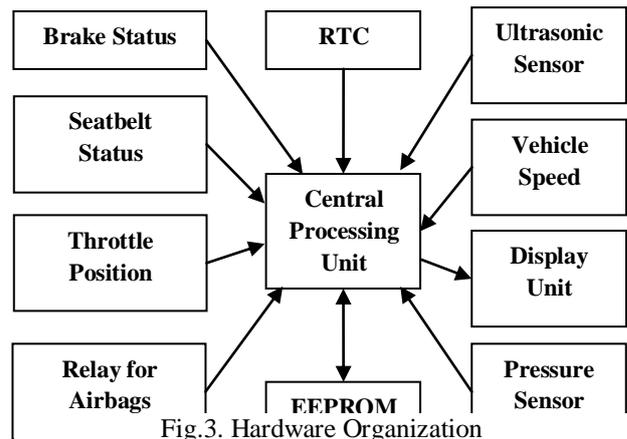

Fig.3. Hardware Organization

- **Pressure Sensor:** Pressure sensor is the main component in the system. When the vehicle collides with an obstacle it senses the increasing pressure on the vehicle body. It immediately generates an interrupt signal and sends it to the CPU. The CPU halts the current execution and waits for the further signals from the pressure sensor. The pressure sensor measures the impact and sends the signals to the CPU continuously. The CPU takes further action to measure the crash severity and to decide the event as a deployment event or as a non-deployment event.
- **Central Processing Unit (CPU):** The CPU or a microcontroller is the heart of the system. It controls and coordinates the entire system. The CPU executes the software instructions as required. The required software and the algorithms for the crash sensing and severity analysis are stored in the memory unit of the CPU. The CPU loads these instructions at the time of vehicle start or the system initialization and executes them. When the crash is detected by the pressure sensor, it receives the interrupt and halts the execution of the system and wait for further signals from pressure sensor. The CPU calculates the crash severity based on the pressure applied on the vehicle for a fixed period of time. If the pressure built reaches the threshold pressure within the threshold time, the system immediately deploys airbags. Simultaneously it writes the crash data from internal modules and sensors into the EEPROM. If the crash does not meet the deployment criteria's then the system does not deploy the airbags and writes the crash data into the EEPROM.
- **Vehicle Speed:** The vehicle speed is simulated using a rotary potentiometer. The vehicle speed is an important parameter in the crash analysis. The vehicle speed is measured to determine the speed of the vehicle at the time of crash and its trend before and after the crash.
- **Ultrasonic Sensor:** Ultrasonic sensor measures the distance between the obstacle in front of the vehicle. The distance between the vehicle and the obstacle has many applications in crash analysis. During driving, this sensor measures distance between the obstacle coming ahead to the vehicle and give information to the occupant.

- Relays for Airbags: Airbags are the balloon like structures, which are hidden in front and sides of the passenger seats. During a crash, if the crash parameters reach the deployment criteria, then they get ejected. The airbags should be ejected at correct time so that the occupant must be utilized optimally. Relay is a switch, which is activated by a CPU when the deployment criteria's reached, which turns ON the airbags.
- Display Unit: Display unit comprises of a Liquid Crystal Display (LCD) screen, which displays the actions that are going in the system continuously. It displays the speed of the vehicle, distance between the forward obstacle and the vehicle and other parameters such as temperature, engine speed. The CPU fetches the data from the vehicle modules and transfers the strings to LCD to display.
- Throttle Position: Throttle measures the amount of fuel flowing into the engine. The accelerator pedal controls the throttle. The throttle position is closely associated with the vehicle speed. The amount of throttle opened is equal to the amount of accelerator pedal is pressed. In the experimental environment, consider as a vehicle is moving on a smooth road at its topmost gear. The amount of vehicle speed simulating potentiometer rotated indicates the amount of throttle opened or the accelerator pedal pressed.
- Brake status: Brakes are used to stop the vehicle while moving. At the time of vehicle start, the system checks for the proper functioning of the brakes and displays the information. At the time of collision, the system records the braking variations for a fixed period of time.
- Seatbelt Status: Seatbelts are used to place the occupant on the seat during collision and helps the occupant to utilize the airbags so as to minimize the injuries. At the time of vehicle start, the system checks for the seatbelt status whether they are fastened or not. If they are not fastened, the system displays a warning string on the LCD.
- EEPROM: Electrically Erasable Programmable Read Only Memory (EEPROM) is a fast memory unit, which is used to store the pre-crash, crash and post-crash data. When the airbags are deployed, the CPU immediately writes the pre-crash data into EEPROM. The data include sensor and simulators status at the time of collision and their trends at the time of crash for a fixed period.
- RTC: Real Time Clock (RTC) is a clock that causes occurrences of regular interval interrupts on its each tick (timeout). In the system, RTC provides the current time. It gives the exact time of crash. It is associated with a battery, so it never stops.

3.2. Functional Modules Used

The software required to the system are divided into suitable modules and stored in the memory which can be accessible by the CPU. The functional modules and their functions are as follows.

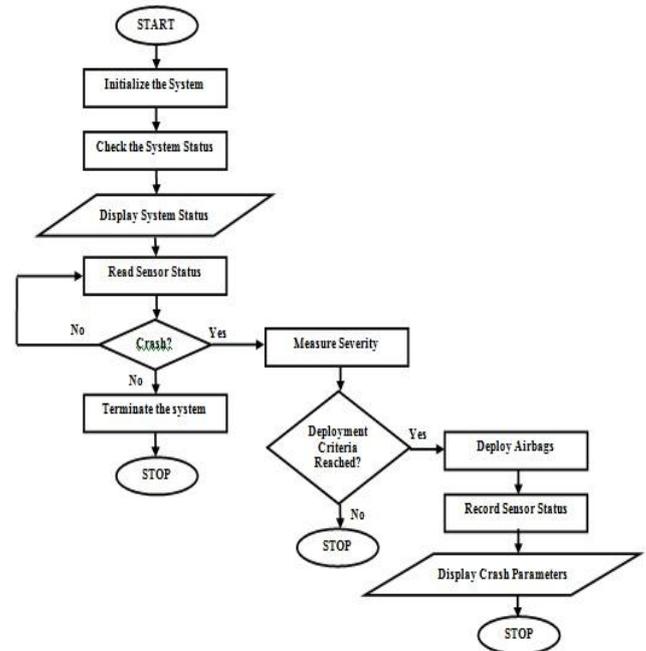

Fig. 4. Functional Flow Chart

- Analog-to-digital Conversion (ADC): This module manipulates the analog sensors such as potentiometers, ultrasonic sensors, pressure sensors and temperature sensors. This module assigns ADC channels of the CPU to different sensors and converts their analog values into digital values. These values are returned when they are called.
- Universal Asynchronous Receiver and Transmitter (UART): This module is used to retrieve the crash data using a Personnel Computer. This is also used to check the operations that are taking place in the system.
- Controller Area Network (CAN): This module is designed to test brakes and seatbelt at the start. This module also monitors and gives the result of how much braking is done at the time of crash. Before analyzing brakes and seatbelts, this module tests CAN for network malfunctions and breakages.
- Inter-Integrated-Circuit (I2C): This is a serial bus protocol used to connect different devices within the board. This used to write the crash data to the EEPROM.
- Interrupt: This module is activated whenever a crash is reported. When the crash happens, the pressure sensor sends an interrupt signal to the CPU which halts the current execution and calls the Interrupt Service Routine (ISR). The ISR actually measure the crash severity and returns its status to CPU to decide the event as a deployment event or as a non-deployment event.

Fig.4 shows the sequence of operations that take place in the proposed EDR.

3.3. Parameters being recorded

- Vehicle Speed: The speed of the vehicle at the time of crash and its trend for the period of 5 seconds before the crash.
- Distance between the obstacle and the vehicle: Using the ultrasonic sensor, distance between the obstacle and the vehicle is measured for a period of 5 seconds before the crash.
- Brake status: The amount of brake applied at the time of crash is measured for a period of 5 seconds.
- Seatbelt status: Seatbelt status, whether it is fastened or not at the time of crash.
- Throttle position: The amount of throttle opened at the time of crash and its trend before the crash for a period of 5 seconds.

IV. EXPERIMENTAL RESULTS

4.1. Vehicle Speed

The proposed system continuously read the speed of the vehicle since its initialization to its termination. The sample variation in the speed of the vehicle because of acceleration and deceleration in a sample period of one minute is shown in the Fig.5. Fig.6 illustrates the speed characteristics at the time of crash. The curve shows the decrease in speed due to the possible application of brakes or releasing the accelerator pedal at the moment of crash.

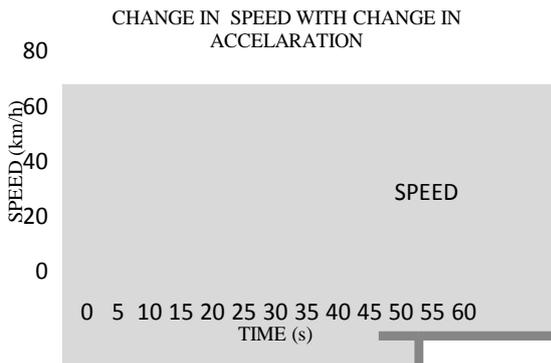

Fig.4. Speed variations during a normal drive

4.2. Throttle Position and Braking

The throttle position indicates amount of fuel flowing into the engine. This also shows the operators acceleration inputs and its trend while driving. In the experiment, consider a vehicle moving on a smooth road at its topmost gear. In normal driving the amount of braking can be ignored because braking will be at a moderate rate. The Fig.7 shows the sample variation of the percentage throttle during vehicle driving taken over a period of one minute.

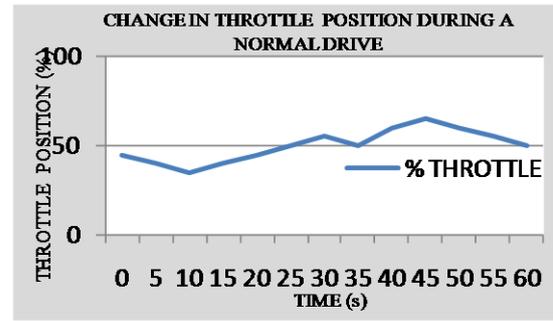

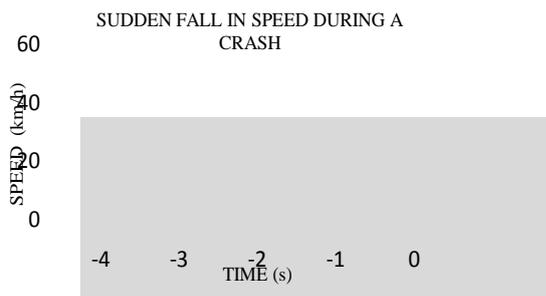

Fig.5. Sudden deceleration during a crash
Fig.7. Throttle position during a normal drive

During a crash event the operator's input to the accelerator pedal is most unpredictable. He can either press the pedal more or release his foot from the pedal and tries to put it on break. The characteristic of the throttle and braking during a crash is shown in Fig.8.

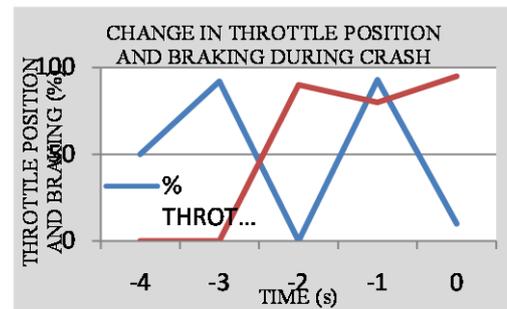

Fig.8. Change of throttle position and braking during a crash

4.3. Ultrasonic Sensor

Ultrasonic sensor measures distance between the vehicle and the obstacle in the line of the vehicle. The Fig.9 shows the sample variation of distance between the obstacle vehicle moving along the same line of the occupant vehicle which is incorporated with the proposed EDR, considering the vehicle moving at a constant speed. The simulation distance was taken in inches measured over a period of one minute.

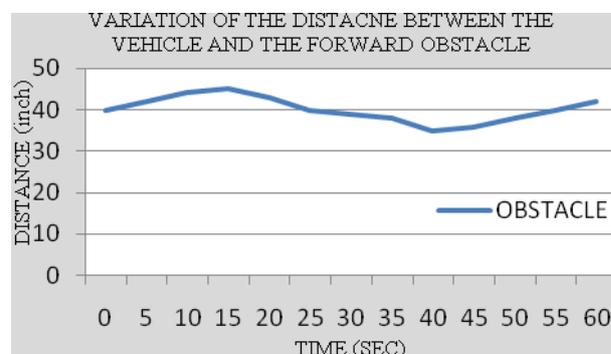

Fig.9. Variation of distance during a normal drive

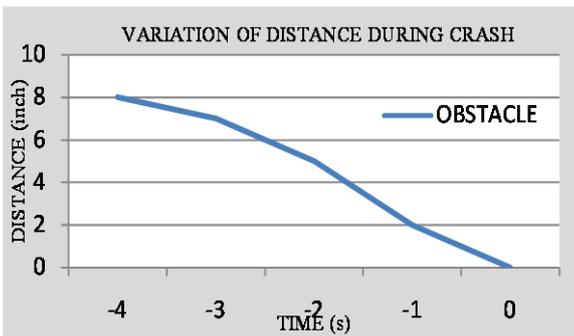

REFERENCES

Fig.10. Variation of distance during crash

The Fig.10 depicts the characteristic curve of the ultrasonic sensor during a crash event. During crash event the distance between the vehicle and the colliding object becomes zero in a short period of time. The graph shows, the time taken to reach a distance of 8 inch to 0 inch is 5 seconds in the prototype by simulation.

V. ADVANTAGES

5.1 Pressure Sensor

The system detects the crash based on the pressure rather than the sudden deceleration as in traditional methods. By detecting the collision by sensing pressure has advantage over the collision detection by quick deceleration. The system can detect the collision even when the occupant vehicle is at rest and hit by an obstacle. The system can detect the frontal crash; rear crash, side crash, and roll over crash more accurately than the traditional deceleration technique. The system deploys the airbags only in the events of severe crash and at correct time. This avoids unnecessary opening of airbags and unwanted losses.

5.2 Ultrasonic Sensor

Ultrasonic sensor measures the distance between the forward obstacle and the vehicle. This sensor predicts the crash based on the sudden decrease in the distance and helps in waking up the airbags. If the measured distance become very less than the threshold, it gives a warning message to the occupant about its crash prediction. The ultrasonic sensor can also be used in the application of Adaptive Cruise Control (ACC) for the better comfort driving.

VI. SUMMARY

This paper describes the operations and functions of the pre-crash data recording system or an Event Data recorder (EDR) which detects the crash based on the pressure applied on the vehicle body by a colliding obstacle. The system is accurate, robust and flexible. The system predicts the crash using the readings from the ultrasonic sensor. The system wakes up the airbags at the time of collision to avoid the unwanted delay in deployment. The system checks for the brake and seatbelt status at the time of the vehicle start and give warnings to the occupant if there any malfunctions. The recorded pre-crash data is accurate and this data can be used by the governing authorities to improve the safety in vehicles and also can be used in legal issues.

ABSTRACT: Von Neumann Entropy and computational complexity theory is a branch of the theory of computation in theoretical computer science and mathematics that focuses on classifying computational problems according to their inherent difficulty, and relating those classes to each other. In this context, a computational problem is understood to be a task that is in principle amenable to being solved by a computer (which basically means that the problem can be stated by a set of mathematical instructions). Informally, a computational problem consists of problem instances and solutions to these problem instances. For example, primality testing is the problem of determining whether a given number is prime or not. The instances of this problem are natural numbers, and the solution to an instance is yes or no based on whether the number is prime or not. A problem is regarded as inherently difficult if its solution requires significant resources, whatever the algorithm used. The theory formalizes this intuition, by introducing mathematical models of computation to study these problems and quantifying the amount of resources needed to solve them, such as time and storage. Other complexity measures are also used, such as the amount of communication (used in communication complexity), the number of gates in a circuit (used in circuit complexity) and the number of processors (used in parallel computing). One of the roles of computational complexity theory is to determine the practical limits on what computers can and cannot do. Closely related fields in theoretical computer science are analysis of algorithms and computability theory. A key distinction between analysis of algorithms and computational complexity theory is that the former is devoted to analyzing the amount of resources needed by a particular algorithm to solve a problem, whereas the latter asks a more general question about all possible algorithms that could be used to solve the same problem. More precisely, it tries to classify problems that can or cannot be solved with appropriately restricted resources. In turn, imposing restrictions on the available resources is what distinguishes computational complexity from computability theory: the latter theory asks what kind of problems can, in principle, be solved algorithmically. Low-energy excitations of one-dimensional spin-orbital models which consist of spin waves, orbital waves, and joint spin-orbital excitations. Among the latter we identify strongly entangled spin-orbital bound states which appear as peaks in the von Neumann entropy (vNE) spectral function introduced in this work. The strong entanglement of bound states is manifested by a universal logarithmic scaling of the vNE with system size, while the vNE of other spin-orbital excitations saturates. We suggest that spin-orbital entanglement can be experimentally explored by the measurement of the dynamical spin-orbital correlations using resonant inelastic x-ray scattering, where strong spin-orbit coupling associated with the core hole plays a role. Distinguish ability of States and von Neumann Entropy have been studied by Richard Jozsa, Juergen Schlienz. Consider an ensemble of pure quantum states $|\psi_j\rangle$, $j=1,\dots,n$ taken with prior probabilities p_j respectively. It has been shown that it is possible to increase all of the pair wise overlaps $|\langle\psi_i|\psi_j\rangle|$ i.e. make each constituent pair of the states more parallel (while keeping the prior probabilities the same), in such a way that the von Neumann entropy S is increased, and dually, make all pairs more orthogonal while decreasing S . This phenomenon cannot occur for ensembles in two dimensions but that it is a feature of almost all ensembles of three states in three dimensions. It is known that the von Neumann entropy characterizes the classical and quantum information capacities of the ensemble and we argue that information capacity in turn, is a manifestation of the distinguish ability of the signal states. Hence our result shows that the notion of distinguish ability within an ensemble is a global property that cannot be reduced to considering distinguish ability of each constituent pair of states.

Key words: Von Neumann entropy, Quantum computation, Governing equations

Introduction

Von Neumann entropy

In quantum statistical mechanics, von Neumann entropy, named after John von Neumann, is the extension of classical entropy concepts to the field of quantum mechanics. John von Neumann rigorously established the mathematical framework for quantum mechanics in his work *Mathematische Grundlagen der Quantenmechanik*. In it, he provided a theory of measurement, where the usual notion of wave-function collapse is described as an irreversible process (the so-called von Neumann or projective measurement).

The density matrix was introduced, with different motivations, by von Neumann and by Lev Landau. The motivation that inspired Landau was the impossibility of describing a subsystem of a composite quantum system by a state vector. On the

other hand, von Neumann introduced the density matrix in order to develop both quantum statistical mechanics and a theory of quantum measurements. The density matrix formalism was developed to extend the tools of classical statistical mechanics to the quantum domain. In the classical framework, we compute the partition function of the system in order to evaluate all possible thermodynamic quantities. Von Neumann introduced the density matrix in the context of states and operators in a Hilbert space. The knowledge of the statistical density matrix operator would allow us to compute all average quantities in a conceptually similar, but mathematically different way. Let us suppose we have a set of wave functions $|\Psi\rangle$ which depend parametrically on a set of quantum numbers n_1, n_2, \dots, n_N . The natural variable which we have is the amplitude with which a particular wavefunction of the basic set participates in the actual wavefunction of the system. Let us denote the square of this amplitude by $p(n_1, n_2, \dots, n_N)$. The goal is to turn this quantity p into the classical density function in phase space. We have to verify that p goes over into the density function in the classical limit, and that it has ergodic properties. After checking that $p(n_1, n_2, \dots, n_N)$ is a constant of motion, an ergodic assumption for the probabilities $p(n_1, n_2, \dots, n_N)$ makes p a function of the energy only.

After this procedure, one finally arrives at the density matrix formalism when seeking a form where $p(n_1, n_2, \dots, n_N)$ is invariant with respect to the representation used. In the form it is written, it will only yield the correct expectation values for quantities which are diagonal with respect to the quantum numbers n_1, n_2, \dots, n_N . Expectation values of operators which are not diagonal involve the phases of the quantum amplitudes. Suppose we encode the quantum numbers n_1, n_2, \dots, n_N into the single index i or j . Then our wave function has the form

$$|\Psi\rangle = \sum_i a_i |\psi_i\rangle.$$

The expectation value of an operator B which is not diagonal in these wave functions, so

$$\langle B \rangle = \sum_{i,j} a_i^* a_j \langle i|B|j\rangle.$$

The role, which was originally reserved for the quantities, $|a_i|^2$ is thus taken over by the density matrix of the system S .

$$\langle j|\rho|i\rangle = a_j a_i^*.$$

Therefore $\langle B \rangle$ reads as $\langle B \rangle = \text{Tr}(\rho B)$.

The invariance of the above term is described by matrix theory. A mathematical framework was described where the expectation value of quantum operators, as described by matrices, is obtained by taking the trace of the product of the density operator $\hat{\rho}$ and an operator \hat{B} (Hilbert scalar product between operators). The matrix formalism here is in the statistical mechanics framework, although it applies as well for finite quantum systems, which is usually the case, where the state of the system cannot be described by a pure state, but as a statistical operator $\hat{\rho}$ of the above form. Mathematically, $\hat{\rho}$ is a positive, semi definite Hermitian matrix with unit trace

Given the density matrix ρ , von Neumann defined the entropy as $S(\rho) = -\text{Tr}(\rho \ln \rho)$,

Which is a proper extension of the Gibbs entropy (up to a factor k_B) and the Shannon entropy to the quantum case. To compute $S(\rho)$ it is convenient (see logarithm of a matrix) to compute the Eigen decomposition of $\rho = \sum_j n_j |j\rangle \langle j|$. The von Neumann entropy is then given by

$$S(\rho) = -\sum_j n_j \ln n_j.$$

Since, for a pure state, the density matrix is idempotent, $\rho^2 = \rho$, the entropy $S(\rho)$ for it vanishes. Thus, if the system is finite (finite dimensional matrix representation), the entropy (ρ) quantifies the departure of the system from a pure state. In other words, it codifies the degree of mixing of the state describing a given finite system. Measurement decohere a quantum system into something noninterfering and ostensibly classical; so, e.g., the vanishing entropy of a pure state $|\Psi\rangle = (|0\rangle + |1\rangle)/\sqrt{2}$, corresponding to a density matrix

$$\rho = \frac{1}{2} \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \text{ increases to } S = \ln 2 = 0.69 \text{ for the measurement outcome mixture}$$

$$\rho = \frac{1}{2} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \text{ As the quantum interference information is erased.}$$

Properties

Some properties of the von Neumann entropy:

$S(\rho)$ is only zero for pure states.

$S(\rho)$ is maximal and equal to $\ln N$ for a maximally mixed state, N being the dimension of the Hilbert space.

$S(\rho)$ is invariant under changes in the basis of ρ , that is, $S(\rho) = S(U\rho U^\dagger)$, with U a unitary transformation.

$S(\rho)$ is concave, that is, given a collection of positive numbers λ_i which sum to unity ($\sum_i \lambda_i = 1$) and density operators ρ_i , we have

$$S\left(\sum_{i=1}^k \lambda_i \rho_i\right) \geq \sum_{i=1}^k \lambda_i S(\rho_i).$$

$S(\rho)$ is additive for independent systems. Given two density matrices ρ_A, ρ_B describing independent systems A and B, we have $S(\rho_A \otimes \rho_B) = S(\rho_A) + S(\rho_B)$.

$S(\rho)$ strongly sub additive for any three systems A, B, and C:
 $S(\rho_{ABC}) + S(\rho_B) \leq S(\rho_{AB}) + S(\rho_{BC})$.

This automatically means that $S(\rho)$ is sub additive:

$$S(\rho_{AC}) + S(\rho_B) \leq S(\rho_A) + S(\rho_C).$$

Below, the concept of subadditivity is discussed, followed by its generalization to strong Subadditivity.

Subadditivity

If ρ_A, ρ_B are the reduced density matrices of the general state ρ_{AB} , then

$$|S(\rho_A) - S(\rho_B)| \leq S(\rho_{AB}) \leq S(\rho_A) + S(\rho_B).$$

This right hand inequality is known as subadditivity. The two inequalities together are sometimes known as the triangle inequality. They were proved in 1970 by Huzihiro Araki and Elliott H. Lieb While in Shannon's theory the entropy of a composite system can never be lower than the entropy of any of its parts, in quantum theory this is not the case, i.e., it is possible that $S(\rho_{AB}) = 0$ while $S(\rho_A) > 0$ and $S(\rho_B) > 0$.

Intuitively, this can be understood as follows: In quantum mechanics, the entropy of the joint system can be less than the sum of the entropy of its components because the components may be entangled. For instance, the Bell state of two spin-1/2's, $|\psi\rangle = |\uparrow\downarrow\rangle + |\downarrow\uparrow\rangle$, is a pure state with zero entropy, but each spin has maximum entropy when considered individually. The entropy in one spin can be "cancelled" by being correlated with the entropy of the other. The left-hand inequality can be roughly interpreted as saying that entropy can only be canceled by an equal amount of entropy.

If system A and system B have different amounts of entropy, the lesser can only partially cancel the greater, and some entropy must be left over. Likewise, the right-hand inequality can be interpreted as saying that the entropy of a composite system is maximized when its components are uncorrelated, in which case the total entropy is just a sum of the sub-entropies. This may be more intuitive in the phase space, instead of Hilbert space, representation, where the Von Neumann entropy amounts to minus the expected value of the *-logarithm of the Wigner function up to an offset shift.

Strong Subadditivity

The von Neumann entropy is also strongly sub additive. Given three Hilbert spaces, A, B, C,

$$S(\rho_{ABC}) + S(\rho_B) \leq S(\rho_{AB}) + S(\rho_{BC}).$$

This is a more difficult theorem and was proved in 1973 by Elliott H. Lieb and Mary Beth Ruskai using a matrix inequality of Elliott H. Lieb proved in 1973. By using the proof technique that establishes the left side of the triangle inequality above, one can show that the strong subadditivity inequality is equivalent to the following inequality.

$$S(\rho_A) + S(\rho_C) \leq S(\rho_{AB}) + S(\rho_{BC})$$

When ρ_{AB} , etc. are the reduced density matrices of a density matrix ρ_{ABC} . If we apply ordinary subadditivity to the left side of this inequality, and consider all permutations of A, B, C, we obtain the triangle inequality for ρ_{ABC} : Each of the three numbers $S(\rho_{AB}), S(\rho_{BC}), S(\rho_{AC})$ is less than or equal to the sum of the other two.

Uses

The von Neumann entropy is being extensively used in different forms (conditional entropies, relative entropies, etc.) in the framework of quantum information theory. Entanglement measures are based upon some quantity directly related to the von Neumann entropy. However, there have appeared in the literature several papers dealing with the possible inadequacy of the Shannon information measure, and consequently of the von Neumann entropy as an appropriate quantum generalization of Shannon entropy. The main argument is that in classical measurement the Shannon information measure is a natural measure of our ignorance about the properties of a system, whose existence is independent of measurement.

Conversely, quantum measurement cannot be claimed to reveal the properties of a system that existed before the measurement was made. This controversy has encouraged some authors to introduce the non-additivity property of Tsallis entropy (a generalization of the standard Boltzmann–Gibbs entropy) as the main reason for recovering a true quantal information measure in the quantum context, claiming that non-local correlations ought to be described because of the particularity of Tsallis entropy.

Where we suppose-

- (A) $(a_i)^{(1)}, (a_i'')^{(1)}, (a_i''')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (b_i'')^{(1)} > 0$,
 $i, j = 13, 14, 15$
 (B) The functions $(a_i'')^{(1)}, (b_i'')^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a_i'')^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}.$$

- (C) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)}$
 $\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $\boxed{(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}}$ are positive constants and $\boxed{i = 13, 14, 15}$ -

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T'_{14}, t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T'_{14} - T_{14}| e^{-(\hat{M}_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, t)| < (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(\hat{M}_{13})^{(1)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions

$(a_i'')^{(1)}(T'_{14}, t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the first augmentation coefficient would be absolutely continuous. -

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

- (D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1 -$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

- (E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1 -$$

Where we suppose-

$$(a_i)^{(2)}, (a_i')^{(2)}, (a_i'')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (b_i'')^{(2)} > 0, \quad i, j = 16, 17, 18 -$$

The functions $(a_i'')^{(2)}, (b_i'')^{(2)}$ are positive continuous increasing and bounded. -

Definition of $(p_i)^{(2)}, (r_i)^{(2)}$:-

$$(a_i'')^{(2)}(T_{17}, t) \leq (p_i)^{(2)} \leq (\hat{A}_{16})^{(2)} -$$

$$(b_i'')^{(2)}(G_{19}, t) \leq (r_i)^{(2)} \leq (b_i')^{(2)} \leq (\hat{B}_{16})^{(2)} -$$

$$\lim_{T_2 \rightarrow \infty} (a_i'')^{(2)}(T_{17}, t) = (p_i)^{(2)} -$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(2)}(G_{19}, t) = (r_i)^{(2)} -$$

Definition of $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}$:

Where $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}$ are positive constants and $i = 16, 17, 18$ -

They satisfy Lipschitz condition:-

$$|(a_i'')^{(2)}(T_{17}, t) - (a_i'')^{(2)}(T_{17}, t)| \leq (\hat{k}_{16})^{(2)} |T_{17} - T_{17}'| e^{-(M_{16})^{(2)}t} -$$

$$|(b_i'')^{(2)}(G_{19}, t) - (b_i'')^{(2)}(G_{19}, t)| < (\hat{k}_{16})^{(2)} |(G_{19}) - (G_{19})'| e^{-(M_{16})^{(2)}t} -$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(2)}(T_{17}, t)$ and $(a_i'')^{(2)}(T_{17}, t) \cdot (T_{17}', t)$ and (T_{17}, t) are points belonging to the interval $[(\hat{k}_{16})^{(2)}, (\hat{M}_{16})^{(2)}]$. It is to be noted that $(a_i'')^{(2)}(T_{17}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{16})^{(2)} = 1$ then the function $(a_i'')^{(2)}(T_{17}, t)$, the SECOND augmentation coefficient would be absolutely continuous. -

Definition of $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$:-

(F) $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$, are positive constants

$$\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1 -$$

Definition of $(\hat{P}_{16})^{(2)}, (\hat{Q}_{16})^{(2)}$:

There exists two constants $(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ which together with $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}, (\hat{A}_{16})^{(2)}$ and $(\hat{B}_{16})^{(2)}$ and the constants $(a_i)^{(2)}, (a_i')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}, i = 16, 17, 18$, satisfy the inequalities -

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(a_i)^{(2)} + (a_i')^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 -$$

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(b_i)^{(2)} + (b_i')^{(2)} + (\hat{B}_{16})^{(2)} + (\hat{Q}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 -$$

Where we suppose-

(G) $(a_i)^{(3)}, (a_i')^{(3)}, (a_i'')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (b_i'')^{(3)} > 0, i, j = 20, 21, 22$

The functions $(a_i'')^{(3)}, (b_i'')^{(3)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(3)}, (r_i)^{(3)}$:

$$(a_i'')^{(3)}(T_{21}, t) \leq (p_i)^{(3)} \leq (\hat{A}_{20})^{(3)}$$

$$(b_i'')^{(3)}(G_{23}, t) \leq (r_i)^{(3)} \leq (b_i')^{(3)} \leq (\hat{B}_{20})^{(3)} -$$

$$\lim_{T_2 \rightarrow \infty} (a_i'')^{(3)}(T_{21}, t) = (p_i)^{(3)}$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(3)}(G_{23}, t) = (r_i)^{(3)}$$

Definition of $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}$:

Where $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}$ are positive constants and $i = 20, 21, 22$ -

They satisfy Lipschitz condition:

$$|(a_i'')^{(3)}(T_{21}, t) - (a_i'')^{(3)}(T_{21}, t)| \leq (\hat{k}_{20})^{(3)} |T_{21} - T_{21}'| e^{-(M_{20})^{(3)}t} -$$

$$|(b_i'')^{(3)}(G_{23}, t) - (b_i'')^{(3)}(G_{23}, t)| < (\hat{k}_{20})^{(3)} |(G_{23}) - (G_{23})'| e^{-(M_{20})^{(3)}t} -$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(3)}(T_{21}, t)$ and $(a_i'')^{(3)}(T_{21}, t) \cdot (T_{21}', t)$ and (T_{21}, t) are points belonging to the interval $[(\hat{k}_{20})^{(3)}, (\hat{M}_{20})^{(3)}]$. It is to be noted that $(a_i'')^{(3)}(T_{21}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{20})^{(3)} = 1$ then the function $(a_i'')^{(3)}(T_{21}, t)$, the THIRD first augmentation coefficient would be absolutely continuous. -

Definition of $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$:

(H) $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$, are positive constants

$$\frac{(a_i)^{(3)}}{(\hat{M}_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(\hat{M}_{20})^{(3)}} < 1 -$$

There exists two constants There exists two constants $(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ which together with $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}, (\hat{A}_{20})^{(3)}$ and $(\hat{B}_{20})^{(3)}$ and the constants $(a_i)^{(3)}, (a_i')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}, i = 20, 21, 22$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(a_i)^{(3)} + (a_i')^{(3)} + (\hat{A}_{20})^{(3)} + (\hat{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1 -$$

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b_i')^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1 -$$

Where we suppose-

- (I) $(a_i)^{(4)}, (a_i')^{(4)}, (a_i'')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (b_i'')^{(4)} > 0, \quad i, j = 24, 25, 26$
 (J) The functions $(a_i'')^{(4)}, (b_i'')^{(4)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(4)}, (r_i)^{(4)}$:

$$(a_i'')^{(4)}(T_{25}, t) \leq (p_i)^{(4)} \leq (\hat{A}_{24})^{(4)}$$

$$(b_i'')^{(4)}((G_{27}), t) \leq (r_i)^{(4)} \leq (b_i')^{(4)} \leq (\hat{B}_{24})^{(4)}.$$

(K) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(4)}(T_{25}, t) = (p_i)^{(4)}$

$\lim_{G \rightarrow \infty} (b_i'')^{(4)}((G_{27}), t) = (r_i)^{(4)}$

Definition of $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}$:

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$.

They satisfy Lipschitz condition:

$$|(a_i'')^{(4)}(T'_{25}, t) - (a_i'')^{(4)}(T_{25}, t)| \leq (\hat{k}_{24})^{(4)} |T'_{25} - T_{25}| e^{-(\hat{M}_{24})^{(4)}t}$$

$$|(b_i'')^{(4)}((G_{27})', t) - (b_i'')^{(4)}((G_{27}), t)| < (\hat{k}_{24})^{(4)} |(G_{27})' - (G_{27})| e^{-(\hat{M}_{24})^{(4)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(4)}(T'_{25}, t)$ and $(a_i'')^{(4)}(T_{25}, t) \cdot (T'_{25}, t)$ and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that $(a_i'')^{(4)}(T_{25}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function $(a_i'')^{(4)}(T_{25}, t)$, the **FOURTH augmentation coefficient** would be absolutely continuous. -

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

(L) $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}} + \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1 -$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

(M) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}, (\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}, (a_i')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}, i = 24, 25, 26$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a_i')^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b_i')^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1 -$$

Where we suppose-

- (N) $(a_i)^{(5)}, (a_i')^{(5)}, (a_i'')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (b_i'')^{(5)} > 0, \quad i, j = 28, 29, 30$
 (O) The functions $(a_i'')^{(5)}, (b_i'')^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}, (r_i)^{(5)}$:

$$(a_i'')^{(5)}(T_{29}, t) \leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)}$$

$$\begin{aligned} G_i(0) &= G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{32})^{(6)}, T_i^0 \leq (\hat{Q}_{32})^{(6)}, - \\ 0 &\leq G_i(t) - G_i^0 \leq (\hat{P}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t} - \\ 0 &\leq T_i(t) - T_i^0 \leq (\hat{Q}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t} - \end{aligned}$$

By

$$\begin{aligned} \bar{G}_{32}(t) &= G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} G_{33}(s_{(32)}) - \left((a'_{32})^{(6)} + (a''_{32})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{32}(s_{(32)}) \right] ds_{(32)} - \\ \bar{G}_{33}(t) &= G_{33}^0 + \int_0^t \left[(a_{33})^{(6)} G_{32}(s_{(32)}) - \left((a'_{33})^{(6)} + (a''_{33})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{33}(s_{(32)}) \right] ds_{(32)} - \\ \bar{G}_{34}(t) &= G_{34}^0 + \int_0^t \left[(a_{34})^{(6)} G_{33}(s_{(32)}) - \left((a'_{34})^{(6)} + (a''_{34})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{34}(s_{(32)}) \right] ds_{(32)} - \\ \bar{T}_{32}(t) &= T_{32}^0 + \int_0^t \left[(b_{32})^{(6)} T_{33}(s_{(32)}) - \left((b'_{32})^{(6)} - (b''_{32})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{32}(s_{(32)}) \right] ds_{(32)} - \\ \bar{T}_{33}(t) &= T_{33}^0 + \int_0^t \left[(b_{33})^{(6)} T_{32}(s_{(32)}) - \left((b'_{33})^{(6)} - (b''_{33})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{33}(s_{(32)}) \right] ds_{(32)} - \\ \bar{T}_{34}(t) &= T_{34}^0 + \int_0^t \left[(b_{34})^{(6)} T_{33}(s_{(32)}) - \left((b'_{34})^{(6)} - (b''_{34})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{34}(s_{(32)}) \right] ds_{(32)} \end{aligned}$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$ -

(a) The operator $\mathcal{A}^{(1)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$\begin{aligned} G_{13}(t) &\leq G_{13}^0 + \int_0^t \left[(a_{13})^{(1)} \left(G_{14}^0 + (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}s_{(13)}} \right) \right] ds_{(13)} = \\ &= \left(1 + (a_{13})^{(1)}t \right) G_{14}^0 + \frac{(a_{13})^{(1)}(\hat{P}_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left(e^{(\hat{M}_{13})^{(1)}t} - 1 \right) - \end{aligned}$$

From which it follows that

$$(G_{13}(t) - G_{13}^0) e^{-(\hat{M}_{13})^{(1)}t} \leq \frac{(a_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{P}_{13})^{(1)} + G_{14}^0 \right) e^{-\frac{(\hat{P}_{13})^{(1)} + G_{14}^0}{G_{14}^0}} + (\hat{P}_{13})^{(1)} \right]$$

(G_i^0) is as defined in the statement of theorem 1-

Analogous inequalities hold also for $G_{14}, G_{15}, T_{13}, T_{14}, T_{15}$ -

The operator $\mathcal{A}^{(2)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that-

$$G_{16}(t) \leq G_{16}^0 + \int_0^t \left[(a_{16})^{(2)} \left(G_{17}^0 + (\hat{P}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}s_{(16)}} \right) \right] ds_{(16)} = \left(1 + (a_{16})^{(2)}t \right) G_{17}^0 + \frac{(a_{16})^{(2)}(\hat{P}_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left(e^{(\hat{M}_{16})^{(2)}t} - 1 \right)$$

From which it follows that

$$(G_{16}(t) - G_{16}^0) e^{-(\hat{M}_{16})^{(2)}t} \leq \frac{(a_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left[\left((\hat{P}_{16})^{(2)} + G_{17}^0 \right) e^{-\frac{(\hat{P}_{16})^{(2)} + G_{17}^0}{G_{17}^0}} + (\hat{P}_{16})^{(2)} \right] -$$

Analogous inequalities hold also for $G_{17}, G_{18}, T_{16}, T_{17}, T_{18}$ -

(a) The operator $\mathcal{A}^{(3)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{20}(t) \leq G_{20}^0 + \int_0^t \left[(a_{20})^{(3)} \left(G_{21}^0 + (\hat{P}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)}s_{(20)}} \right) \right] ds_{(20)} =$$

$$(1 + (a_{20})^{(3)}t)G_{21}^0 + \frac{(a_{20})^{(3)}(P_{20})^{(3)}}{(\bar{M}_{20})^{(3)}}(e^{(\bar{M}_{20})^{(3)}t} - 1) -$$

From which it follows that

$$(G_{20}(t) - G_{20}^0)e^{-(\bar{M}_{20})^{(3)}t} \leq \frac{(a_{20})^{(3)}}{(\bar{M}_{20})^{(3)}} \left[((\hat{P}_{20})^{(3)} + G_{21}^0)e^{-\frac{((\hat{P}_{20})^{(3)} + G_{21}^0)}{G_{21}^0}} + (\hat{P}_{20})^{(3)} \right] -$$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$ -

(b) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{24}(t) \leq G_{24}^0 + \int_0^t [(a_{24})^{(4)} (G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(\bar{M}_{24})^{(4)}s(24)})] ds_{(24)} =$$

$$(1 + (a_{24})^{(4)}t)G_{25}^0 + \frac{(a_{24})^{(4)}(P_{24})^{(4)}}{(\bar{M}_{24})^{(4)}}(e^{(\bar{M}_{24})^{(4)}t} - 1) -$$

From which it follows that

$$(G_{24}(t) - G_{24}^0)e^{-(\bar{M}_{24})^{(4)}t} \leq \frac{(a_{24})^{(4)}}{(\bar{M}_{24})^{(4)}} \left[((\hat{P}_{24})^{(4)} + G_{25}^0)e^{-\frac{((\hat{P}_{24})^{(4)} + G_{25}^0)}{G_{25}^0}} + (\hat{P}_{24})^{(4)} \right]$$

(G_i^0) is as defined in the statement of theorem -

(c) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{28}(t) \leq G_{28}^0 + \int_0^t [(a_{28})^{(5)} (G_{29}^0 + (\hat{P}_{28})^{(5)} e^{(\bar{M}_{28})^{(5)}s(28)})] ds_{(28)} =$$

$$(1 + (a_{28})^{(5)}t)G_{29}^0 + \frac{(a_{28})^{(5)}(P_{28})^{(5)}}{(\bar{M}_{28})^{(5)}}(e^{(\bar{M}_{28})^{(5)}t} - 1) -$$

From which it follows that

$$(G_{28}(t) - G_{28}^0)e^{-(\bar{M}_{28})^{(5)}t} \leq \frac{(a_{28})^{(5)}}{(\bar{M}_{28})^{(5)}} \left[((\hat{P}_{28})^{(5)} + G_{29}^0)e^{-\frac{((\hat{P}_{28})^{(5)} + G_{29}^0)}{G_{29}^0}} + (\hat{P}_{28})^{(5)} \right]$$

(G_i^0) is as defined in the statement of theorem -

(d) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that

$$G_{32}(t) \leq G_{32}^0 + \int_0^t [(a_{32})^{(6)} (G_{33}^0 + (\hat{P}_{32})^{(6)} e^{(\bar{M}_{32})^{(6)}s(32)})] ds_{(32)} =$$

$$(1 + (a_{32})^{(6)}t)G_{33}^0 + \frac{(a_{32})^{(6)}(P_{32})^{(6)}}{(\bar{M}_{32})^{(6)}}(e^{(\bar{M}_{32})^{(6)}t} - 1) -$$

From which it follows that

$$(G_{32}(t) - G_{32}^0)e^{-(\bar{M}_{32})^{(6)}t} \leq \frac{(a_{32})^{(6)}}{(\bar{M}_{32})^{(6)}} \left[((\hat{P}_{32})^{(6)} + G_{33}^0)e^{-\frac{((\hat{P}_{32})^{(6)} + G_{33}^0)}{G_{33}^0}} + (\hat{P}_{32})^{(6)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$ -

It is now sufficient to take $\frac{(a_i)^{(1)}}{(\bar{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\bar{M}_{13})^{(1)}} < 1$ and to choose

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have-

$$\frac{(a_i)^{(1)}}{(\bar{M}_{13})^{(1)}} \left[((\hat{P}_{13})^{(1)} + ((\hat{P}_{13})^{(1)} + G_j^0)e^{-\frac{((\hat{P}_{13})^{(1)} + G_j^0)}{G_j^0}}) \right] \leq (\hat{P}_{13})^{(1)} -$$

$$\frac{(b_i)^{(1)}}{(\bar{M}_{13})^{(1)}} \left[((\hat{Q}_{13})^{(1)} + T_j^0)e^{-\frac{((\hat{Q}_{13})^{(1)} + T_j^0)}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)} -$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric

$$d((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{13})^{(1)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{13})^{(1)}t} \} -$$

Indeed if we denote

$$\text{Definition of } \tilde{G}, \tilde{T} : (\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_{13}^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s(13)} e^{(\bar{M}_{13})^{(1)}s(13)} ds_{(13)} +$$

$$\int_0^t \{ (a'_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s(13)} e^{-(\bar{M}_{13})^{(1)}s(13)} +$$

$$(a''_{13})^{(1)} (T_{14}^{(1)}, s(13)) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s(13)} e^{(\bar{M}_{13})^{(1)}s(13)} +$$

$$G_{13}^{(2)} |(a_{13}^{(1)})^{(1)}(T_{14}^{(1)}, s_{(13)}) - (a_{13}^{(2)})^{(1)}(T_{14}^{(2)}, s_{(13)})| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{13})^{(1)}t} \leq \frac{1}{(\bar{M}_{13})^{(1)}} ((a_{13})^{(1)} + (a'_{13})^{(1)} + (\bar{A}_{13})^{(1)} + (\bar{P}_{13})^{(1)}(\bar{k}_{13})^{(1)}) d((G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)}))$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-

Remark 1: The fact that we supposed $(a_{13}^{(1)})^{(1)}$ and $(b_{13}^{(1)})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ and $(\bar{Q}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i^{(1)})^{(1)}$ and $(b_i^{(1)})^{(1)}$, $i = 13, 14, 15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i^{(1)})^{(1)} - (a_i^{(2)})^{(1)}\}(T_{14}(s_{(13)}), s_{(13)}) ds_{(13)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i^{(1)})^{(1)}t} > 0 \text{ for } t > 0$$

Definition of $((\bar{M}_{13})^{(1)})_1, ((\bar{M}_{13})^{(1)})_2$ and $((\bar{M}_{13})^{(1)})_3$:

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$$G_{13} < (\bar{M}_{13})^{(1)} \text{ it follows } \frac{dG_{14}}{dt} \leq ((\bar{M}_{13})^{(1)})_1 - (a'_{14})^{(1)}G_{14} \text{ and by integrating}$$

$$G_{14} \leq ((\bar{M}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)}((\bar{M}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\bar{M}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)}((\bar{M}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below.

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i^{(1)})^{(1)}(G(t), t)) = (b'_{14})^{(1)}$ then $T_{14} \rightarrow \infty$.

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i^{(1)})^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right), t = \log \frac{2}{\varepsilon_1} \text{ By taking now } \varepsilon_1 \text{ sufficiently small one sees that } T_{14} \text{ is unbounded. The same property}$$

holds for T_{15} if $\lim_{t \rightarrow \infty} ((b_{15}^{(1)})^{(1)}(G(t), t)) = (b'_{15})^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions -

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} < 1$ and to choose

$(\bar{P}_{16})^{(2)}$ and $(\bar{Q}_{16})^{(2)}$ large to have-

$$\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[(\bar{P}_{16})^{(2)} + ((\bar{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\bar{P}_{16})^{(2)} + G_j^0}{G_j^0} \right)} \right] \leq (\bar{P}_{16})^{(2)}$$

$$\frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\bar{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\bar{Q}_{16})^{(2)} + T_j^0}{T_j^0} \right)} + (\bar{Q}_{16})^{(2)} \right] \leq (\bar{Q}_{16})^{(2)}$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric

$$d(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t} \}$$

Indeed if we denote

Definition of $\widetilde{G}_{19}, \widetilde{T}_{19}$: $(\widetilde{G}_{19}, \widetilde{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19})$

It results

$$|\widetilde{G}_{16}^{(1)} - \widetilde{G}_{16}^{(2)}| \leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} ds_{(16)} + \int_0^t \{(a'_{16})^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{-(\bar{M}_{16})^{(2)}s_{(16)}} +$$

$$(a''_{16})^{(2)}(T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} + G_{16}^{(2)} |(a''_{16})^{(2)}(T_{17}^{(1)}, s_{(16)}) - (a''_{16})^{(2)}(T_{17}^{(2)}, s_{(16)})| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} ds_{(16)} -$$

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$|(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\bar{M}_{16})^{(2)}t} \leq \frac{1}{(\bar{M}_{16})^{(2)}} ((a_{16})^{(2)} + (a'_{16})^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)}(\hat{k}_{16})^{(2)}) d((G_{19})^{(1)}, (T_{19})^{(1)}; (G_{19})^{(2)}, (T_{19})^{(2)}) -$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-

Remark 1: The fact that we supposed $(a''_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{16})^{(2)}e^{(\bar{M}_{16})^{(2)}t}$ and $(\hat{Q}_{16})^{(2)}e^{(\bar{M}_{16})^{(2)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(2)}$ and $(b''_i)^{(2)}$, $i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From CONCATENATED SYTEM OF GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(2)} - (a''_i)^{(2)}(T_{17}(s_{(16)}), s_{(16)})\} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(2)}t} > 0 \text{ for } t > 0 -$$

Definition of $(\bar{M}_{16})^{(2)}_1, (\bar{M}_{16})^{(2)}_2$ and $(\bar{M}_{16})^{(2)}_3$:

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if

$$G_{16} < (\bar{M}_{16})^{(2)} \text{ it follows } \frac{dG_{17}}{dt} \leq ((\bar{M}_{16})^{(2)})_1 - (a'_{17})^{(2)}G_{17} \text{ and by integrating}$$

$$G_{17} \leq ((\bar{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)}((\bar{M}_{16})^{(2)})_1 / (a'_{17})^{(2)}$$

In the same way, one can obtain

$$G_{18} \leq ((\bar{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)}((\bar{M}_{16})^{(2)})_2 / (a'_{18})^{(2)}$$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively.

Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below.

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(2)}((G_{19})(t), t)) = (b'_{17})^{(2)}$ then $T_{17} \rightarrow \infty$.

Definition of $(m)^{(2)}$ and ε_2 :

Indeed let t_2 be so that for $t > t_2$

$$(b_{17})^{(2)} - (b''_i)^{(2)}((G_{19})(t), t) < \varepsilon_2, T_{16}(t) > (m)^{(2)} -$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)}(m)^{(2)} - \varepsilon_2 T_{17}$ which leads to

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results -}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{2} \right), t = \log \frac{2}{\varepsilon_2} \text{ By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The same property}$$

holds for T_{18} if $\lim_{t \rightarrow \infty} (b''_{18})^{(2)}((G_{19})(t), t) = (b'_{18})^{(2)}$

We now state a more precise theorem about the behaviors at infinity of the solutions -

It is now sufficient to take $\frac{(a_i)^{(3)}}{(M_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(M_{20})^{(3)}} < 1$ and to choose

$(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ large to have-

$$\frac{(a_i)^{(3)}}{(M_{20})^{(3)}} \left[(\hat{P}_{20})^{(3)} + ((\hat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\hat{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{20})^{(3)} -$$

$$\frac{(b_i)^{(3)}}{(M_{20})^{(3)}} \left[((\hat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{20})^{(3)} \right] \leq (\hat{Q}_{20})^{(3)} -$$

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric

$$d(((G_{23})^{(1)}, (T_{23})^{(1)}), ((G_{23})^{(2)}, (T_{23})^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{20})^{(3)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{20})^{(3)}t} \} -$$

Indeed if we denote

$$\text{Definition of } \bar{G}_{23}, \bar{T}_{23} : ((\bar{G}_{23}), (\bar{T}_{23})) = \mathcal{A}^{(3)}((G_{23}), (T_{23})) -$$

It results

$$|\bar{G}_{20}^{(1)} - \bar{G}_i^{(2)}| \leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} ds_{(20)} + \int_0^t \{ (a'_{20})^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{-(\bar{M}_{20})^{(3)}s_{(20)}} + (a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} + G_{20}^{(2)} | (a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a''_{20})^{(3)} (T_{21}^{(2)}, s_{(20)}) | e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} \} ds_{(20)}$$

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{20})^{(3)}t} \leq \frac{1}{(\bar{M}_{20})^{(3)}} ((a_{20})^{(3)} + (a'_{20})^{(3)} + (\bar{A}_{20})^{(3)} + (\bar{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}) d((G_{23})^{(1)}, (T_{23})^{(1)}; (G_{23})^{(2)}, (T_{23})^{(2)})$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (34,35,36) the result follows-

Remark 1: The fact that we supposed $(a''_{20})^{(3)}$ and $(b''_{20})^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ and $(\bar{Q}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$, $i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(3)} - (a''_i)^{(3)} (T_{21}(s_{(20)}), s_{(20)}) \} ds_{(20)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(3)}t} > 0 \text{ for } t > 0$$

Definition of $(\bar{M}_{20})^{(3)}_1, (\bar{M}_{20})^{(3)}_2$ and $(\bar{M}_{20})^{(3)}_3$:

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$$G_{20} < (\bar{M}_{20})^{(3)} \text{ it follows } \frac{dG_{21}}{dt} \leq ((\bar{M}_{20})^{(3)}_1 - (a'_{21})^{(3)}) G_{21} \text{ and by integrating}$$

$$G_{21} \leq ((\bar{M}_{20})^{(3)}_2) = G_{21}^0 + 2(a_{21})^{(3)} ((\bar{M}_{20})^{(3)}_1) / (a'_{21})^{(3)}$$

In the same way, one can obtain

$$G_{22} \leq ((\bar{M}_{20})^{(3)}_3) = G_{22}^0 + 2(a_{22})^{(3)} ((\bar{M}_{20})^{(3)}_2) / (a'_{22})^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively.

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below.

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(3)} ((G_{23})(t), t)) = (b'_{21})^{(3)}$ then $T_{21} \rightarrow \infty$.

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$

$$(b_{21})^{(3)} - (b''_i)^{(3)} ((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)}$$

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)} (m)^{(3)} - \varepsilon_3 T_{21}$ which leads to

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$$T_{21} \geq \left(\frac{(a_{21})^{(3)} (m)^{(3)}}{2} \right), t = \log \frac{2}{\varepsilon_3} \text{ By taking now } \varepsilon_3 \text{ sufficiently small one sees that } T_{21} \text{ is unbounded. The same property}$$

holds for T_{22} if $\lim_{t \rightarrow \infty} (b''_{22})^{(3)} ((G_{23})(t), t) = (b'_{22})^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions-

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} < 1$ and to choose

$(\bar{P}_{24})^{(4)}$ and $(\bar{Q}_{24})^{(4)}$ large to have-

$$\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}} \left[(\bar{P}_{24})^{(4)} + ((\bar{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\bar{P}_{24})^{(4)} + G_j^0}{G_j^0} \right)} \right] \leq (\bar{P}_{24})^{(4)}$$

$$\frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} \left[((\bar{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\bar{Q}_{24})^{(4)} + T_j^0}{T_j^0} \right)} + (\bar{Q}_{24})^{(4)} \right] \leq (\bar{Q}_{24})^{(4)}$$

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric

$$d(((G_{27})^{(1)}, (T_{27})^{(1)}), ((G_{27})^{(2)}, (T_{27})^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{24})^{(4)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{24})^{(4)}t} \}$$

Indeed if we denote

Definition of $(\overline{G_{27}}, \overline{T_{27}}) : ((\overline{G_{27}}, \overline{T_{27}})) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$

It results

$$|\overline{G_{24}}^{(1)} - \overline{G_{24}}^{(2)}| \leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\overline{M_{24}})^{(4)} s_{(24)}} e^{(\overline{M_{24}})^{(4)} s_{(24)}} ds_{(24)} + \int_0^t \{ (a'_{24})^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\overline{M_{24}})^{(4)} s_{(24)}} e^{-(\overline{M_{24}})^{(4)} s_{(24)}} + (a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\overline{M_{24}})^{(4)} s_{(24)}} e^{(\overline{M_{24}})^{(4)} s_{(24)}} + G_{24}^{(2)} | (a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) - (a''_{24})^{(4)} (T_{25}^{(2)}, s_{(24)}) | e^{-(\overline{M_{24}})^{(4)} s_{(24)}} e^{(\overline{M_{24}})^{(4)} s_{(24)}} \} ds_{(24)}$$

Where $s_{(24)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\overline{M_{24}})^{(4)} t} \leq \frac{1}{(\overline{M_{24}})^{(4)}} ((a_{24})^{(4)} + (a'_{24})^{(4)} + (\overline{A_{24}})^{(4)} + (\overline{P_{24}})^{(4)} (\overline{k_{24}})^{(4)}) d(((G_{27})^{(1)}, (T_{27})^{(1)}); (G_{27})^{(2)}, (T_{27})^{(2)})$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-

Remark 1: The fact that we supposed $(a''_{24})^{(4)}$ and $(b''_{24})^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\overline{P_{24}})^{(4)} e^{(\overline{M_{24}})^{(4)} t}$ and $(\overline{Q_{24}})^{(4)} e^{(\overline{M_{24}})^{(4)} t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(4)}$ and $(b''_i)^{(4)}$, $i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From THE CONCATENATED SYTEM OF GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(4)} - (a''_i)^{(4)} (T_{25}(s_{(24)}), s_{(24)}) \} ds_{(24)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(4)} t} > 0 \text{ for } t > 0$$

Definition of $((\overline{M_{24}})^{(4)})_1, ((\overline{M_{24}})^{(4)})_2$ and $((\overline{M_{24}})^{(4)})_3$:

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$$G_{24} < (\overline{M_{24}})^{(4)} \text{ it follows } \frac{dG_{25}}{dt} \leq ((\overline{M_{24}})^{(4)})_1 - (a'_{25})^{(4)} G_{25} \text{ and by integrating}$$

$$G_{25} \leq ((\overline{M_{24}})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)} ((\overline{M_{24}})^{(4)})_1 / (a'_{25})^{(4)}$$

In the same way, one can obtain

$$G_{26} \leq ((\overline{M_{24}})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)} ((\overline{M_{24}})^{(4)})_2 / (a'_{26})^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24} , G_{26} and G_{24} , G_{25} respectively.

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below.

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(4)} ((G_{27})(t), t)) = (b'_{25})^{(4)}$ then $T_{25} \rightarrow \infty$.

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25})^{(4)} - (b'_i)^{(4)} ((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)} :$$

Then $\frac{dT_{25}}{dt} \geq (a_{25})^{(4)} (m)^{(4)} - \varepsilon_4 T_{25}$ which leads to

$$T_{25} \geq \left(\frac{(a_{25})^{(4)} (m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$$T_{25} \geq \left(\frac{(a_{25})^{(4)} (m)^{(4)}}{2} \right), t = \log \frac{2}{\varepsilon_4} \text{ By taking now } \varepsilon_4 \text{ sufficiently small one sees that } T_{25} \text{ is unbounded. The same property}$$

holds for T_{26} if $\lim_{t \rightarrow \infty} (b'_{26})^{(4)} ((G_{27})(t), t) = (b'_{26})^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ANALOGOUS inequalities hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$:

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\overline{M_{28}})^{(5)}} , \frac{(b_i)^{(5)}}{(\overline{M_{28}})^{(5)}} < 1$ and to choose

$(\overline{P_{28}})^{(5)}$ and $(\overline{Q_{28}})^{(5)}$ large to have-

$$\frac{(a_i)^{(5)}}{(\overline{M_{28}})^{(5)}} \left[(\overline{P_{28}})^{(5)} + ((\overline{P_{28}})^{(5)} + G_j^0) e^{-\left(\frac{(\overline{P_{28}})^{(5)} + G_j^0}{G_j^0} \right)} \right] \leq (\overline{P_{28}})^{(5)} -$$

$$\frac{(b_i)^{(5)}}{(\overline{M_{28}})^{(5)}} \left[((\overline{Q_{28}})^{(5)} + T_j^0) e^{-\left(\frac{(\overline{Q_{28}})^{(5)} + T_j^0}{T_j^0} \right)} + (\overline{Q_{28}})^{(5)} \right] \leq (\overline{Q_{28}})^{(5)} -$$

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric

$$d(((G_{31})^{(1)}, (T_{31})^{(1)}), ((G_{31})^{(2)}, (T_{31})^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t} \}$$

Indeed if we denote

Definition of $(\widehat{G}_{31}), (\widehat{T}_{31}) : ((\widehat{G}_{31}), (\widehat{T}_{31})) = \mathcal{A}^{(5)}((G_{31}), (T_{31}))$

It results

$$|\widehat{G}_{28}^{(1)} - \widehat{G}_i^{(2)}| \leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s} e^{(\widehat{M}_{28})^{(5)}s} ds + \int_0^t \{ (a'_{28})^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s} e^{-(\widehat{M}_{28})^{(5)}s} + (a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s} e^{(\widehat{M}_{28})^{(5)}s} + G_{28}^{(2)} | (a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a''_{28})^{(5)} (T_{29}^{(2)}, s_{(28)}) | e^{-(\widehat{M}_{28})^{(5)}s} e^{(\widehat{M}_{28})^{(5)}s} \} ds$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$|(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\widehat{M}_{28})^{(5)}t} \leq \frac{1}{(\widehat{M}_{28})^{(5)}} ((a_{28})^{(5)} + (a'_{28})^{(5)} + (\widehat{A}_{28})^{(5)} + (\widehat{P}_{28})^{(5)} (\widehat{k}_{28})^{(5)}) d((G_{31})^{(1)}, (T_{31})^{(1)}; (G_{31})^{(2)}, (T_{31})^{(2)})$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows-

Remark 1: The fact that we supposed $(a''_{28})^{(5)}$ and $(b''_{28})^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(5)}$ and $(b''_i)^{(5)}, i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 28 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(5)} - (a''_i)^{(5)} (T_{29}(s_{(28)}), s_{(28)}) \} ds} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(5)}t} > 0 \text{ for } t > 0$$

Definition of $(\widehat{M}_{28})^{(5)}_1, (\widehat{M}_{28})^{(5)}_2$ and $(\widehat{M}_{28})^{(5)}_3 :$

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$$G_{28} < (\widehat{M}_{28})^{(5)} \text{ it follows } \frac{dG_{29}}{dt} \leq ((\widehat{M}_{28})^{(5)})_1 - (a'_{29})^{(5)} G_{29} \text{ and by integrating}$$

$$G_{29} \leq ((\widehat{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29})^{(5)} ((\widehat{M}_{28})^{(5)})_1 / (a'_{29})^{(5)}$$

In the same way, one can obtain

$$G_{30} \leq ((\widehat{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30})^{(5)} ((\widehat{M}_{28})^{(5)})_2 / (a'_{30})^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28}, G_{30} and G_{28}, G_{29} respectively.-

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below.-

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(5)} ((G_{31})(t), t)) = (b'_{29})^{(5)}$ then $T_{29} \rightarrow \infty$.

Definition of $(m)^{(5)}$ and $\varepsilon_5 :$

Indeed let t_5 be so that for $t > t_5$

$$(b_{29})^{(5)} - (b''_i)^{(5)} ((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)}$$

Then $\frac{dT_{29}}{dt} \geq (a_{29})^{(5)} (m)^{(5)} - \varepsilon_5 T_{29}$ which leads to

$$T_{29} \geq \left(\frac{(a_{29})^{(5)} (m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_5 t} = \frac{1}{2} \text{ it results}$$

$$T_{29} \geq \left(\frac{(a_{29})^{(5)} (m)^{(5)}}{2} \right), t = \log \frac{2}{\varepsilon_5} \text{ By taking now } \varepsilon_5 \text{ sufficiently small one sees that } T_{29} \text{ is unbounded. The same property}$$

holds for T_{30} if $\lim_{t \rightarrow \infty} (b''_{30})^{(5)} ((G_{31})(t), t) = (b'_{30})^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$

It is now sufficient to take $\frac{(a_i)^{(6)}}{(\widehat{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} < 1$ and to choose

$(\widehat{P}_{32})^{(6)}$ and $(\widehat{Q}_{32})^{(6)}$ large to have-

$$\frac{(a_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} \left[(\widehat{P}_{32})^{(6)} + ((\widehat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{32})^{(6)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{32})^{(6)}$$

$$\frac{(b_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} \left[((\widehat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{32})^{(6)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{32})^{(6)} \right] \leq (\widehat{Q}_{32})^{(6)}$$

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself-

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric

$$d\left(\left((G_{35})^{(1)}, (T_{35})^{(1)}\right), \left((G_{35})^{(2)}, (T_{35})^{(2)}\right)\right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{32})^{(6)}t} \right\}$$

Indeed if we denote

$$\widehat{(G_{35})}, \widehat{(T_{35})} : \left(\widehat{(G_{35})}, \widehat{(T_{35})} \right) = \mathcal{A}^{(6)}\left((G_{35}), (T_{35})\right)$$

It results

$$\begin{aligned} |\widehat{G}_{32}^{(1)} - \widehat{G}_i^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} ds_{(32)} + \\ &\int_0^t \{ (a'_{32})^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{-(M_{32})^{(6)}s_{(32)}} + \\ &(a''_{32})^{(6)} (T_{33}^{(1)}, s_{(32)}) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} + \\ &G_{32}^{(2)} | (a''_{32})^{(6)} (T_{33}^{(1)}, s_{(32)}) - (a''_{32})^{(6)} (T_{33}^{(2)}, s_{(32)}) | e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} \} ds_{(32)} \end{aligned}$$

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows-

$$\begin{aligned} |(G_{35})^{(1)} - (G_{35})^{(2)}| e^{-(M_{32})^{(6)}t} &\leq \\ \frac{1}{(M_{32})^{(6)}} \left((a_{32})^{(6)} + (a'_{32})^{(6)} + (\widehat{A}_{32})^{(6)} + (\widehat{P}_{32})^{(6)} (\widehat{K}_{32})^{(6)} \right) &d\left(\left((G_{35})^{(1)}, (T_{35})^{(1)}\right); \left((G_{35})^{(2)}, (T_{35})^{(2)}\right)\right) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows-

Remark 1: The fact that we supposed $(a'_{32})^{(6)}$ and $(b'_{32})^{(6)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{32})^{(6)} e^{(M_{32})^{(6)}t}$ and $(\widehat{Q}_{32})^{(6)} e^{(M_{32})^{(6)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(6)}$ and $(b''_i)^{(6)}$, $i = 32, 33, 34$ depend only on T_{33} and respectively on (G_{35}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.-

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 69 to 32 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(6)} - (a''_i)^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \} ds_{(32)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(6)}t} > 0 \text{ for } t > 0-$$

Definition of $((\widehat{M}_{32})^{(6)})_1, ((\widehat{M}_{32})^{(6)})_2$ and $((\widehat{M}_{32})^{(6)})_3$:

Remark 3: if G_{32} is bounded, the same property have also G_{33} and G_{34} . indeed if

$$G_{32} < (\widehat{M}_{32})^{(6)} \text{ it follows } \frac{dG_{33}}{dt} \leq ((\widehat{M}_{32})^{(6)})_1 - (a'_{33})^{(6)} G_{33} \text{ and by integrating}$$

$$G_{33} \leq ((\widehat{M}_{32})^{(6)})_2 = G_{33}^0 + 2(a_{33})^{(6)} ((\widehat{M}_{32})^{(6)})_1 / (a'_{33})^{(6)}$$

In the same way, one can obtain

$$G_{34} \leq ((\widehat{M}_{32})^{(6)})_3 = G_{34}^0 + 2(a_{34})^{(6)} ((\widehat{M}_{32})^{(6)})_2 / (a'_{34})^{(6)}$$

If G_{33} or G_{34} is bounded, the same property follows for G_{32} , G_{34} and G_{32} , G_{33} respectively.-

Remark 4: If G_{32} is bounded, from below, the same property holds for G_{33} and G_{34} . The proof is analogous with the preceding one. An analogous property is true if G_{33} is bounded from below.-

Remark 5: If T_{32} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(6)} ((G_{35})(t), t)) = (b'_{33})^{(6)}$ then $T_{33} \rightarrow \infty$.

Definition of $(m)^{(6)}$ and ε_6 :

Indeed let t_6 be so that for $t > t_6$

$$(b_{33})^{(6)} - (b'_i)^{(6)} ((G_{35})(t), t) < \varepsilon_6, T_{32}(t) > (m)^{(6)}_-$$

Then $\frac{dT_{33}}{dt} \geq (a_{33})^{(6)} (m)^{(6)} - \varepsilon_6 T_{33}$ which leads to

$$T_{33} \geq \left(\frac{(a_{33})^{(6)} (m)^{(6)}}{\varepsilon_6} \right) (1 - e^{-\varepsilon_6 t}) + T_{33}^0 e^{-\varepsilon_6 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_6 t} = \frac{1}{2} \text{ it results}$$

$$T_{33} \geq \left(\frac{(a_{33})^{(6)} (m)^{(6)}}{2} \right), t = \log \frac{2}{\varepsilon_6} \text{ By taking now } \varepsilon_6 \text{ sufficiently small one sees that } T_{33} \text{ is unbounded. The same property}$$

holds for T_{34} if $\lim_{t \rightarrow \infty} (b'_{34})^{(6)} ((G_{35})(t), t) = (b'_{34})^{(6)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of the system-

Behavior of the solutions

Theorem 2: If we denote and define

$$\text{Definition of } (\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)} :$$

(a) $(\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)}$ four constants satisfying

$$-(\sigma_2)^{(1)} \leq -(a'_{13})^{(1)} + (a'_{14})^{(1)} - (a''_{13})^{(1)} (T_{14}, t) + (a''_{14})^{(1)} (T_{14}, t) \leq -(\sigma_1)^{(1)}$$

$$-(\tau_2)^{(1)} \leq -(b'_{13})^{(1)} + (b'_{14})^{(1)} - (b''_{13})^{(1)} (G, t) - (b''_{14})^{(1)} (G, t) \leq -(\tau_1)^{(1)} -$$

Definition of $(v_1)^{(1)}, (v_2)^{(1)}, (u_1)^{(1)}, (u_2)^{(1)}, v^{(1)}, u^{(1)} :$

By $(v_1)^{(1)} > 0, (v_2)^{(1)} < 0$ and respectively $(u_1)^{(1)} > 0, (u_2)^{(1)} < 0$ the roots of the equations $(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0$ and $(b_{14})^{(1)}(u^{(1)})^2 + (\tau_1)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$:

Definition of $(\bar{v}_1)^{(1)}, (\bar{v}_2)^{(1)}, (\bar{u}_1)^{(1)}, (\bar{u}_2)^{(1)}$:

By $(\bar{v}_1)^{(1)} > 0, (\bar{v}_2)^{(1)} < 0$ and respectively $(\bar{u}_1)^{(1)} > 0, (\bar{u}_2)^{(1)} < 0$ the roots of the equations $(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0$ and $(b_{14})^{(1)}(u^{(1)})^2 + (\tau_2)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$ -

Definition of $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}, (v_0)^{(1)}$:-

(b) If we define $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}$ by
 $(m_2)^{(1)} = (v_0)^{(1)}, (m_1)^{(1)} = (v_1)^{(1)}$, if $(v_0)^{(1)} < (v_1)^{(1)}$
 $(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (\bar{v}_1)^{(1)}$, if $(v_1)^{(1)} < (v_0)^{(1)} < (\bar{v}_1)^{(1)}$,

and $(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}$

$(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (v_0)^{(1)}$, if $(\bar{v}_1)^{(1)} < (v_0)^{(1)}$:

and analogously

$(\mu_2)^{(1)} = (u_0)^{(1)}, (\mu_1)^{(1)} = (u_1)^{(1)}$, if $(u_0)^{(1)} < (u_1)^{(1)}$

$(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (\bar{u}_1)^{(1)}$, if $(u_1)^{(1)} < (u_0)^{(1)} < (\bar{u}_1)^{(1)}$,

and $(u_0)^{(1)} = \frac{T_{13}^0}{T_{14}^0}$

$(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (u_0)^{(1)}$, if $(\bar{u}_1)^{(1)} < (u_0)^{(1)}$ where $(u_1)^{(1)}, (\bar{u}_1)^{(1)}$

are defined respectively:

Then the solution of CONCATENATED GLOBAL EQUATIONS satisfies the inequalities

$$G_{13}^0 e^{((S_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{13}(t) \leq G_{13}^0 e^{(S_1)^{(1)}t}$$

where $(p_i)^{(1)}$ is defined by equation 25

$$\frac{1}{(m_1)^{(1)}} G_{13}^0 e^{((S_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{14}(t) \leq \frac{1}{(m_2)^{(1)}} G_{13}^0 e^{(S_1)^{(1)}t} -$$

$$\left(\frac{(a_{15})^{(1)} G_{13}^0}{(m_1)^{(1)} ((S_1)^{(1)} - (p_{13})^{(1)} - (S_2)^{(1)})} \left[e^{((S_1)^{(1)} - (p_{13})^{(1)})t} - e^{-(S_2)^{(1)}t} \right] + G_{15}^0 e^{-(S_2)^{(1)}t} \leq G_{15}(t) \leq \frac{(a_{15})^{(1)} G_{13}^0}{(m_2)^{(1)} ((S_1)^{(1)} - (a_{15})^{(1)})} \left[e^{(S_1)^{(1)}t} - e^{-(a_{15})^{(1)}t} \right] + G_{15}^0 e^{-(a_{15})^{(1)}t} \right) -$$

$$\left(\frac{T_{13}^0 e^{(R_1)^{(1)}t} \leq T_{13}(t) \leq T_{13}^0 e^{((R_1)^{(1)} + (r_{13})^{(1)})t} \right) -$$

$$\frac{1}{(\mu_1)^{(1)}} T_{13}^0 e^{(R_1)^{(1)}t} \leq T_{13}(t) \leq \frac{1}{(\mu_2)^{(1)}} T_{13}^0 e^{((R_1)^{(1)} + (r_{13})^{(1)})t} -$$

$$\frac{(b_{15})^{(1)} T_{13}^0}{(\mu_1)^{(1)} ((R_1)^{(1)} - (b_{15})^{(1)})} \left[e^{(R_1)^{(1)}t} - e^{-(b_{15})^{(1)}t} \right] + T_{15}^0 e^{-(b_{15})^{(1)}t} \leq T_{15}(t) \leq$$

$$\frac{(a_{15})^{(1)} T_{13}^0}{(\mu_2)^{(1)} ((R_1)^{(1)} + (r_{13})^{(1)} + (R_2)^{(1)})} \left[e^{((R_1)^{(1)} + (r_{13})^{(1)})t} - e^{-(R_2)^{(1)}t} \right] + T_{15}^0 e^{-(R_2)^{(1)}t} -$$

Definition of $(S_1)^{(1)}, (S_2)^{(1)}, (R_1)^{(1)}, (R_2)^{(1)}$:-

Where $(S_1)^{(1)} = (a_{13})^{(1)}(m_2)^{(1)} - (a_{13})^{(1)}$

$(S_2)^{(1)} = (a_{15})^{(1)} - (p_{15})^{(1)}$

$(R_1)^{(1)} = (b_{13})^{(1)}(\mu_2)^{(1)} - (b_{13})^{(1)}$

$(R_2)^{(1)} = (b_{15})^{(1)} - (r_{15})^{(1)}$ -

Behavior of the solutions

If we denote and define-

Definition of $(\sigma_1)^{(2)}, (\sigma_2)^{(2)}, (\tau_1)^{(2)}, (\tau_2)^{(2)}$:

$(\sigma_1)^{(2)}, (\sigma_2)^{(2)}, (\tau_1)^{(2)}, (\tau_2)^{(2)}$ four constants satisfying-

$$-(\sigma_2)^{(2)} \leq -(a'_{16})^{(2)} + (a'_{17})^{(2)} - (a''_{16})^{(2)}(T_{17}, t) + (a''_{17})^{(2)}(T_{17}, t) \leq -(\sigma_1)^{(2)} -$$

$$-(\tau_2)^{(2)} \leq -(b'_{16})^{(2)} + (b'_{17})^{(2)} - (b''_{16})^{(2)}(G_{19}, t) - (b''_{17})^{(2)}(G_{19}, t) \leq -(\tau_1)^{(2)} -$$

Definition of $(v_1)^{(2)}, (v_2)^{(2)}, (u_1)^{(2)}, (u_2)^{(2)}$:-

By $(v_1)^{(2)} > 0, (v_2)^{(2)} < 0$ and respectively $(u_1)^{(2)} > 0, (u_2)^{(2)} < 0$ the roots-

of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ -

and $(b_{14})^{(2)}(u^{(2)})^2 + (\tau_1)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ and-

Definition of $(\bar{v}_1)^{(2)}, (\bar{v}_2)^{(2)}, (\bar{u}_1)^{(2)}, (\bar{u}_2)^{(2)}$:-

By $(\bar{v}_1)^{(2)} > 0, (\bar{v}_2)^{(2)} < 0$ and respectively $(\bar{u}_1)^{(2)} > 0, (\bar{u}_2)^{(2)} < 0$ the-

roots of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ -

and $(b_{17})^{(2)}(u^{(2)})^2 + (\tau_2)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ -

Definition of $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$:-

If we define $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$ by-

$(m_2)^{(2)} = (v_0)^{(2)}, (m_1)^{(2)} = (v_1)^{(2)}$, if $(v_0)^{(2)} < (v_1)^{(2)}$ -

$(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (\bar{v}_1)^{(2)}$, if $(v_1)^{(2)} < (v_0)^{(2)} < (\bar{v}_1)^{(2)}$,

and
$$(v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} -$$

$(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (v_0)^{(2)}, \text{ if } (\bar{v}_1)^{(2)} < (v_0)^{(2)} -$

and analogously

$(\mu_2)^{(2)} = (u_0)^{(2)}, (\mu_1)^{(2)} = (u_1)^{(2)}, \text{ if } (u_0)^{(2)} < (u_1)^{(2)}$
 $(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (\bar{u}_1)^{(2)}, \text{ if } (u_1)^{(2)} < (u_0)^{(2)} < (\bar{u}_1)^{(2)},$

and
$$(u_0)^{(2)} = \frac{T_{16}^0}{T_{17}^0} -$$

$(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (u_0)^{(2)}, \text{ if } (\bar{u}_1)^{(2)} < (u_0)^{(2)} -$

Then the solution of CONCATENATED GLOBAL EQUATIONS satisfies the inequalities

$$\text{and } (b_{33})^{(6)}(u^{(6)})^2 + (\tau_2)^{(6)}u^{(6)} - (b_{32})^{(6)} = 0$$

Definition of $(m_1)^{(6)}, (m_2)^{(6)}, (\mu_1)^{(6)}, (\mu_2)^{(6)}, (v_0)^{(6)}$:-

(1) If we define $(m_1)^{(6)}, (m_2)^{(6)}, (\mu_1)^{(6)}, (\mu_2)^{(6)}$ by $(m_2)^{(6)} = (v_0)^{(6)}, (m_1)^{(6)} = (v_1)^{(6)}$, **if** $(v_0)^{(6)} < (v_1)^{(6)}$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (\bar{v}_6)^{(6)}, \text{ if } (v_1)^{(6)} < (v_0)^{(6)} < (\bar{v}_1)^{(6)}, \text{ and } (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}$$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (v_0)^{(6)}, \text{ if } (\bar{v}_1)^{(6)} < (v_0)^{(6)}$$

and analogously

$$(\mu_2)^{(6)} = (u_0)^{(6)}, (\mu_1)^{(6)} = (u_1)^{(6)}, \text{ if } (u_0)^{(6)} < (u_1)^{(6)}$$

$$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (\bar{u}_1)^{(6)}, \text{ if } (u_1)^{(6)} < (u_0)^{(6)} < (\bar{u}_1)^{(6)}, \text{ and } (u_0)^{(6)} = \frac{T_{32}^0}{T_{33}^0}$$

$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (u_0)^{(6)}$, **if** $(\bar{u}_1)^{(6)} < (u_0)^{(6)}$ where $(u_1)^{(6)}, (\bar{u}_1)^{(6)}$ are defined respectively

Then the solution of CONCATENATED SYSTEM OF GLOBAL EQUATIONS satisfies the inequalities

$$G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{32}(t) \leq G_{32}^0 e^{(S_1)^{(6)}t}$$

where $(p_i)^{(6)}$ is defined

$$\frac{1}{(m_1)^{(6)}} G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{32}(t) \leq \frac{1}{(m_2)^{(6)}} G_{32}^0 e^{(S_1)^{(6)}t}$$

$$\left(\frac{(a_{34})^{(6)} G_{32}^0}{(m_1)^{(6)} ((S_1)^{(6)} - (p_{32})^{(6)} - (S_2)^{(6)})} \left[e^{((S_1)^{(6)} - (p_{32})^{(6)})t} - e^{-(S_2)^{(6)}t} \right] + G_{34}^0 e^{-(S_2)^{(6)}t} \right) \leq G_{34}(t) \leq (a_{34})^{(6)} G_{32}^0 (m_2)^{(6)} (S_1)^{(6)} - (a_{34})^{(6)} G_{32}^0 (S_1)^{(6)} t - e^{-(a_{34})^{(6)} t} + G_{34}^0 e^{-(a_{34})^{(6)} t}$$

$$T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t}$$

$$\frac{1}{(\mu_1)^{(6)}} T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq \frac{1}{(\mu_2)^{(6)}} T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t}$$

$$\frac{(b_{34})^{(6)} T_{32}^0}{(\mu_1)^{(6)} ((R_1)^{(6)} - (b_{34})^{(6)})} \left[e^{(R_1)^{(6)}t} - e^{-(b_{34})^{(6)}t} \right] + T_{34}^0 e^{-(b_{34})^{(6)}t} \leq T_{34}(t) \leq$$

$$\frac{(a_{34})^{(6)} T_{32}^0}{(\mu_2)^{(6)} ((R_1)^{(6)} + (r_{32})^{(6)} + (R_2)^{(6)})} \left[e^{((R_1)^{(6)} + (r_{32})^{(6)})t} - e^{-(R_2)^{(6)}t} \right] + T_{34}^0 e^{-(R_2)^{(6)}t}$$

Definition of $(S_1)^{(6)}, (S_2)^{(6)}, (R_1)^{(6)}, (R_2)^{(6)}$:-

Where $(S_1)^{(6)} = (a_{32})^{(6)}(m_2)^{(6)} - (a'_{32})^{(6)}$

$$(S_2)^{(6)} = (a_{34})^{(6)} - (p_{34})^{(6)}$$

$$(R_1)^{(6)} = (b_{32})^{(6)}(\mu_2)^{(6)} - (b'_{32})^{(6)}$$

$$(R_2)^{(6)} = (b_{34})^{(6)} - (r_{34})^{(6)}$$

Proof : From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a'_{13})^{(1)} - (a'_{14})^{(1)} + (a''_{13})^{(1)}(T_{14}, t) \right) - (a''_{14})^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $v^{(1)} = \frac{G_{13}}{G_{14}}$

It follows

$$- \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} \right) \leq \frac{dv^{(1)}}{dt} \leq - \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

(a) For $0 < (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \geq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}]t}}, \quad (C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}$$

it follows $(v_0)^{(1)} \leq v^{(1)}(t) \leq (v_1)^{(1)}$

In the same manner, we get

$$v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}, \quad (\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}$$

From which we deduce $(v_0)^{(1)} \leq v^{(1)}(t) \leq (\bar{v}_1)^{(1)}$

(b) If $0 < (v_1)^{(1)} < (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{v}_1)^{(1)}$ we find like in the previous case,

$$(v_1)^{(1)} \leq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_2)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(v_1)^{(1)} - (v_2)^{(1)}]t}} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (C)^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}} \leq (\bar{v}_1)^{(1)}$$

(c) If $0 < (v_1)^{(1)} \leq (\bar{v}_1)^{(1)} \leq (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}$, we obtain

$$(v_1)^{(1)} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (C)^{(1)}(\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}}{1 + (C)^{(1)} e^{[-(a_{14})^{(1)}(\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}]t}} \leq (v_0)^{(1)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)} \leq v^{(1)}(t) \leq (m_1)^{(1)}, \quad v^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}$$

Now, using this result and replacing it in CONCATENATED GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{13}^{(1)}) = (a_{14}^{(1)})$, then $(\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(v_1)^{(1)} = (\bar{v}_1)^{(1)}$ if in addition $(v_0)^{(1)} = (v_1)^{(1)}$ then $v^{(1)}(t) = (v_0)^{(1)}$ and as a consequence $G_{13}(t) = (v_0)^{(1)}G_{14}(t)$ this also defines $(v_0)^{(1)}$ for the special case

Analogously if $(b_{13}^{(1)}) = (b_{14}^{(1)})$, then $(\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$ if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)}T_{14}(t)$ This is an important consequence of the relation between $(v_1)^{(1)}$ and $(\bar{v}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

From CONCATENATED SYSTEM OF GLOBAL EQUATIONS we obtain

$$\frac{dv^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)}(T_{17}, t) \right) - (a''_{17})^{(2)}(T_{17}, t)v^{(2)} - (a_{17})^{(2)}v^{(2)}$$

Definition of $v^{(2)}$:-

$$v^{(2)} = \frac{G_{16}}{G_{17}}$$

It follows

$$- \left((a_{17})^{(2)}(v^{(2)})^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)} \right) \leq \frac{dv^{(2)}}{dt} \leq - \left((a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(2)}, (v_0)^{(2)}$:-

(d) For $0 < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (v_1)^{(2)} < (\bar{v}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_0)^{(2)}]t}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_0)^{(2)}]t}}, \quad (C)^{(2)} = \frac{(v_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (v_2)^{(2)}}$$

it follows $(v_0)^{(2)} \leq v^{(2)}(t) \leq (v_1)^{(2)}$

In the same manner, we get

$$v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}, \quad (\bar{C})^{(2)} = \frac{(\bar{v}_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (\bar{v}_2)^{(2)}}$$

From which we deduce $(v_0)^{(2)} \leq v^{(2)}(t) \leq (\bar{v}_1)^{(2)}$

(e) If $0 < (v_1)^{(2)} < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\bar{v}_1)^{(2)}$ we find like in the previous case,

$$(v_1)^{(2)} \leq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_2)^{(2)}]t}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}(v_1)^{(2)} - (v_2)^{(2)}]t}} \leq v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}} \leq (\bar{v}_1)^{(2)}$$

(f) If $0 < (v_1)^{(2)} \leq (\bar{v}_1)^{(2)} \leq (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0}$, we obtain

$$(v_1)^{(2)} \leq v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}(\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)}]t}} \leq (v_0)^{(2)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(2)}(t)$:-

$$(m_2)^{(2)} \leq v^{(2)}(t) \leq (m_1)^{(2)}, \quad v^{(2)}(t) = \frac{G_{16}(t)}{G_{17}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(2)}(t)$:-

$$(\mu_2)^{(2)} \leq u^{(2)}(t) \leq (\mu_1)^{(2)}, \quad u^{(2)}(t) = \frac{T_{16}(t)}{T_{17}(t)}$$

Now, using this result and replacing it in CONCATENATED SYSTEM OF GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{16})^{(2)} = (a''_{17})^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)}G_{17}(t)$

Analogously if $(b''_{16})^{(2)} = (b''_{17})^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)}T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$

: From CONCATENATED GLOBAL EQUATIONS we obtain

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a'_{20})^{(3)} - (a'_{21})^{(3)} + (a''_{20})^{(3)}(T_{21}, t) \right) - (a''_{21})^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)}$$

Definition of $v^{(3)}$:-

$$v^{(3)} = \frac{G_{20}}{G_{21}}$$

It follows

$$- \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)} \right) \leq \frac{dv^{(3)}}{dt} \leq - \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)} \right)$$

From which one obtains

(a) For $0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}} , \quad (C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}$$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$

In the same manner, we get

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} , \quad (\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}$$

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case,

$$(v_1)^{(3)} \leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}} \leq v^{(3)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (\bar{v}_1)^{(3)}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{20})^{(3)} = (a''_{21})^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)}G_{21}(t)$

Analogously if $(b''_{20})^{(3)} = (b''_{21})^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$

: From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25}, t) \right) - (a''_{25})^{(4)}(T_{25}, t)v^{(4)} - (a_{25})^{(4)}v^{(4)}$$

Definition of $v^{(4)}$:-
$$v^{(4)} = \frac{G_{24}}{G_{25}}$$

It follows

$$-\left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_2)^{(4)}v^{(4)} - (a_{24})^{(4)}\right) \leq \frac{dv^{(4)}}{dt} \leq -\left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_4)^{(4)}v^{(4)} - (a_{24})^{(4)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \frac{G_{24}^0}{G_{25}^0} < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)}e^{[-(a_{25})^{(4)}(v_1)^{(4)} - (v_0)^{(4)}]t}}{4 + (C)^{(4)}e^{[-(a_{25})^{(4)}(v_1)^{(4)} - (v_0)^{(4)}]t}}, \quad (C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}}$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner, we get

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}}{4 + (\bar{C})^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}}, \quad (\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case,

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)}e^{[-(a_{25})^{(4)}(v_1)^{(4)} - (v_2)^{(4)}]t}}{1 + (C)^{(4)}e^{[-(a_{25})^{(4)}(v_1)^{(4)} - (v_2)^{(4)}]t}} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}}{1 + (\bar{C})^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}} \leq (\bar{v}_1)^{(4)}$$

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \frac{G_{24}^0}{G_{25}^0}$, we obtain

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}}{1 + (\bar{C})^{(4)}e^{[-(a_{25})^{(4)}(\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)}]t}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(4)}(t)$:-

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)}, \quad v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t)$:-

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{24}^{(4)})'' = (a_{25}^{(4)})''$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case.**

Analogously if $(b_{24}^{(4)})'' = (b_{25}^{(4)})''$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then

$(u_1)^{(4)} = (\bar{u}_4)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)}$:-
$$v^{(5)} = \frac{G_{28}}{G_{29}}$$

It follows

$$-\left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)}\right) \leq \frac{dv^{(5)}}{dt} \leq -\left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)}$:-

(g) For $0 < \frac{G_{28}^0}{G_{29}^0} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)}e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)}e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad (C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner, we get

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)}e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{5 + (\bar{C})^{(5)}e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}, \quad (\bar{C})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_1)^{(5)}$

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case,

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (\bar{v}_1)^{(5)}$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}$, we obtain

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (v_0)^{(5)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}$$

Now, using this result and replacing it in CONCATENATED GOVERNING EQUATIONS OF THE GLOBAL SYSTEM we get easily the result stated in the theorem.

Particular case :

If $(a_{28}^{''})^{(5)} = (a_{29}^{''})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)}G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case .**

Analogously if $(b_{28}^{''})^{(5)} = (b_{29}^{''})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then

$(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)}T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$.**

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a_{32}')^{(6)} - (a_{33}')^{(6)} + (a_{32}'')^{(6)}(T_{33}, t) \right) - (a_{33}'')^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $v^{(6)} = \frac{G_{32}}{G_{33}}$

It follows

$$- \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_2)^{(6)}v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_1)^{(6)}v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

(j) For $0 < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}, \quad (C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner, we get

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}, \quad (\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case,

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (C)^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (\bar{v}_1)^{(6)}$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}$, we obtain

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)}, \quad v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)}, \quad u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{32})^{(6)} = (a''_{33})^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)}G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b''_{32})^{(6)} = (b''_{33})^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then

$(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)}T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

We can prove the following

Theorem 3: If $(a'_i)^{(1)}$ and $(b'_i)^{(1)}$ are independent on t , and the conditions (with the notations 25,26,27,28)

$$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} < 0$$

$$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} + (a_{13})^{(1)}(p_{13})^{(1)} + (a'_{14})^{(1)}(p_{14})^{(1)} + (p_{13})^{(1)}(p_{14})^{(1)} > 0$$

$$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} > 0,$$

$$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} - (b'_{13})^{(1)}(r_{14})^{(1)} - (b'_{14})^{(1)}(r_{14})^{(1)} + (r_{13})^{(1)}(r_{14})^{(1)} < 0$$

with $(p_{13})^{(1)}, (r_{14})^{(1)}$ as defined are satisfied, then the system

If $(a''_i)^{(2)}$ and $(b''_i)^{(2)}$ are independent on t , and the conditions

$$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} < 0$$

$$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} + (a_{16})^{(2)}(p_{16})^{(2)} + (a'_{17})^{(2)}(p_{17})^{(2)} + (p_{16})^{(2)}(p_{17})^{(2)} > 0$$

$$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} > 0,$$

$$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} - (b'_{16})^{(2)}(r_{17})^{(2)} - (b'_{17})^{(2)}(r_{17})^{(2)} + (r_{16})^{(2)}(r_{17})^{(2)} < 0$$

with $(p_{16})^{(2)}, (r_{17})^{(2)}$ as defined are satisfied, then the system

If $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$ are independent on t , and the conditions

$$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} < 0$$

$$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} + (a_{20})^{(3)}(p_{20})^{(3)} + (a'_{21})^{(3)}(p_{21})^{(3)} + (p_{20})^{(3)}(p_{21})^{(3)} > 0$$

$$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} > 0,$$

$$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} - (b'_{20})^{(3)}(r_{21})^{(3)} - (b'_{21})^{(3)}(r_{21})^{(3)} + (r_{20})^{(3)}(r_{21})^{(3)} < 0$$

with $(p_{20})^{(3)}, (r_{21})^{(3)}$ as defined by equation 25 are satisfied, then the system

If $(a''_i)^{(4)}$ and $(b''_i)^{(4)}$ are independent on t , and the conditions WE CAN UNMISTAKABLY PROVE THAT:

$$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} < 0$$

$$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} + (a_{24})^{(4)}(p_{24})^{(4)} + (a'_{25})^{(4)}(p_{25})^{(4)} + (p_{24})^{(4)}(p_{25})^{(4)} > 0$$

$$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} > 0,$$

$$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - (b'_{24})^{(4)}(r_{25})^{(4)} - (b'_{25})^{(4)}(r_{25})^{(4)} + (r_{24})^{(4)}(r_{25})^{(4)} < 0$$

with $(p_{24})^{(4)}, (r_{25})^{(4)}$ as defined are satisfied, then the system

If $(a''_i)^{(5)}$ and $(b''_i)^{(5)}$ are independent on t , and the conditions

$$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} < 0$$

$$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} + (a_{28})^{(5)}(p_{28})^{(5)} + (a'_{29})^{(5)}(p_{29})^{(5)} + (p_{28})^{(5)}(p_{29})^{(5)} > 0$$

$$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} > 0,$$

$$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - (b'_{28})^{(5)}(r_{29})^{(5)} - (b'_{29})^{(5)}(r_{29})^{(5)} + (r_{28})^{(5)}(r_{29})^{(5)} < 0$$

with $(p_{28})^{(5)}, (r_{29})^{(5)}$ as defined are satisfied, then the system

If $(a''_i)^{(6)}$ and $(b''_i)^{(6)}$ are independent on t , and the conditions

$$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} < 0$$

$$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} + (a_{32})^{(6)}(p_{32})^{(6)} + (a'_{33})^{(6)}(p_{33})^{(6)} + (p_{32})^{(6)}(p_{33})^{(6)} > 0$$

$$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} > 0,$$

$$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - (b'_{32})^{(6)}(r_{33})^{(6)} - (b'_{33})^{(6)}(r_{33})^{(6)} + (r_{32})^{(6)}(r_{33})^{(6)} < 0$$

with $(p_{32})^{(6)}, (r_{33})^{(6)}$ as defined are satisfied, then the system

$$(a_{13})^{(1)}G_{14} - [(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14})]G_{13} = 0$$

$$(a_{14})^{(1)}G_{13} - [(a'_{14})^{(1)} + (a''_{14})^{(1)}(T_{14})]G_{14} = 0$$

$$(a_{15})^{(1)}G_{14} - [(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14})]G_{15} = 0$$

$$(b_{13})^{(1)}T_{14} - [(b'_{13})^{(1)} - (b''_{13})^{(1)}(G)]T_{13} = 0$$

$$(b_{14})^{(1)}T_{13} - [(b'_{14})^{(1)} - (b''_{14})^{(1)}(G)]T_{14} = 0$$

$$(b_{15})^{(1)}T_{14} - [(b'_{15})^{(1)} - (b''_{15})^{(1)}(G)]T_{15} = 0$$

has a unique positive solution, which is an equilibrium solution

$$(a_{16})^{(2)}G_{17} - [(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17})]G_{16} = 0$$

$$(b_{32})^{(6)}T_{33} - [(b'_{32})^{(6)} - (b''_{32})^{(6)}(G_{35})]T_{32} = 0$$

$$(b_{33})^{(6)}T_{32} - [(b'_{33})^{(6)} - (b''_{33})^{(6)}(G_{35})]T_{33} = 0$$

$$(b_{34})^{(6)}T_{33} - [(b'_{34})^{(6)} - (b''_{34})^{(6)}(G_{35})]T_{34} = 0$$

has a unique positive solution , which is an equilibrium solution for the system (GLOBAL)

Proof:

(a) Indeed the first two equations have a nontrivial solution G_{13}, G_{14} if

$$F(T) =$$

$$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} + (a'_{13})^{(1)}(a''_{14})^{(1)}(T_{14}) + (a'_{14})^{(1)}(a''_{13})^{(1)}(T_{14}) + (a''_{13})^{(1)}(T_{14})(a''_{14})^{(1)}(T_{14}) = 0$$

(a) Indeed the first two equations have a nontrivial solution G_{16}, G_{17} if

$$F(T_{19}) =$$

$$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} + (a'_{16})^{(2)}(a''_{17})^{(2)}(T_{17}) + (a'_{17})^{(2)}(a''_{16})^{(2)}(T_{17}) + (a''_{16})^{(2)}(T_{17})(a''_{17})^{(2)}(T_{17}) = 0$$

(a) Indeed the first two equations have a nontrivial solution G_{20}, G_{21} if

$$F(T_{23}) =$$

$$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} + (a'_{20})^{(3)}(a''_{21})^{(3)}(T_{21}) + (a'_{21})^{(3)}(a''_{20})^{(3)}(T_{21}) + (a''_{20})^{(3)}(T_{21})(a''_{21})^{(3)}(T_{21}) = 0$$

(a) Indeed the first two equations have a nontrivial solution G_{24}, G_{25} if

$F(T_{27}) = (a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} + (a'_{24})^{(4)}(a''_{25})^{(4)}(T_{25}) + (a'_{25})^{(4)}(a''_{24})^{(4)}(T_{25}) + (a''_{24})^{(4)}(T_{25})(a''_{25})^{(4)}(T_{25}) = 0$
 (a) Indeed the first two equations have a nontrivial solution G_{28}, G_{29} if

$F(T_{31}) = (a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} + (a'_{28})^{(5)}(a''_{29})^{(5)}(T_{29}) + (a'_{29})^{(5)}(a''_{28})^{(5)}(T_{29}) + (a''_{28})^{(5)}(T_{29})(a''_{29})^{(5)}(T_{29}) = 0$
 (a) Indeed the first two equations have a nontrivial solution G_{32}, G_{33} if

$F(T_{35}) = (a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} + (a'_{32})^{(6)}(a''_{33})^{(6)}(T_{33}) + (a'_{33})^{(6)}(a''_{32})^{(6)}(T_{33}) + (a''_{32})^{(6)}(T_{33})(a''_{33})^{(6)}(T_{33}) = 0$

Definition and uniqueness of T_{14}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(1)}(T_{14})$ being increasing, it follows that there exists a unique T_{14}^* for which $f(T_{14}^*) = 0$. With this value, we obtain from the three first equations

$$G_{13} = \frac{(a_{13})^{(1)}G_{14}}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]} , \quad G_{15} = \frac{(a_{15})^{(1)}G_{14}}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

Definition and uniqueness of T_{17}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(2)}(T_{17})$ being increasing, it follows that there exists a unique T_{17}^* for which $f(T_{17}^*) = 0$. With this value, we obtain from the three first equations

$$G_{16} = \frac{(a_{16})^{(2)}G_{17}}{[(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17}^*)]} , \quad G_{18} = \frac{(a_{18})^{(2)}G_{17}}{[(a'_{18})^{(2)} + (a''_{18})^{(2)}(T_{17}^*)]}$$

Definition and uniqueness of T_{21}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(1)}(T_{21})$ being increasing, it follows that there exists a unique T_{21}^* for which $f(T_{21}^*) = 0$. With this value, we obtain from the three first equations

$$G_{20} = \frac{(a_{20})^{(3)}G_{21}}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]} , \quad G_{22} = \frac{(a_{22})^{(3)}G_{21}}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]}$$

Definition and uniqueness of T_{25}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(4)}(T_{25})$ being increasing, it follows that there exists a unique T_{25}^* for which $f(T_{25}^*) = 0$. With this value, we obtain from the three first equations

$$G_{24} = \frac{(a_{24})^{(4)}G_{25}}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]} , \quad G_{26} = \frac{(a_{26})^{(4)}G_{25}}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

Definition and uniqueness of T_{29}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(5)}(T_{29})$ being increasing, it follows that there exists a unique T_{29}^* for which $f(T_{29}^*) = 0$. With this value, we obtain from the three first equations

$$G_{28} = \frac{(a_{28})^{(5)}G_{29}}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]} , \quad G_{30} = \frac{(a_{30})^{(5)}G_{29}}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

Definition and uniqueness of T_{33}^* :-

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(6)}(T_{33})$ being increasing, it follows that there exists a unique T_{33}^* for which $f(T_{33}^*) = 0$. With this value, we obtain from the three first equations

$$G_{32} = \frac{(a_{32})^{(6)}G_{33}}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]} , \quad G_{34} = \frac{(a_{34})^{(6)}G_{33}}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

(e) By the same argument, the equations (SOLUTIONALOF THE GLOBAL EQUATIONS) admit solutions G_{13}, G_{14} if

$$\varphi(G) = (b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} - [(b'_{13})^{(1)}(b'_{14})^{(1)}(G) + (b'_{14})^{(1)}(b''_{13})^{(1)}(G)] + (b''_{13})^{(1)}(G)(b''_{14})^{(1)}(G) = 0$$

Where in $G(G_{13}, G_{14}, G_{15}), G_{13}, G_{15}$ must be replaced by their values. It is easy to see that φ is a decreasing function in G_{14} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi(G^*) = 0$

(f) By the same argument, the equations 92,93 admit solutions G_{16}, G_{17} if

$$\varphi(G_{19}) = (b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} - [(b'_{16})^{(2)}(b'_{17})^{(2)}(G_{19}) + (b'_{17})^{(2)}(b''_{16})^{(2)}(G_{19})] + (b''_{16})^{(2)}(G_{19})(b''_{17})^{(2)}(G_{19}) = 0$$

Where in $(G_{19})(G_{16}, G_{17}, G_{18}), G_{16}, G_{18}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{17} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi((G_{19})^*) = 0$

(g) By the same argument, the equations 92,93 admit solutions G_{20}, G_{21} if

$$\varphi(G_{23}) = (b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} - [(b'_{20})^{(3)}(b'_{21})^{(3)}(G_{23}) + (b'_{21})^{(3)}(b''_{20})^{(3)}(G_{23})] + (b''_{20})^{(3)}(G_{23})(b''_{21})^{(3)}(G_{23}) = 0$$

Where in $G_{23}(G_{20}, G_{21}, G_{22}), G_{20}, G_{22}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{21} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{21}^* such that $\varphi((G_{23})^*) = 0$

(h) By the same argument, the equations SOLUTIONAL SYSTEM OF THE GLOBAL EQUATIONS admit solutions G_{24}, G_{25} if

$$\varphi(G_{27}) = (b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - [(b'_{24})^{(4)}(b'_{25})^{(4)}(G_{27}) + (b'_{25})^{(4)}(b''_{24})^{(4)}(G_{27})] + (b''_{24})^{(4)}(G_{27})(b''_{25})^{(4)}(G_{27}) = 0$$

Where in $(G_{27})(G_{24}, G_{25}, G_{26}), G_{24}, G_{26}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{25} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{25}^* such that $\varphi((G_{27})^*) = 0$

(i) By the same argument, the equations SOLUTIONAL SYSTEM OF THE GLOBAL EQUATIONS admit solutions G_{28}, G_{29} if

$$\varphi(G_{31}) = (b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - [(b'_{28})^{(5)}(b''_{29})^{(5)}(G_{31}) + (b'_{29})^{(5)}(b''_{28})^{(5)}(G_{31})] + (b''_{28})^{(5)}(G_{31})(b''_{29})^{(5)}(G_{31}) = 0$$

Where in $(G_{31})(G_{28}, G_{29}, G_{30}), G_{28}, G_{30}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{29} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{29}^* such that $\varphi((G_{31})^*) = 0$

(j) By the same argument, the equations SOLUTIONAL SYSTEM OF THE GLOBAL EQUATIONS admit solutions G_{32}, G_{33} if

$$\varphi(G_{35}) = (b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - [(b'_{32})^{(6)}(b''_{33})^{(6)}(G_{35}) + (b'_{33})^{(6)}(b''_{32})^{(6)}(G_{35})] + (b''_{32})^{(6)}(G_{35})(b''_{33})^{(6)}(G_{35}) = 0$$

Where in $(G_{35})(G_{32}, G_{33}, G_{34}), G_{32}, G_{34}$ must be replaced by their values It is easy to see that φ is a decreasing function in G_{33} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{33}^* such that $\varphi(G^*) = 0$

Finally we obtain the unique solution of THE HOLISTIC SYSTEM

G_{14}^* given by $\varphi(G^*) = 0, T_{14}^*$ given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)}G_{14}^*}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]}, \quad G_{15}^* = \frac{(a_{15})^{(1)}G_{14}^*}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

$$T_{13}^* = \frac{(b_{13})^{(1)}T_{14}^*}{[(b'_{13})^{(1)} - (b''_{13})^{(1)}(G^*)]}, \quad T_{15}^* = \frac{(b_{15})^{(1)}T_{14}^*}{[(b'_{15})^{(1)} - (b''_{15})^{(1)}(G^*)]}$$

Obviously, these values represent an equilibrium solution of THE GLOBAL SYSTEM OF GOVERNING EQUATIONS

Finally we obtain the unique solution of THE HOLISTIC SYSTEM

G_{17}^* given by $\varphi((G_{19})^*) = 0, T_{17}^*$ given by $f(T_{17}^*) = 0$ and

$$G_{16}^* = \frac{(a_{16})^{(2)}G_{17}^*}{[(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17}^*)]}, \quad G_{18}^* = \frac{(a_{18})^{(2)}G_{17}^*}{[(a'_{18})^{(2)} + (a''_{18})^{(2)}(T_{17}^*)]}$$

$$T_{16}^* = \frac{(b_{16})^{(2)}T_{17}^*}{[(b'_{16})^{(2)} - (b''_{16})^{(2)}((G_{19})^*)]}, \quad T_{18}^* = \frac{(b_{18})^{(2)}T_{17}^*}{[(b'_{18})^{(2)} - (b''_{18})^{(2)}((G_{19})^*)]}$$

Obviously, these values represent an equilibrium solution of THE HOLISTIC SYSTEM

Finally we obtain the unique solution of SOLUTIONAL EQUATIONS OF THE GLOBAL SYSTEM

G_{21}^* given by $\varphi((G_{23})^*) = 0, T_{21}^*$ given by $f(T_{21}^*) = 0$ and

$$G_{20}^* = \frac{(a_{20})^{(3)}G_{21}^*}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]}, \quad G_{22}^* = \frac{(a_{22})^{(3)}G_{21}^*}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]}$$

$$T_{20}^* = \frac{(b_{20})^{(3)}T_{21}^*}{[(b'_{20})^{(3)} - (b''_{20})^{(3)}(G_{23}^*)]}, \quad T_{22}^* = \frac{(b_{22})^{(3)}T_{21}^*}{[(b'_{22})^{(3)} - (b''_{22})^{(3)}(G_{23}^*)]}$$

Obviously, these values represent an equilibrium solution of THE GLOBAL GOVERNING EQUATIONS

Finally we obtain the unique solution of SOLUTIONS FOR THE GLOBAL GOVERNING EQUATIONS

G_{25}^* given by $\varphi(G_{27}) = 0, T_{25}^*$ given by $f(T_{25}^*) = 0$ and

$$G_{24}^* = \frac{(a_{24})^{(4)}G_{25}^*}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]}, \quad G_{26}^* = \frac{(a_{26})^{(4)}G_{25}^*}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

$$T_{24}^* = \frac{(b_{24})^{(4)}T_{25}^*}{[(b'_{24})^{(4)} - (b''_{24})^{(4)}((G_{27})^*)]}, \quad T_{26}^* = \frac{(b_{26})^{(4)}T_{25}^*}{[(b'_{26})^{(4)} - (b''_{26})^{(4)}((G_{27})^*)]}$$

Obviously, these values represent an equilibrium solution of GLOBAL GOVERNING EQUATIONS

Finally we obtain the unique solution of THE HOLISTIC SYSTEM

G_{29}^* given by $\varphi((G_{31})^*) = 0, T_{29}^*$ given by $f(T_{29}^*) = 0$ and

$$G_{28}^* = \frac{(a_{28})^{(5)}G_{29}^*}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]}, \quad G_{30}^* = \frac{(a_{30})^{(5)}G_{29}^*}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

$$T_{28}^* = \frac{(b_{28})^{(5)}T_{29}^*}{[(b'_{28})^{(5)} - (b''_{28})^{(5)}((G_{31})^*)]}, \quad T_{30}^* = \frac{(b_{30})^{(5)}T_{29}^*}{[(b'_{30})^{(5)} - (b''_{30})^{(5)}((G_{31})^*)]}$$

Obviously, these values represent an equilibrium solution of THE HOLISTIC SYSTEM

Finally we obtain the unique solution of SOLUTIONAL EQUATIONS OF THE CONCATENATED EQUATIONS

G_{33}^* given by $\varphi((G_{35})^*) = 0, T_{33}^*$ given by $f(T_{33}^*) = 0$ and

$$G_{32}^* = \frac{(a_{32})^{(6)}G_{33}^*}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]}, \quad G_{34}^* = \frac{(a_{34})^{(6)}G_{33}^*}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

$$T_{32}^* = \frac{(b_{32})^{(6)}T_{33}^*}{[(b'_{32})^{(6)} - (b''_{32})^{(6)}((G_{35})^*)]}, \quad T_{34}^* = \frac{(b_{34})^{(6)}T_{33}^*}{[(b'_{34})^{(6)} - (b''_{34})^{(6)}((G_{35})^*)]}$$

Obviously, these values represent an equilibrium solution of THE GLOBAL SYSTEM

ASYMPTOTIC STABILITY ANALYSIS

Theorem 4: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ belong to $C^1(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + \mathbb{G}_i, T_i = T_i^* + \mathbb{T}_i$$

$$\frac{\partial(a_{14}'')^{(1)}}{\partial T_{14}}(T_{14}^*) = (q_{14})^{(1)}, \frac{\partial(b_i'')^{(1)}}{\partial G_j}(G^*) = s_{ij}$$

Then taking into account equations OF SOLUTIONALEQUATIONS OF THE GLOBAL SYSTEM and neglecting the terms of power 2, we obtain

$$\frac{dG_{13}}{dt} = -((a'_{13})^{(1)} + (p_{13})^{(1)})G_{13} + (a_{13})^{(1)}G_{14} - (q_{13})^{(1)}G_{13}^*T_{14}$$

$$\frac{dG_{14}}{dt} = -((a'_{14})^{(1)} + (p_{14})^{(1)})G_{14} + (a_{14})^{(1)}G_{13} - (q_{14})^{(1)}G_{14}^*T_{14}$$

$$\frac{dG_{15}}{dt} = -((a'_{15})^{(1)} + (p_{15})^{(1)})G_{15} + (a_{15})^{(1)}G_{14} - (q_{15})^{(1)}G_{15}^*T_{14}$$

$$\frac{dT_{13}}{dt} = -((b'_{13})^{(1)} - (r_{13})^{(1)})T_{13} + (b_{13})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(13)(j)})T_{13}^*G_j$$

$$\frac{dT_{14}}{dt} = -((b'_{14})^{(1)} - (r_{14})^{(1)})T_{14} + (b_{14})^{(1)}T_{13} + \sum_{j=13}^{15} (s_{(14)(j)})T_{14}^*G_j$$

$$\frac{dT_{15}}{dt} = -((b'_{15})^{(1)} - (r_{15})^{(1)})T_{15} + (b_{15})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(15)(j)})T_{15}^*G_j$$

If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ Belong to $C^{(2)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable

Denote

Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + G_i, T_i = T_i^* + T_i$$

$$\frac{\partial (a_{29})^{(5)}}{\partial T_{29}} (T_{29}^*) = (q_{29})^{(5)}, \frac{\partial (b''_i)^{(5)}}{\partial G_j} ((G_{31})^*) = s_{ij}$$

$$\frac{dG_{28}}{dt} = -((a'_{28})^{(5)} + (p_{28})^{(5)})G_{28} + (a_{28})^{(5)}G_{29} - (q_{28})^{(5)}G_{28}^*T_{29}$$

$$\frac{dG_{29}}{dt} = -((a'_{29})^{(5)} + (p_{29})^{(5)})G_{29} + (a_{29})^{(5)}G_{28} - (q_{29})^{(5)}G_{29}^*T_{29}$$

$$\frac{dG_{30}}{dt} = -((a'_{30})^{(5)} + (p_{30})^{(5)})G_{30} + (a_{30})^{(5)}G_{29} - (q_{30})^{(5)}G_{30}^*T_{29}$$

$$\frac{dT_{28}}{dt} = -((b'_{28})^{(5)} - (r_{28})^{(5)})T_{28} + (b_{28})^{(5)}T_{29} + \sum_{j=28}^{30} (s_{(28)(j)})T_{28}^*G_j$$

$$\frac{dT_{29}}{dt} = -((b'_{29})^{(5)} - (r_{29})^{(5)})T_{29} + (b_{29})^{(5)}T_{28} + \sum_{j=28}^{30} (s_{(29)(j)})T_{29}^*G_j$$

$$\frac{dT_{30}}{dt} = -((b'_{30})^{(5)} - (r_{30})^{(5)})T_{30} + (b_{30})^{(5)}T_{29} + \sum_{j=28}^{30} (s_{(30)(j)})T_{30}^*G_j$$

If the conditions of the previous theorem are satisfied and if the functions $(a''_i)^{(6)}$ and $(b''_i)^{(6)}$ belong to $C^{(6)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable

Denote

Wireless Sensor Networks for Paddy Field Crop Monitoring Application in Kuttanad

Santhosh Simon¹, K Paulose Jacob²

(Department of Computer Science, Cochin University of Science and Technology, Kerala, India)

Abstract : The evolution of wireless sensor network technology has enabled us to develop advanced systems for real time monitoring. In the present scenario wireless sensor networks are increasingly being used for precision agriculture. The advantages of using wireless sensor networks in agriculture are distributed data collection and monitoring, monitor and control of climate, irrigation and nutrient supply. Hence decreasing the cost of production and increasing the efficiency of production. This paper describes the application of wireless sensor network for crop monitoring in the paddy fields of kuttanad, a region of Kerala, the southern state of India.

Keywords—Crop monitoring, Precision agriculture, Wireless sensor networks, Zigbee.

Kuttanad, the rice bowl of Kerala, is unique among the rice ecologies of the world; the biggest wetlands of the country, located 0.5 – 2.5 metres below mean sea level (msl). Rice is grown by construction of bunds and dewatering the so formed polders mainly during the pucha (rabi) season from Oct. – Nov. to Jan. – Feb. The soils of Kuttanad are low to medium in fertility. Soil is enriched by annual silt deposition during the monsoon floods. The soils are alluvial with silty clay texture and are acid sulphate in nature with excessive iron content. The major problems faced by Kuttanad rice are flood and lack of drainage, intrusion of saline water and soil acidity. In spite of the sharp decline in area under rice; Kuttanad rice bowl (53600 ha.) accounts for 18 per cent of the rice growing area and 25 per cent of total production of the State. The major occupation in Kuttanad is farming. Rice is the important agricultural product, giving Kuttanad the moniker of “The Rice Bowl of Kerala”. Three crops are grown every year now instead of the traditional two per year. Large farming areas near Vembanad Lake were actually reclaimed from the lake.

I. THE KUTTANAD REGION

Rice is the one of the most widely grown crops in the world and is one of the major food crops grown extensively in India. The most important rice producing states of India are West Bengal, Andhra Pradesh, Bihar, Tamil Nadu, Assam and Kerala. In Kerala, Palghat, Trichur and Kuttanad are the main rice producing regions. Kuttanad popularly known as the rice bowl of Kerala, located in central Kerala, is a large wetland habitat comprising of paddy fields, marshes, lakes and rivers. Kuttanad consists of 54 revenue villages spread over 10 taluks in the districts of Alleppey, Kottayam and Pathanamthitta. It is separated from the Arabian sea by a narrow strip of land and is deltaic formation of four river systems, namely Meenachil, Pampa,

Manimala and Achenkovil, together with the lying areas (marshes) in and around the Vembanad lake. Most of the vast expanse in this region is lying 1 – 1.5 m below mean sea level, water-logged throughout the year, subjected to continued flood submergence during monsoon and saline water ingress during the summer month.

The vast area of paddy fields in Kuttanad extends from 9° 17' N to 9° 40' N and 76° 19' E to 76° 33' E. These are divided into “padasekharams” literally meaning groups or blocks of paddy fields and are separated by canals, bunds and water-logged masses. The pucha lands of Kuttanad are classified under three categories based on elevation, geographical formation and soil characteristics, into Karappadoms, Kayal lands and Kari lands. The Karappadoms are generally situated along with the waterways and constitute the lower reached of the eastern and southern periphery of Kuttanad, usually 1-2 m below mean sea level. Vembanad Lake for agricultural purpose and the elevation ranges from 1.5 to 2.5 m below the mean sea level. The Kari lands situated in Ambalappuzha, and Vaikomtaluks is peaty and marshy in nature and are overgrown in many areas with wild weeds and grass and most of the Kari lands lie at or below mean sea level.

‘Puncha’ is the main paddy crop in Kuttanad sown in November or December and harvested by the end of March. The ‘virippu’ is the additional crop grown from May to the end of June and harvested in September or October. High yielding varieties of rice are sown in all the areas of Kuttanad. The gap between demand and local production of rice in Kerala is widening primarily because of the continuous pace at which rice are giving way to urbanization.

II. AUTOMATED WATER LEVEL REGULATION

The soil of the paddy fields of Kuttanad is salty and is extremely acidic. The acidity is due to the production of sulphuric acid by microbiological oxidation of sulphur compound present in the soil. High amount of iron, manganese, aluminum and sulphides are present in the soil. This acidity of the soil is a major constraint which retards the production of rice in the Kuttanad area. Regular rinsing of the soil by water can reduce the acidity and increase the production. Rice is a crop which needs high amount of water

for its growth. The main factor to be considered here is that the water should not be too much or too low. Periodic monitoring and controlling water level is essential for the healthy growth of the rice plant.

Due to the socio-economic states prevailing in the state of Kerala the labor community is getting narrower. The paddy field owners are not able to recruit sufficient labors for these processes. The initial activities like plowing, seeding etc and the final activities like harvesting are done as a group and hence can be easily coordinated. The periodic monitoring of needs, controlling the pests and water level monitoring is a tedious process. Majority of the paddy field farmers are employed in some other activities or are considering this activation as a secondary business. Hence their insolvent on a daily basis should be greatly reduced.

Since the pumping of water to and from the field is the major activity from plowing to harvesting, automating the process can greatly reduce the load on farmers. Automated systems may monitor the water level and regulate the levels by sophisticated systems and can send messages to the farmers.

III. SENSORS FOR MONITORING WATER LEVEL

Paddy field is a large area and is nearly flat in nature. Normally the water level in a field will be uniform throughout the field. Water wells can be made as per the need and the water level in each well can be monitored. Water level sensors can be used for sensing the levels. These sensors can monitor the level according to the user needs. Normally there can be three levels, normal, high and low. These sensors are electro-mechanical devices. Even though electronic sensors are available due to the environmental conditions electro-mechanical devices are more applicable. The mechanical part in the devices will float on water and the electrical part will produce the signals based on the portion of the floating device.

These values or signals generated by the sensor needs to be transmitted to the farmers. Transmitting the electrical signal from the device in the field to the farmer through copper wire is not practical, since it is so long and we many wells and sensors at different locations in the field. A farmer may have hectors of area as paddy field and need hundred of sensors for monitoring. Hence wired devices are not practical. Use of commonly used wireless communication technology is also not advisable due to complexity of the communication system and the high power needs of such systems. Proving power supply or having a solar panel is also not economical. High battery power may be needed by such devices and regular charging or replacement of the batteries is highly costly. Alternative solution is to provide power from a solar panel. The solar panels are of high cost and hence are after prove to theft. The paddy fields are of large area and ensuring security to each solar panel is also not possible. Low cost communication devices which needs low power and less maintenance, which can operate on a wireless architecture is the solution. The new generation wireless sensor networks can be considered for the situation.

IV. WIRELESS SENSOR NETWORKS FOR COMMUNICATION

Wireless sensor Network (WSN) is a major technology used for real time monitoring of environmental assets. WSN has the advantages of large scale deployment, low maintenance, scalability, adaptability, less power needs etc. with the disadvantages of low memory, low power, low bandwidth etc. They can be employed in hostile environments and the features like use of low power and low maintenance makes them the most suited technology for real-time environmental monitoring. They can be highly useful in monitoring the water level in the paddy fields.

ZigBee is the most commonly used network standard today and it is a low-cost, low-power consumption, low data-rate, two-way wireless networking standard that is aimed at remote control and sensor applications which is suitable for operation in harsh radio environments and in isolated locations. It builds on the IEEE standard 802.15.4-2003 which defines the physical layer and medium access control sub layer. Above this, ZigBee defines the application and security layer specifications enabling interoperability between products from different manufacturers. There are several different network topologies that a wireless sensor network can form: star, tree, bus, ring, and mesh. All these topologies have their own individual benefits but the mesh network topology is best suited in our case. A ZigBee WSN is shown in Fig 1. It consists of three types of nodes: a ZigBee Coordinator, ZigBee Routers, and ZigBee End-Devices.

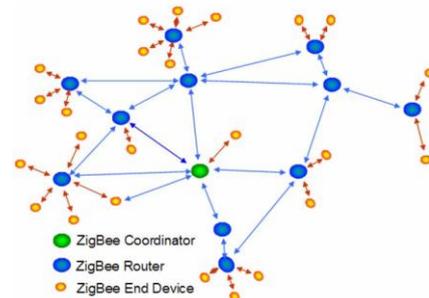

Figure 1-Typical ZigBee WSN – Mesh Architecture

V. WSN SYSTEM ARCHITECTURE

In our project the water wells are constructed at suitable location in the field and sensor columns are attached. The electro-mechanical sensors will measure the water level and the valves can be transmitted through the WSN for this the entire paddy field can be divided into a number of clusters and these clusters can have number of water wells or sensor wells. Each cluster will have a cluster head and all sensor nodes in that cluster will communicate the data to the cluster heads. The water level sensed by the sensor can be low, normal or high. These valves are sent to the cluster head then the cluster head aggregates these valves and compare them. If all the valves are normal then it need not send any data to the user. If any valve is high or low then it needs to be communicated to the user. For this the cluster head transmits the data to the sink node. The sink node is the node which is connected to all the cluster heads or in other words the cluster heads can communicate to the sink node in one hop.

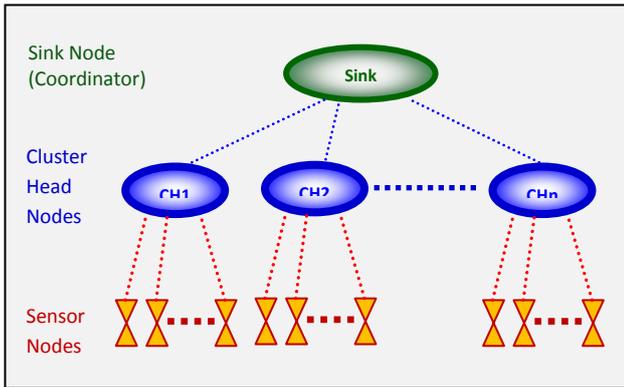

Figure 2 – WSN Architecture

Different topologies can be adopted in the WSN. In our project we are using a mesh topology. The WSN architecture used for the project is shown in fig 2. The sensor nodes in on region will form a mesh structure and each of these mesh structure will be a cluster. These nodes will together have a head node called the cluster head. For example in a wireless sensor network with hundred nodes, the nodes can be divided region wire ten to twelve nodes can form a cluster which operate in a mesh topology. Each of these meshes will have a head node called the cluster head node. Similarly another ten to twelve nodes form another mesh cluster. Totally we may have eight to ten clusters and their cluster heads. Then cluster heads are operating in the mesh topology so we have a mesh with two levels. These cluster heads communicating to the sink node which is on top of the network architecture.

Sudden increase in the water level or decline in the water level is not often occurred hence real-time monitoring or a full time monitor is not necessary. The monitoring can be done on a six hour basis, that is four times a day and its remedial measures can be taken. The remedial measure in the sense, pumping in water if water level is low and pumping out water if water level is high. As stated earlier in the introduction, Kuttanad area is lying below the mean sea level. The water level in the surrounding water bodies of the paddy field are higher than that of the paddy fields so pumping in water is easy by just opening the inlet valves located at the outer boundaries of the paddy fields. At situation where water level is high the excess water needs to be pumped out for this to happen there are electrical pump stations at different locations. The paddy fields are connected each other through water canals and these canals will have the pumping station. These pumps can be operated and the water can be pumped out.

Normally the low level sensor nodes will be in the sleep state and will be active only on the sixth hourly basis. When active they sense the water level and send it to the cluster head. After sensing and transmitting it goes to the sleep state for power usage optimization and will be active in the next sixth hour slot or otherwise instructed by the cluster head.

VI. DATA AGGREGATION

Initially when the network gets booted up each low level sensor node will measure the water level through the electro mechanical sensors and this valve will be sent to the cluster head. The cluster head upon receiving the data

packet from all its subordinate nodes will start analyzing the data. It compares the valves of water level with the predetermined values. These predetermined values are fed to the system by the farmer. These values will be different according to different seasons and processes initiated by the farmer, for example, the field needs to be dry for some days after de-weeding and more water needs to be present for applying fertilizer.

On analysis if the cluster head is finding the value to be higher or lower than the predetermined value, it enters into a state from *normal* to *alert state*. Otherwise it continues to be in the *normal state*. On *alert state* the cluster head sends the data packets to the sink node and the remaining processes will be done by the sink node. It also instructs the subordinate sensor nodes to *sniff state*. The sensor nodes are having two states, *sniff state* and *sleep state*.

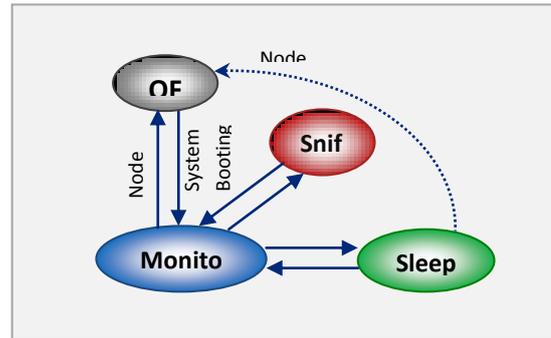

Figure 3 – Sensor Node State Transition

State	Description
OFF	Initial State of the system, Once booted up the node reaches this state when the node is shutdown or fails
Monitor	Normal operation - sensing and transmission at longer intervals
Sniff	Sensing and transmission at shorter intervals
Sleep	No sensing and transmission, a state of low power usage.

During *sniff state*, the sensors will be measuring the water levels at a high rate i.e. at short intervals of time T_{sniff} . It measures the valves and sends these valves to the cluster head. During *sleep state* the sensor nodes will be idle most of the time. Here the sensing intervals will be longer with a larger valve for time, T_{sleep} . The sensor node will initiate a counter for T_{sleep} and goes into *sleep state*, until the counter valve is reached. It wakes up after T_{sleep} and repeats the process by sensing and transmitting data to cluster head.

The state transition from *sleep* to *sniff* and reverse of the sensor nodes is instructed by the cluster head. The cluster head does this after receiving an *alert* value from any of its sensor nodes. Then the cluster head enters into *alert state* and instruct the nodes to enter into *sniff state*. Along with this the data will be reported to the sink node by the cluster head. The sink node will not perform any analysis of the data. It just forwards the matter to the Field Control

Centre (FCC). The Field Control Centre is a program which is running on the user computer. The FCC will receive the data from all the cluster heads through the sink node. The FCC will process these data and decides the remedial actions. It accesses the regions which are affected and then issue commands to the pumping stations of that region to either pump in or pump out the water.

Once the situation of the water level changes it will be reflected on the values received by the cluster heads from the sensor nodes. But it continues to be in the *alert state* until all the sensor nodes are sending values within predefined limit. When this situation is arrived it sends the message to the sink node and instructs all the sensor nodes to go to sleep state and enters into normal state. This state continues for a period of T_{sleep} and the above processes are repeated. Once the situation of the field is under control the full network will be in a sleep state for a period of T_{sleep} .

VII. CONCLUSION AND FUTURE WORK

India is developing at a faster rate but due to urbanization crop fields are getting converted to new forms of the urban world. Also farming community is becoming narrower day by day due to better opportunities. The gap between need and production is increasing at a rapid rate. These problems get elevated when production is decreased. This paper discussed the environmental and socio economical back ground of Kuttanad, the problems faced in agriculture and proposed use of wireless sensor networks for overcoming some difficulties. In the future this proposed system will be fabricated, deployed and tested.

Stiffness Metrics for Design of 3-RRR Flexible Manipulator

K. V. Varalakshmi¹, Dr. J. Srinivas²

Department of Mechanical Engineering, NIT Rourkela-769 008, India

Abstract : This paper presents the kinematics and stiffness analysis of flexible parallel manipulators. As a primary step, the forward kinematic solutions are obtained using soft computing approaches based on Genetic Algorithms (GAs) and Neural networks (NN) and workspace configuration is arrived. The Jacobian and platform stiffness matrices are evaluated within the defined workspace. The flexible link configuration with compliant joints is analyzed using a pseudo rigid-body model. The revolute joint compliance is considered with narrow rectangular flexure hinges which are idealized as equivalent torsional springs in pseudo rigid-body model. Having the defined link dimensions and joint cross-sections at any configuration, the model is discretized with frame and plate elements and the assembled system is analyzed statically and dynamically. The methodology is illustrated with 3-RRR flexible parallel manipulator and the results are compared with commercial software solution.

Keywords: Kinematics, Workspace, Flexible links, Forward kinematics, Pseudo rigid body model.

I. Introduction

Nowadays parallel manipulators have become an attractive topic of interest in several applications, such as machine tools, motion simulators, micro robots, medical devices and physical sensors, due to their intrinsic advantages in the factors of payload, stiffness, accuracy, operational velocity and acceleration. Parallel manipulators which are closed kinematic structures composed of two platforms interconnected by few links. The top platform (referred to as end-effector) is the mobile one controlled with respect to the base platform through variable link lengths to obtain the final position and orientation of the end-effector. The inverse kinematics of such manipulators, which maps the task space to the joint space, is a straight-forward problem; while the direct kinematics is often complex involving multiple solutions in Cartesian space. Direct kinematics is concerned with the determination of the end-effector pose from the given set of link lengths or joint angles. It has no closed form solution since it involves solving a series of simultaneous nonlinear algebraic equations and non-unique multiple set of solutions referred to the assembly modes, are obtained from one set of data.

Several approaches have been proposed for the forward kinematics of such manipulators. The analytical approach formulates a system of nonlinear equations and then converts it to a high degree univariate polynomial which can be solved by numerical techniques. It has been shown that for the most general parallel manipulators, this approach leads to

a polynomial of degree 40, resulting in 40 distinct solutions [1-2]. However, the challenging problem is not to find all the solutions, but to directly determine a unique solution among all possible solutions. Two approaches achieve this requirement, namely the iterative approach and the use of additional sensors [3-5]. These approaches have their own disadvantages in terms of complexity and cost. The Jacobian matrix of the system [6] is also of importance in static analysis and velocity kinematics, which in turn required in trajectory control tasks.

In practice, the functionality of linkage would be drastically affected by treating the closed-loop assembly as a compliant mechanism. Monolithic skeleton joining all the links with narrow cross sectional segments forms such compliant mechanism. There are several advantages of these compliant mechanisms and many studies [7-8] revealed the analysis of such compliant parallel linkages. The workspace characteristics, including total (or reachable) and primary (or dexterous) spaces and the singularity characteristics are also important factors in design as well as control coordination of parallel manipulators. The total workspace is the region over which the end-effector can reach with at least one orientation, whereas the primary workspace is that the end-effector can reach with all orientations [9]. Many researchers have addressed the workspace analysis of parallel manipulators and the predominant approach used as seen in the literature in general, has been a geometric mapping. For example, the boundary of the dexterous workspace for a 3-degree of freedom (DOF) planar parallel manipulator was determined by using screw theory [10] and geometric reasoning [11-12]. For a broader class of parallel manipulators, a study to classify the various shapes of workspace due to changes in link lengths was reported in [13] and a formulation of an architecture-independent method based on kinematic mapping can be found in [14]. The manipulator sometimes loses degrees of freedom at some inverse kinematic singularities within the workspace. It is shown that at these instants stiffness of manipulator reaches a maximum value. Several recent works focused on such studies to improve the effectiveness of the manipulation.

In this line, the present work deals with forward and inverse kinematics, workspace and stiffness analysis of parallel manipulators. The forward kinematics solutions are obtained numerically by minimizing the squared-error defined in terms of Cartesian pose vector and the solutions are validated with radial-basis function neural network outputs. Jacobian matrix at a particular platform pose is then obtained and platform stiffness matrix is determined. For the analysis of the link-flexibility and joint compliance effects, a finite element model is proposed with frame and plate elements

along with equivalent torsional stiffness at the joints. This facilitates in evaluation of changes in platform stiffness matrix of manipulator. The stiffness indices are validated with commercial finite element code. The paper is organized as follows: Section-2 deals with the mathematical modelling of illustrated 3-RRR planar parallel manipulator and various indices to represent the kinematic characteristics along with an introduction to the proposed FE model. Section-3 describes the results and discussion.

II. Mathematical Modelling

The 3-RRR is a three degree-of-freedom planar parallel manipulator. It has a mobile platform and three R-R-R serial chains that join it to a fixed base. Each chain is composed by three rotational revolute (R) joints. As shown in Fig.1, the point P(x,y) is the end-effector position in the global reference frame and ϕ be its orientation. The point O is the origin of the fixed reference frame and the points A_i, B_i, C_i , with $i=1,2,3$, define the rotational articulations of each limb. Points A_i are actuated, so that the actuators are fixed to the base. Thus, the three fixed pivots A_1, A_2 and A_3 define the geometry of a fixed base and the three moving pivots C_1, C_2 and C_3 define the geometry of a moving platform. Together, the mechanism consists of eight links and nine revolute joints. In the programming of a robot manipulator, typically a set of desired positions and orientation, and perhaps the time derivatives of the positions and orientations of the end-effector are specified in space. The problem is to find all possible sets of actuated joint variables and their corresponding time derivatives which will bring the end-effector to the set of desired positions and orientations with the desired motion characteristics. This process is known as inverse kinematics. On the other hand, sometimes the actuated joint variables and possibly their time derivatives are obtained from reading of sensors installed at the joints, from which all possible sets of end-effector positions and orientations and their corresponding time derivatives are obtained. This procedure is called direct or forward kinematics. The closure loop equations are extremely important in order to analyze and solve these kinematics problems of parallel robots, as they implicitly include the constraints of the mechanism. For direct kinematics of a 3-RRR manipulator, Gosselin [15] showed that a maximum of six solutions are possible. However, due to the trajectory tracking procedure, only one of the solutions is deemed to be correct. Kinematics problems can be solved by various methods such as geometric vector analysis, matrix algebra, direct search and screw-theory.

2.1 Inverse Kinematics

Inverse kinematics of 3-RRR is a straight-forward problem, which is an essential step for the velocity kinematics [16-17]. The base coordinate frame $O-X_0-Y_0$ shown in Fig. 1 is fixed at joint A_1 and a moving or mobile coordinate frame $P-X-Y$ is attached at the center of the moving platform. Let a and h denote the width of the base and moving platforms respectively. It is also assumed that the length of each link in the limb as l .

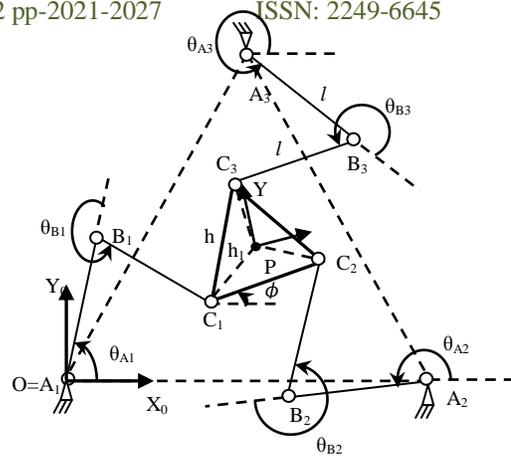

Fig.1 Schematic of 3-RRR Planar Parallel Manipulator

The position vector of point B_i ($i=1,2,3$) in the base coordinate frame can be expressed as

$$r_{Bi} = r_{Ai} + l \begin{bmatrix} \cos \theta_{Ai} \\ \sin \theta_{Ai} \end{bmatrix}, \quad i = 1,2,3. \tag{1}$$

where r_{Ai} and r_{Bi} are the position vectors of joint points A_i and B_i . Also, θ_{Ai} are rotation angles of links A_iB_i . The position vector of C_i can be written as

$$r_{Ci} = r_p + [R]r_{Ci}^p \tag{2}$$

Here again, r_p is the position vector of P with respect to base coordinate frame $O-X_0-Y_0$ and r_{Ci}^p is the position vector of C_i in the mobile frame $P-X-Y$, $[R] = \begin{bmatrix} \cos \phi & -\sin \phi \\ \sin \phi & \cos \phi \end{bmatrix}$ is the rotation matrix for transforming the coordinate system $P-X-Y$ to $O-X_0-Y_0$ and θ_{Bi} is the rotation angle of links B_iC_i . The constraint equation associated with the i^{th} kinematic chain can be expressed as a second-order norm given by:

$$\|r_{Ci} - r_{Bi}\| = l, \quad i=1, 2, 3 \tag{3}$$

These are three equations in-terms of actuation degree of freedom θ_{Ai} for given set of coordinates of P and they correspond to workspace space circles. The above equation (3) can be written as

$$e_{1i} \sin \theta_{Ai} + e_{2i} \cos \theta_{Ai} + e_{3i} = 0 \tag{4}$$

Based on equation above equation, the inverse kinematics solution for 3-RRR mechanism can be expressed as

$$\theta_{Ai} = 2 \tan^{-1} \frac{-e_{3i} \pm \sqrt{e_{1i}^2 + e_{2i}^2 - e_{3i}^2}}{e_{3i} - e_{2i}}, \quad i = 1,2,3. \tag{5}$$

where

$$e_{1i} = -2l \left(y - \frac{h \sin \phi}{2} - \frac{\sqrt{3} h \cos \phi}{6} \right) \tag{6}$$

$$e_{21} = -2l \left(x - \frac{h \cos \phi}{2} + \frac{\sqrt{3} h \sin \phi}{6} \right) \quad (7)$$

$$e_{31} = \left(x - \frac{h \cos \phi}{2} + \frac{\sqrt{3} h \sin \phi}{6} \right)^2 + \left(y - \frac{h \sin \phi}{2} - \frac{\sqrt{3} h \cos \phi}{6} \right)^2 \quad (8)$$

$$e_{12} = -2l \left(y + \frac{h \sin \phi}{2} - \frac{\sqrt{3} h \cos \phi}{6} \right) \quad (9)$$

$$e_{22} = -2l \left(x + \frac{h \cos \phi}{2} + \frac{\sqrt{3} h \sin \phi}{6} - a \right) \quad (10)$$

$$e_{32} = \left(x + \frac{h \cos \phi}{2} + \frac{\sqrt{3} h \sin \phi}{6} - a \right)^2 + \left(y + \frac{h \sin \phi}{2} - \frac{\sqrt{3} h \cos \phi}{6} \right)^2 \quad (11)$$

$$e_{13} = -2l \left(y + \frac{\sqrt{3} h \cos \phi}{3} - \frac{\sqrt{3}}{2} a \right) \quad (12)$$

$$e_{23} = -2l \left(x - \frac{\sqrt{3} h \sin \phi}{3} - \frac{1}{2} a \right) \quad (13)$$

$$e_{33} = \left(x - \frac{\sqrt{3} h \sin \phi}{3} - \frac{1}{2} a \right)^2 + \left(y + \frac{\sqrt{3} h \cos \phi}{3} - \frac{\sqrt{3}}{2} a \right)^2 \quad (14)$$

Taking the time derivative of the Eq. (3) leads to:

$$\begin{bmatrix} D_{11} & 0 & 0 \\ 0 & D_{22} & 0 \\ 0 & 0 & D_{33} \end{bmatrix} \begin{Bmatrix} \dot{\theta}_{A1} \\ \dot{\theta}_{A2} \\ \dot{\theta}_{A3} \end{Bmatrix} = \begin{bmatrix} Q_{11} & Q_{12} & Q_{13} \\ Q_{21} & Q_{22} & Q_{23} \\ Q_{31} & Q_{32} & Q_{33} \end{bmatrix} \begin{Bmatrix} \dot{X} \\ \dot{Y} \\ \dot{\phi} \end{Bmatrix} \quad (15)$$

Where

$$Q_{i1} = 2l \cos \theta_{Ai} + e_{2i}/l \quad (16)$$

$$Q_{i2} = 2l \sin \theta_{Ai} + e_{1i}/l \quad (17)$$

$$D_{ii} = e_{1i} \cos \theta_{Ai} - e_{2i} \sin \theta_{Ai} \quad (18)$$

$$Q_{13} = \left(\frac{h \sin \phi}{2} + \frac{\sqrt{3} h \cos \phi}{6} \right) Q_{11} - \left(\frac{h \cos \phi}{2} - \frac{\sqrt{3} h \sin \phi}{6} \right) Q_{12} \quad (19)$$

$$Q_{23} = \left(\frac{h \cos \phi}{2} + \frac{\sqrt{3} h \sin \phi}{6} \right) Q_{22} + \left(-\frac{h \sin \phi}{2} + \frac{\sqrt{3} h \cos \phi}{6} \right) Q_{21} \quad (20)$$

$$Q_{33} = -\frac{\sqrt{3} h \sin \phi}{3} Q_{32} - \frac{\sqrt{3} h \cos \phi}{3} Q_{31} \quad (21)$$

Equation (15) can be written as: $[J_q]\{\dot{q}\}=[J_x]\{\dot{X}\}$ with $[J_q]$ and $[J_x]$ as two Jacobian matrices; one giving the condition for direct singularity problem and other gives that of the inverse singularity states.

2.2 Forward Kinematics Solutions

The investigation of forward kinematics issue is important and practical for the manipulation and control of the pose of the parallel manipulator. In present paper, two soft computing tools are proposed based on (i) minimization of positional error of platform joints and (ii) integrating a neural network with inverse kinematics model. Referring to Fig.2, if the six input angles and all the link-lengths are specified, the positions of points C_i are calculated from the following equation [18]:

$$C_i = [A_i + l \cos(\theta_{Ai}) + l \cos(\theta_{Ai} + \theta_{Bi}),$$

$$l \sin(\theta_{Ai}) + l \sin(\theta_{Ai} + \theta_{Bi})], \quad i=1, 2, 3 \quad (22)$$

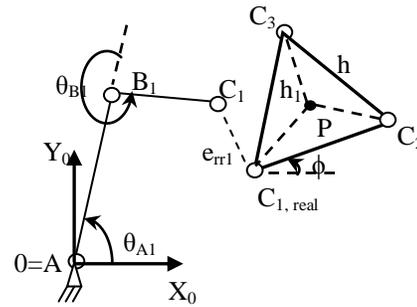

Fig.2 Connectivity of point C_1 in one limb

On the other hand, the real coordinates $C_{i,real}$, are obtained from a set of Cartesian pose vector $(x, y$ and $\phi)$ of the table centre according to the following inverse relations:

$$C_{1,real} = [x - h_1 \cos\left(\frac{\pi}{6} + \phi\right), y - h_1 \sin\left(\frac{\pi}{6} + \phi\right)] \quad (23)$$

$$C_{2,real} = [x + h_1 \cos\left(\frac{\pi}{6} - \phi\right), y - h_1 \sin\left(\frac{\pi}{6} - \phi\right)] \quad (24)$$

$$C_{3,real} = [x - h_1 \sin(\phi), y + h_1 \cos(\phi)] \quad (25)$$

The connectivity error $f = \sum_{i=1}^3 e_{rr_i} = \sum_{i=1}^3 \|C_{i,real} - C_i\|$, between the two sets of points $C_{i,real}$ and C_i constitutes the objective function to be minimized. When this error is close to zero, the manipulator achieves a desired position and orientation of the mobile platform. In present work, binary coded genetic algorithms (GA) approach is used to obtain the optimum solution. GA [19-20] is computational method meant to solve complex and nonlinear optimization problems. They are inspired by the genetic processes of living organisms. In nature, individuals of a population compete for basic resources. Those individuals achieving better surviving rates have higher probabilities to attract possible partners and to generate descendants. As a consequence, best adapted individuals' have higher chances to be passed on to the next generations. GA, in order to emulate this behavior, works with a population of individuals. Each individual represents the possible solution of a problem (for example the best set of features to identify disruptions). The quality of each individual in evolutionary terms is evaluated on the basis of a fitness function. A higher probability to have descendants is assigned to those individuals with better fitness functions. The most promising areas of the searching space are explored by favoring the crossing between the better adapted individuals.

Neural networks are noted for the ability of complex functions learning and relationship building, which led to their extensive applications including pattern classification, function approximation and optimization. They can be utilized to address the forward kinematics problem of parallel manipulators. As the solution of inverse kinematics problem for parallel manipulators is simpler than forward kinematics problem, neural network addresses the forward kinematics model through the use of inverse kinematics solution. Training set for neural network is selected out of the set of

inverse kinematics solutions. Discrete points of each actuated joint are taken as inputs and corresponding poses about the motion of platform center are considered as outputs. The neural network is trained using the above off-line training set and gives the solution of the forward kinematics model. In present work, conventional radial basis function network [21] with a nonlinear hidden layer and a linear output layer is employed. Each of the units in hidden layer applies a fixed-feature detector which uses a specified kernel function (Gaussian) to detect and respond to localized portions of the input vector space. The network output is a weighted linear summation of the output of the hidden neurons. This network is a universal function approximates that demonstrates more robustness and flexibility than traditional regression approaches such as polynomial fits. Fig.3 shows the proposed methodology of solving forward kinematics.

2.3 Workspace of the linkage

An important characteristic of a parallel manipulator is its workspace. Several types of workspaces have been proposed, such as the constant orientation workspace, the maximal workspace, the inclusive maximal workspace, and the dexterous workspace. The constant orientation workspace of a planar parallel mechanism can be found as the intersection of annular regions corresponding to the reachable workspaces of its kinematics chains.

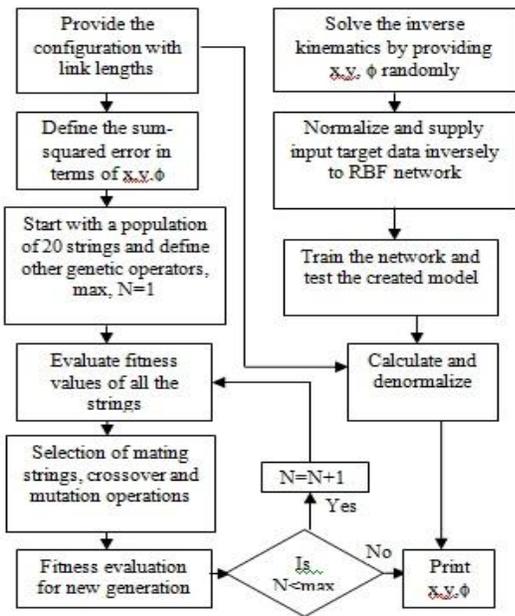

Fig.3 Flowchart for the forward kinematics methodology

The equations of workspace circles can be expressed as [16]:

$$(x+C_{ix}'\cos \phi - C_{iy}'\sin \phi - A_{ix})^2 + (y + C_{ix}'\sin \phi + C_{iy}'\cos \phi - A_{iy})^2 = (l_1 \pm l_2)^2 \quad (26)$$

Here l_1 and l_2 are the lengths of links A_iB_i and B_iC_i respectively. The prime ' indicates that coordinate measurement is with respect to mobile frame of reference. Thus, workspace essentially depends on x,y and ϕ . If $l_1 \neq l_2$,

there are two concentric circles correspond to every center. In practice, the link lengths are taken identical in most of the cases.

2.4 Jacobian analysis

Let the actuated joint variables and the location of the moving platform be denoted by the vectors q and x , respectively. Then the kinematic relations can be written in the general form as $f(x,q)=0$ where f is the function of $x=(x, y, \phi)^T$ and $q=(\theta_{A1}, \theta_{A2}, \theta_{A3})^T$ and 0 is an n -dimensional zero vector. The variables x, y and ϕ are the coordinates of the end-effector point P with respect to the base and orientation of the platform, respectively. Moreover, θ_{A1}, θ_{A2} and θ_{A3} denote actuated joints. Differentiating the f with respect to the time, $[J_x]\{\dot{x}\} + [J_q]\{\dot{q}\}=0$ is obtained. Here \dot{x} and \dot{q} are the time derivatives of x and q , respectively. Here $[J_q]$ and $[J_x]$ are two separate Jacobian matrices. The overall Jacobian matrix for a parallel manipulator can be obtained as $[J] = [J_q]^{-1}[J_x]$ and also corresponding stiffness

2.5 Stiffness Analysis & Dexterity index

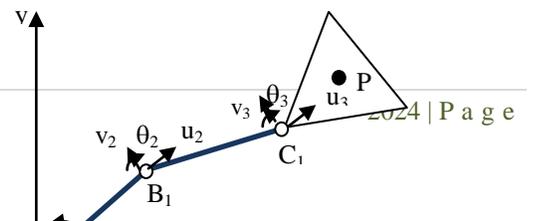

The value of stiffness evolves according to the geometry, topology of the structure and position and orientation of the platform within the workspace. The stiffness of a parallel robot at a given point of its workspace can be characterized by its stiffness matrix. This matrix combines the forces and moments applied to the platform. For rigid body model, the stiffness matrix is defined as follows [22]:

$$[S]=k[J]^T[J]^{-1}=k([J][J]^T)^{-1} \quad (27)$$

where k is the stiffness of actuated joint which is assumed to be same for all the joints. The condition number is quite often used as an index to describe the accuracy/dexterity of a robot and the closeness of a pose to a singularity. Condition number of a matrix is used in numerical analysis to estimate the error generated in the solution of a linear system of equations by the error on the data. When applied to the Jacobian matrix, the condition number will give a measure of the accuracy of the Cartesian velocity of the end-effector and the static load acting on the end-effector. The dexterity of a manipulator can be denoted as the condition number of its Jacobian matrix. Dexterity has recently emerged has a measure for manipulator kinematic performance.

2.6 Finite element model

Links are considered as flexible members undergoing flexural and axial deformations. For analysis of flexibility effects, each limb ($i=1,2,3$) of the manipulator is discretized with frame elements and therefore the stiffness matrix for each of the three limbs is calculated as an assemblage of individual link stiffness matrices. In present case, there are three degrees of freedom at each node namely axial deformation (u) and bending deflection (v) and slope (θ) as shown in Fig.4.

(mm)	0	0	0	900	450	779
Mobile joints (mm)	C ₁		C ₂		C ₃	
	x	y	x	y	x	y
	414	230	493	244	441	305

Fig.4 Finite element model

The unknown displacements at the joints are calculated from the applied joint torques and the elemental forces and corresponding stresses are obtained. Joint compliance is considered as a torsional spring in our pseudo-rigid body model. Here the joint is approximated as a narrow rectangular cross-sectioned element, whose spring constant is given as [23] $(E_n I_n)/l_n$, where E_n is the elastic modulus, I_n is the moment of inertia of narrow cross-section which is equal to $\frac{1}{12}bt^3$, for rectangle. Here, b, t, l_n are respectively width, thickness and length of the section.

III. Results and Discussion

The parameters of the manipulator considered in the present analysis are depicted in Table-1. The material chosen is steel with density $\rho=7800\text{kg/m}^3$ and elastic modulus $E=2.1 \times 10^5 \text{N/mm}^2$. This data is needed during the finite element modelling.

Table-1. Dimensional Parameters of Manipulator[24]:

Parameter	Dimension (mm)
Length of each link	400
Thickness of each link	6
Width of each link	23
Side length of the moving platform	80
Side length of the fixed platform	900
Thickness of the moving & fixed platform	25
Length of the narrow cross-section	40
Thickness of the narrow cross-section	1.5
Width of the narrow cross-section	23

Table-2 shows the input configuration of the manipulator in terms of the base and mobile platform coordinates.

Table-2. The 3-RRR planar parallel manipulator configuration

Base Joints	A ₁		A ₂		A ₃	
	x	y	x	y	x	y

First, the genetic algorithm with uniform crossover and mutation used in finding forward kinematic solution has a crossover rate of 0.999 and mutation rate of 0.001. The high crossover rate ensures that maximum global search. The population size is taken as 40, and the outputs are tested by varying the number of generations. The variable ranges considered in the present task are shown in Table-3.

Table-3. The upper and lower bounds of the design variables.

Design variables	Variable limits
Cartesian coordinate moving platform (x)	[0 – 600 mm]
Cartesian coordinate moving platform (y)	[0 – 600 mm]
Angle of the moving platform (ϕ)	[-360° - 360°]

During neural network analysis, initially an inverse kinematics problem is solved by geometric method for a range of Cartesian coordinates of the end-effector X, Y and ϕ chosen according to $X=[445,450 \text{ mm}]$, $Y=[255,262 \text{ mm}]$ and $\phi=[-10^\circ \ 10^\circ]$. Now RBF neural network model is trained with the output of the above inverse kinematics solution as input data, while the corresponding Cartesian coordinates are treated as target data. The number of training patterns taken here are 1008 and the spread constant employed is 1.0. Table-4 shows the comparison forward kinematic solution with genetic algorithms and neural networks.

Table-4. Forward kinematic solution using Genetic Algorithms and Neural networks

Method	No. of Iterations	X (mm)	Y (mm)	ϕ (deg)
GA	5000	449.85	260.41	9.50
	6000	451.61	259.82	9.50
Neural networks	1008	448.94	257.64	10.18
	1008	451.81	259.34	9.78

It is observed that the results obtained from genetic algorithms and neural networks are very close to each other. Fig.5 shows the fitness variation with number of iterations in genetic algorithms.

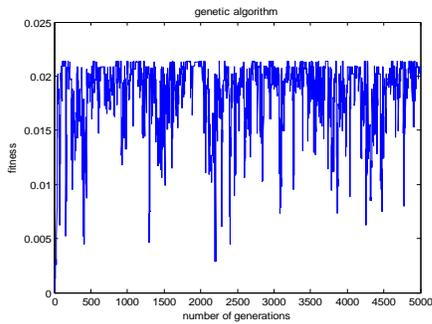

Fig.5 Fitness Vs number of generations
The performance curve for neural network is shown in Fig.6.

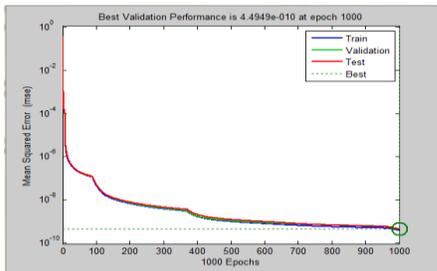

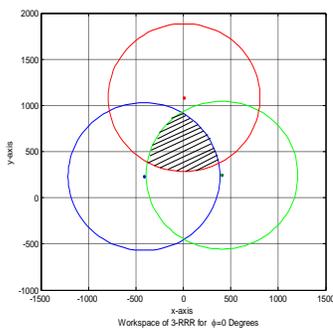

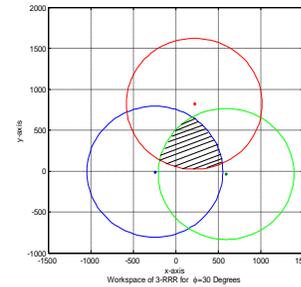

Fig.6 Graph of Training Performance in neural network

The constant orientated workspace is plotted for different angles of the moving platform as shown in Fig.7 and it is observed that the area of the workspace decreases when ϕ varies from 0° to 30° . The dexterity of a mechanism can be considered as its ability to perform small displacements of its end effector at a specified pose of its workspace. It is based on the condition number of the homogeneous Jacobian matrix here the inverse condition number is mapped on a constant orientation workspace to determine the dexterity of the manipulator as shown in Fig.8. It is well known that as inverse condition number is equal to 1 represents a perfect isotropic dexterity and 0 represents singular configuration. Here in Fig.8 all the values around the boundary of the workspace are close to zero, indicating the singularity regions. In order to verify and examine the static performance, a finite element model is prepared. The analysis is carried out using the ANSYS (V13) software.

(a) $\phi=0^\circ$

(b) $\phi=30^\circ$

Fig.7 Constant orientation work spaces at X=450mm, and Y=259.81mm

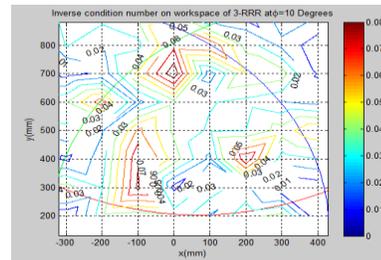

Fig.8 Inverse condition number mapping on constant orientation workspace

The distributions for the scaled minimum stiffness are illustrated in Fig.9. It can be observed that, the distribution of stiffness in a x-y plane the lowest value of minimum stiffness occurs around the boundary of the workspace, where the manipulator approaches direct singularities.

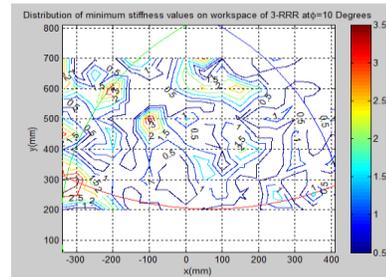

Fig.9 Distribution of minimum stiffness on constant orientation workspace

The finite element model is built based on the original geometrical prototype dimensions, as shown in Fig.10,

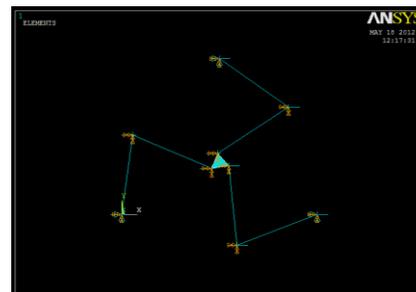

Fig.10 ANSYS image of the model

2-D BEAM188 elements with realistic parameters for limbs and four-node SHELL181 element for moving platform and at each joint combination 14 (spring constant) are

adopted to mesh the model. Forces are applied on the actuated joints so as to get a deformation on the moving platform. The displacements of the model at each node are carefully examined. The analysis results are close to the theoretical outputs as shown in Table-5.

Table-5. Displacement of the end-effector at each node

S.No	Displacements at the end-effector (mm)	
	Theoretical	ANSYS
1	0.0010	0.0022
2	0.0014	0.0023
3	0.0000	0.0021

And also the stiffness at one platform pose (i.e., $x=450\text{mm}$, $y=259.81\text{mm}$, $\phi=10^\circ$) of the moving platform is presented. Here, it is observed that the trace of the Jacobian matrix of the rigid body model as -0.123 . The manipulator stiffness is estimated from the nodal displacements and corresponding reaction forces in the finite element model. Using ANSYS software, it is found to be $0.1007 \times 10^9 \text{ N/mm}$, which is quite larger than $0.816 \times 10^5 \text{ N/mm}$ as obtained from conventional rigid body model with Jacobian matrix. The discrepancy of stiffness may be due to mismatch of the degrees of freedom in the elements under consideration for meshing.

IV. Conclusions

This paper has presented forward kinematic solutions for rigid body model using genetic algorithms and neural networks and also a constant orientation workspace is calculated. Within this workspace, Jacobian and stiffness analysis are conducted and to know the performance of the manipulator the inverse condition number and minimum stiffness values are plotted. Finally at one particular platform pose, finite element model is developed in ANSYS and displacements of the end-effector and stiffness index values are estimated.

Turing Machine Operation-A Checks and Balances Model

¹Dr. K. N. Prasanna Kumar, ²Prof. B. S. Kiranagi, ³ Prof C S Bagewadi

ABSTRACT: A state register that stores the state of the Turing machine, one of finitely many. There is one special start state with which the state register is initialized. These states, writes Turing, replace the "state of mind" a person performing computations would ordinarily be in. It is like bank ledger, which has Debits and Credits. Note that in double entry computation, both debits and credits are entered in to the systems, namely the Bank Ledger and balance is posted. Individual Debits are equivalent to individual credits. On a generalizational and globalist scale, a "General Ledger" is written which records in all its wide ranging manifestation the Debits and Credits. This is also conservative. In other words Assets is equivalent to Liabilities. True, Profit is distributed among overheads and charges, and there shall be another account in the General ledger that is the account of Profit. This account is credited with the amount earned as commission, exchange, or discount of bills. Now when we write the "General Ledger" of Turing machine, the *Prima Donna* and *terra firma* of the model, we are writing the General Theory of all the variables that are incorporated in the model. So for every variable, we have an anti variable. This is the dissipation factor. Conservation laws do hold well in computers. They do not break the conservation laws. Thus energy is not dissipated in to the atmosphere when computation is being performed. To repeat we are suggesting a General Theory Of working of a simple Computer and in further papers, we want to extend this theory to both nanotechnology and Quantum Computation. Turing's work is the proponent, precursor, primogeniture, progenitor and promethaleon for the development of Quantum Computers. Computers follow conservation laws. This work is one which formed the primordial concept of diurnal dynamics and hypostasized dynamism of Quantum computers which is the locus of essence, sense and expression of the present day to day musings and mundane drooling. Verily Turing and Churchill stand out like connoisseurs, rancouteurs, and cognescenti of eminent persons, who strode like colossus the screen of collective consciousness of people. We dedicate this paper on the eve of one hundred years of Turing innovation. Model is based on Hill and Peterson diagram.

INTRODUCTION

Turing machine –A beckoning begorra (Extensive excerpts from Wikipedia AND PAGES OF Turing, Churchill, and other noted personalities-Emphasis is mine)

A Turing machine is a device that manipulates symbols on a strip of tape according to a table of rules. Despite its simplicity, a Turing machine can be adapted to simulate the logic of any computer algorithm, and is particularly useful in explaining the functions of a CPU inside a computer.

The "Turing" machine was described by Alan Turing in 1936 who called it an "a (automatic)-machine". The Turing machine is not intended as a practical computing technology, but rather as a hypothetical device representing a computing machine. Turing machines help computer scientists understand the limits of mechanical computation.

Turing gave a succinct and candid definition of the experiment in his 1948 essay, "Intelligent Machinery". Referring to his 1936 publication, Turing wrote that the Turing machine, here called a Logical Computing Machine, consisted of:

...an infinite memory capacity obtained in the form of an infinite tape marked out into squares, on each of which a symbol could be printed. At any moment there is one symbol in the machine; it is called the scanned symbol. The machine can alter the scanned symbol and its behavior is in part determined by that symbol, but the symbols on the tape elsewhere do not affect the behaviour of the machine. However, the tape can be moved back and forth through the machine, this being one of the elementary operations of the machine. Any symbol on the tape may therefore eventually have an innings. (Turing 1948, p. 61)

A Turing machine that is able to simulate any other Turing machine is called a universal Turing machine (UTM, or simply a universal machine). A more mathematically oriented definition with a similar "universal" nature was introduced by Alonzo Church, whose work on calculus intertwined with Turing's in a formal theory of computation known as the Church–Turing thesis. The thesis states that Turing machines indeed capture the informal notion of effective method in logic and mathematics, and provide a precise definition of an algorithm or 'mechanical procedure'.

In computability theory, the Church–Turing thesis (also known as the Church–Turing conjecture, Church's thesis, Church's conjecture, and Turing's thesis) is a combined hypothesis ("thesis") about the nature of functions whose values are effectively calculable; or, in more modern terms, functions whose values are algorithmically computable. In simple terms, the Church–Turing thesis states that "everything algorithmically computable is computable by a Turing machine."

American mathematician Alonzo Church created a method for defining functions called the λ -calculus,

Church, along with mathematician Stephen Kleene and logician J.B. Rosser created a formal definition of a class of functions whose values could be calculated by recursion.

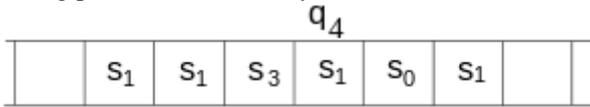

All three computational processes (recursion, the λ -calculus, and the Turing machine) were shown to be equivalent—all three approaches define the same class of functions this has led mathematicians and computer scientists to believe that the concept of computability is accurately characterized by these three equivalent processes. Informally the Church–Turing thesis states that if some method (algorithm) exists to carry out a calculation, then the same calculation can also be carried out by a Turing machine (as well as by a recursively definable function, and by a λ -function).

The Church–Turing thesis is a statement that characterizes the nature of computation and cannot be formally proven. Even though the three processes mentioned above proved to be equivalent, the fundamental premise behind the thesis—the

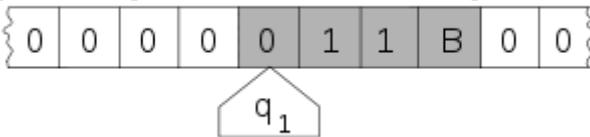

notion of what it means for a function to be "effectively calculable" (computable)—is "a somewhat vague intuitive one" Thus, the "thesis" remains a hypothesis.

Desultory Bureaucratic burdock or a Driving dromedary?

The Turing machine mathematically models a machine that **mechanically operates on** a tape. On this tape are symbols which the machine can read and write, one at a time, using a tape head. Operation is **fully determined** by a finite set of elementary instructions such as "in state q_2 , if the symbol seen is 0, write a 1; if the symbol seen is 1, change into state q_1 ; in state q_1 , if the symbol seen is 0, write a 1 and change to state q_0 ;" etc. In the original article, Turing imagines not a mechanism, but a person whom he calls the "computer", who **executes these** deterministic mechanical rules slavishly (or as Turing puts it, "in a desultory manner").

The head is always over a particular square of the tape; only a finite stretch of squares is shown. The instruction to be performed (q_4) is shown over the scanned square. (Drawing after Kleene (1952) p.375.)

Here, the internal state (q_1) is shown inside the head, and the illustration describes the tape as being infinite and pre-filled with "0", the symbol serving as blank. The system's full state (its configuration) **consists** of the internal state, the contents of the shaded squares including the blank scanned by the head ("11B"), and the position of the head. (Drawing after Minsky (1967) p. 121).

Sequestration dispensation:

A tape which **is divided** into cells, one next to the other. Each cell **contains a** symbol from some finite alphabet. The alphabet **contains a** special blank symbol (here written as 'B') and one or more other symbols. The tape is assumed to be arbitrarily **extendable** to the left and to the right, i.e., the Turing machine is always **supplied with** as much tape as it needs for its computation. Cells that have not been written to before are assumed to be filled with the blank symbol. In some models the tape has a left end marked with a **special symbol; the tape extends or is indefinitely extensible to the right.** A head that can read and write symbols on the tape and move the tape left and right one (and only one) cell at a time. In some models the head **moves and the tape is stationary.**

A state register **that stores** the state of the Turing machine, one of finitely many. There is one special start state with which the state register is initialized. These states, writes Turing, **replace the** "state of mind" a person performing computations would ordinarily be in. It is like bank ledger, which has Debits and Credits. Note that in double entry computation, both debits and credits are entered in to the systems, namely the Bank Ledger and balance is posted. Individual Debits are equivalent to individual Credits. On a generalizational and globalist scale, a "General Ledger" is written which records in all its wide ranging manifestation the Debits and Credits. This is also conservative. In other words Assets is equivalent to Liabilities. True, Profit is distributed among overheads and charges, and there shall be another account in the General ledger that is the account of Profit. This account is credited with the amount earned as commission, exchange, or discount of bills. Now when we write the "General Ledger" of Turing machine, the Primma Donna and terra firma of the model, we are writing the General Theory of all the variables that are incorporated in the model. So for every variable, we have an anti variable. This is the dissipation factor. Conservation laws do hold well in computers. They do not break the conservation laws. Thus energy is not dissipated in to the atmosphere when computation is being performed. To repeat we are suggesting a General Theory Of working of a simple Computer and in further papers, we want to extend this theory to both nanotechnology and Quantum Computation.

A finite table (occasionally called **an action table or transition function**) of instructions (usually quintuples [5-tuples]: $q_i a_j \rightarrow q_l a_k d_k$, but sometimes 4-tuples) that, given the state (q_i) the machine is currently in and the symbol (a_j) it is reading on the tape (symbol currently under the head) tells the machine to do the following in sequence (for the 5-tuple models):

Either **erase or write** a symbol (replacing a_j with a_k), and then

Move the head (which is described by d_k and can have values: 'L' for one step left or 'R' for one step right or 'N' for staying in the same place), and then

Assume the same or a new state as prescribed (go to state q_l).

In the 4-tuple models, erasing or writing a symbol (a_k) and moving the head left or right (d_k) are specified as separate instructions. Specifically, the table tells the machine to (ia) erase or write a symbol or (ib) move the head **left or right**, and then (ii) assume the **same or a new state** as prescribed, **but not both actions** (ia) and (ib) in the same instruction. In some models, if there is no entry in the table for the current combination of symbol and state then the machine will halt; other models require all entries to be filled.

Note that every part of the machine—its state and symbol-collections—and its actions—printing, erasing and tape motion—is finite, discrete and distinguishable; **Only a virus can act as a predator to it.** It is the potentially unlimited amount of tape **that gives it an** unbounded amount of storage space.

Quantum mechanical Hamiltonian models of Turing machines are constructed here on a finite lattice of spin- $\frac{1}{2}$ systems. The **models do not** dissipate any energy and they operate at the quantum limit in that the system (energy uncertainty) / (computation speed) is close to the limit given by the time-energy uncertainty principle.

Regarding finite state machines as Markov chains **facilitates the** application of probabilistic methods to very large logic synthesis and formal verification problems. Variational concepts and exegetic evanescence of the subject matter is done by Hachtel, G.D. Macii, E. ; Pardo, A. ; Somenzi, F. with symbolic algorithms to compute the steady-state probabilities for very large finite state machines (up to 1027 states). These algorithms, **based on** Algebraic Decision Diagrams (ADD's) **-an extension of** BDD's **that allows** arbitrary values **to be associated** with the terminal nodes of the diagrams **-determine the** steady-state probabilities by regarding finite state machines as homogeneous, discrete-parameter Markov chains with finite state spaces, and by solving the corresponding Chapman-Kolmogorov equations. Finite state machines with state graphs **composed of a** single terminal strongly connected component systems authors **have used** two solution techniques: One is based on the Gauss-Jacobi iteration, the other one is based on simple matrix multiplication. Extension of the treatment is done to the most general case of systems which can be modeled as finite state machines with arbitrary **transition** structures; until a certain temporal point, having no relevant options **and effects for** the decision maker beyond that point. Structural morphology and easy decomposition is resorted to towards the consummation of results. Conservation Laws powerhouse performance and no breakage is done with heterogeneous synthesis of conditionalities. Accumulation. Formulation and experimentation are by word and watch word.

Logistics of misnomerliness and anathema:

In any scientific discipline there are many reasons **to use** terms that have precise definitions. Understanding the terminology of a discipline is **essential to** learning a subject and precise **terminology enables us to** communicate ideas clearly with other people. In computer science the problem is even more acute: we **need to construct** software and hardware components that must smoothly **interoperate** across interfaces with clients and other components in distributed systems. The definitions of these interfaces need to be precisely specified for interoperability and good systems performance.

Using the term "computation" without qualification often **generates a** lot of confusion. Part of the problem is that the nature of systems **exhibiting** computational behavior is varied and the term computation means different things to different people depending on the kinds of computational systems they are studying and the kinds of problems they are investigating. Since computation refers to a process that **is defined** in terms of some underlying model of computation, we would achieve clearer communication if we made clear what the underlying model is.

Rather than talking about a vague notion of "computation," suggestion is to use the term in conjunction with a well-defined model of computation whose semantics is clear and which matches the problem being investigated. Computer science already has a number of useful clearly defined models of computation whose behaviors and capabilities are well understood. We should use such models as part of any definition of the term computation. However, for new domains of investigation where there are no appropriate models it may be necessary to invent new formalisms to represent the systems under study.

Courage of conviction and will for vindication:

We consider computational thinking to be the thought processes involved in formulating problems so their solutions can be represented as computational steps and algorithms. An important part of this process is finding appropriate models of computation with which to formulate the problem and derive its solutions. A familiar example would be the use of finite automata to solve string pattern matching problems. A less familiar example might be the quantum circuits and order finding formulation that Peter Schor used to devise an integer-factoring algorithm that runs in polynomial time on a quantum computer. Associated with the basic models of computation in computer science is a wealth of well-known algorithm-design and problem-solving techniques that can be used to solve common problems arising in computing.

However, as the computer systems we wish to build become more complex and as we apply computer science abstractions to new problem domains, we discover that we do not always have the appropriate models to devise solutions. In these cases, computational thinking becomes a research activity that includes inventing appropriate new models of computation.

Corrado Priami and his colleagues at the Centre for Computational and Systems Biology in Trento, Italy have been using process calculi as a model of computation to create programming languages to simulate biological processes. Priami states "the basic feature of computational thinking is abstraction of reality in such a way that the neglected details in the model make it executable by a machine." [Priami, 2007]

As we shall see, finding or devising appropriate models of computation to formulate problems is a central and often nontrivial part of computational thinking.

Hero or Zero?

In the last half century, what we think of as a computational system has expanded dramatically. In the earliest days of computing, a computer was an isolated machine with limited memory to which programs were submitted one at a time to be compiled and run. Today, in the Internet era, we have networks consisting of millions **of interconnected** computers and as we move into cloud computing, many foresee a global computing environment with billions of clients having universal on-demand access to computing services and **data hosted** in gigantic data centers located around the planet. Anything from a PC or a phone or a TV or a sensor can be a client and a data center may consist of hundreds of thousands of servers.

Needless to say, the models for studying such a universally accessible, complex, highly concurrent distributed system are very different from the ones for a single isolated computer. In fact, our aim is to build the model for infinite number of interconnectedness of computers.

Another force at play is that **because of** heat dissipation considerations the architecture of computers **is changing**. An ordinary PC today has many different computing elements such as multicore chips and graphics processing units, and an exascale supercomputer by the end of this decade is expected to be a giant parallel machine with up to a million nodes each with possibly a thousand processors. Our understanding of how to write efficient programs for these machines **is limited**. Good models of parallel computation and parallel algorithm design techniques are a vital open research area for effective parallel computing.

In addition, there is increasing interest in applying computation to studying virtually all areas of human endeavor. One fascinating example **is simulating the** highly parallel biological processes found in human cells and organs for the purposes of understanding disease and drug design. Good computational models for biological processes are still in their infancy. And it is not clear we will ever be able to find a computational model for the human brain that would account for emergent phenomena such **as consciousness or intelligence**.

Queen or show piece:

The theory of computation has been and still is one of the core areas of computer science. It explores the fundamental capabilities and limitations of models of computation. A model of computation is a mathematical **abstraction of a** computing system. The most important model of sequential computation studied in computer science is the Turing machine, first proposed by Alan Turing in 1936.

We can think of a Turing machine as a **finite-state control** attached to a tape head that can read and write symbols on the squares of a semi-infinite tape. Initially, a finite string of length n representing the input is in the leftmost n squares of the tape. An infinite sequence of blanks follows the input string. The tape head is reading the symbol in the leftmost square and the finite control is in a predefined initial state.

The Turing machine then makes a sequence of moves. In a move it reads the symbol on the tape under the tape head and **consults a** transition table in the finite-state control which specifies a symbol to be overprinted on the square under the tape head, a direction the tape head is to move (one square to the left or right), and a state **to enter** next. If the Turing machine **enters an** accepting halting state (one with no next move), the string of nonblank symbols remaining on the input tape at that point in time is its output.

Mathematically, a Turing machine **consists of seven components**: a finite set of states; a finite input alphabet (not containing the blank); a finite tape alphabet (which includes the input alphabet and the blank); a transition function that maps a state and a tape symbol into a state, tape symbol, and direction (left or right); a start state; **an accept state** from which there are no further moves; and a **reject state** from which there are no further moves.

We can characterize the **configuration of** a Turing machine at a given moment in time by three quantities:

1. the state of the finite-state control,
2. the string of nonblank symbols on the tape, and
3. the location of the input head on the tape.

A computation of a Turing machine **on an input w** is a sequence of configurations the machine can go through starting from the initial configuration with w on the tape and terminating (if the computation terminates) in a halting configuration. We say a function f from strings to strings is computable if there is some Turing machine M that given any input string w **always halts in** the accepting state with just $f(w)$ on its tape. We say that M computes f .

The Turing machine provides a precise **definition for** the term algorithm: an algorithm for a function f is just a Turing machine that computes f .

There are scores of models of computation that are equivalent to Turing machines in the sense that these models compute exactly the same set of functions that Turing machines can compute. Among these Turing-complete models of computation are **multitape Turing machines, lambda-calculus, random access machines, production systems, cellular automata, and all general-purpose programming languages**.

The reason there are so many different models of computation equivalent to Turing machines is that we rarely want to implement an algorithm as a Turing machine program; we would like to use a computational notation such as a programming language that is easy to write and easy to understand. But no matter what notation we choose, the famous **Church-Turing thesis** hypothesizes that **any function that can be computed can be computed by a Turing machine**.

Note that if there is one algorithm to compute a function f , then there is an infinite number. Much of computer science is devoted to finding efficient algorithms to compute a given function.

For clarity, we should point out that we have defined a computation as a sequence of configurations a Turing machine can go through on a given input. This sequence could be infinite if the machine does not halt or one of a number of possible sequences in case the machine is nondeterministic.

The reason we went through this explanation is to point out how much detail is involved in precisely defining the term computation for the Turing machine, one of the simplest models of computation. It is not surprising, then, as we move to more complex models, the amount of effort needed to precisely formulate computation in terms of those models grows substantially.

Sublime synthesis not dismal anchorage:

Many real-world computational systems compute more than just a single function—the world has moved to **interactive computing** [Goldin, Smolka, Wegner, 2006]. The term reactive system **is used to** describe a system that maintains an ongoing interaction with its environment. Examples of reactive systems include **operating systems and embedded systems**.

A distributed system is one that consists of autonomous computing systems that communicate with one another through some kind **of network using** message passing. Examples of distributed systems **include** telecommunications systems, the Internet, air-traffic control systems, and parallel computers. **Many distributed systems are also reactive systems**.

Perhaps the most intriguing examples of **reactive** distributed computing systems are biological systems such as cells and organisms. We could even consider the human brain to be **a biological computing** system. Formulation of appropriate models of computation for understanding biological processes is a formidable scientific challenge in the intersection of biology and computer science.

Distributed systems can **exhibit** behaviors such as deadlock, live lock, race conditions, and the like that cannot be usefully studied **using a** sequential model of computation. Moreover, solving problems such as determining the throughput, latency, and performance of a distributed system cannot be productively formulated with a single-thread model of computation. For these reasons, computer scientists **have developed a number** of models of concurrent computation which can **be used** to study these phenomena and to architect tools and components for building distributed systems. Many authors have studied these aspects in wider detail (See for example Alfred V. Aho),

There are many theoretical models for concurrent computation. One is **the message-passing Actor model**, consisting of computational entities called actors [Hewitt, Bishop, Steiger, 1973].

An actor can send and receive messages, make local decisions, create more actors, and fix the behavior to be used for the next message it receives. These actions may be executed in parallel and in no fixed order. The Actor model was devised to study the behavioral properties of parallel computing machines consisting of large numbers of independent processors **communicating by** passing messages through a network. Other well-studied models of concurrent computation include **Petri nets and the process calculi such as pi-calculus and mu-calculus**.

Many variants of computational models for distributed systems are being devised to study and understand the behaviors of biological systems. For example, Dematte, Priami, and Romanel [2008] describe a language called BlenX that is based on a process calculus called Beta-binders for modeling and simulating biological systems.

We do not have the space to describe these concurrent models in any detail. However, it is still an open research area to find practically useful concurrent models of computation that combine control and data for many areas of distributed computing.

Comprehensive envelope of expression not an identarian instance of semantic jugglery:

In addition to aiding education and understanding, there are many practical benefits to having appropriate models of computation for the systems we are trying to build. In cloud computing, for example, there are still a host of poorly understood concerns for systems of this scale. We need to better understand the architectural tradeoffs needed to achieve the desired levels of reliability, performance, scalability and adaptivity in the services these systems are expected to provide. We do not have appropriate abstractions to describe these properties in such a way that they can be automatically mapped from a model of computation into an implementation (or the other way around).

In cloud computing, there are a host of research challenges for system developers and tool builders. As examples, we need programming languages, compilers, verification tools, defect detection tools, and service management tools that can scale to the huge number of clients and servers involved in the networks and data centers of the future. Cloud computing is one important area that can benefit from innovative computational thinking.

The Finale:

Mathematical abstractions called models of computation are at the heart of computation and computational thinking. Computation is a process that is defined in terms of an underlying model of computation and computational thinking is the thought processes involved in formulating problems so their solutions can be represented as computational steps and algorithms. Useful models of computation for solving problems arising in sequential computation can range from simple finite-state machines to Turing-complete models such as random access machines. Useful models of concurrent computation for solving problems arising in the design and analysis of complex distributed systems are still a subject of current research.

The P versus NP problem is to determine whether every language accepted by some nondeterministic algorithm in polynomial time is also accepted by some (deterministic) algorithm in polynomial time. To define the problem precisely it is necessary to give a formal model of a computer. The standard computer model in computability theory is the Turing machine, introduced by Alan Turing in 1936 [Tur36]. Although the model was introduced before physical computers were built, it nevertheless continues to be accepted as the proper computer model for the purpose of defining the notion of computable function.

Examples of Turing machines

3-state busy beaver

Formal definition

Hopcroft and Ullman (1979, p. 148) formally define a (one-tape) Turing machine as a 7-

tuple $M = \langle Q, \Gamma, b, \Sigma, \delta, q_0, F \rangle$ where

Q Is a finite, non-empty set of states

Γ Is a finite, non-empty set of the tape alphabet/symbols

$b \in \Gamma$ is the blank symbol (the only symbol allowed to occur on the tape infinitely often at any step during the computation)

$\Sigma \subseteq \Gamma \setminus \{b\}$ is the set of input symbols

$q_0 \in Q$ is the initial state

$F \subseteq Q$ is the set of final or accepting states.

$\delta : Q \setminus F \times \Gamma \rightarrow Q \times \Gamma \times \{L, R\}$ is a partial function called the transition function, where L is left shift, R is right shift. (A relatively uncommon variant allows "no shift", say N, as a third element of the latter set.)

Anything that operates according to these specifications is a Turing machine.

The 7-tuple for the 3-state busy beaver looks like this (see more about this busy beaver at Turing machine examples):

$Q = \{A, B, C, \text{HALT}\}$

$\Gamma = \{0, 1\}$

$b = 0$ ("Blank")

$\Sigma = \{1\}$

$q_0 = A$ (the initial state)

$F = \{\text{HALT}\}$

$\delta =$ see state-table below

Initially all tape cells are marked with 0.

State table for 3 state, 2 symbol busy beaver

Tape symbol-Current state A-Current state B-Current state C

-Write symbol-Move tape-Next state-Write symbol-Move tape-Next state-Write symbol-Move tape-Next state

0-1-R-B-1-L-A-1-L-B

1-1-L-C-1-R-B-1-R-HALT

In the words of van Emde Boas (1990), p. 6: "The set-theoretical object his formal seven-tuple description similar to the above] provides only partial information on how the machine will behave and what its computations will look like."

For instance,

There will need to be some decision on what the symbols actually look like, and a failproof way of reading and writing symbols indefinitely.

The shift left and shift right operations may shift the tape head across the tape, but when **actually building a** Turing machine it is more practical to make the tape slide back and forth under the head instead.

The tape can be finite, and **automatically extended** with blanks as needed (which is closest to the mathematical definition), but it is more common to think of it as stretching infinitely at both ends and being pre-filled with blanks except on the explicitly given finite fragment the tape head is on. (This is, of course, not implementable in practice.) The tape cannot be fixed in length, since that would not correspond to the given definition and would seriously limit the range of computations the machine can perform to those of a linear bounded automaton.

Contradictions and complementarities:

Definitions in literature sometimes differ slightly, to make arguments or proofs easier or clearer, but this is always done in such a way that the resulting machine has the same computational power. For example, changing the set $\{L, R\}$

to $\{L, R, N\}$, where N ("None" or "No-operation") would allow the machine to stay on the same tape cell instead of moving left or right, does not increase the machine's computational power.

The most common convention represents each "Turing instruction" in a "Turing table" by one of nine 5-tuples, per the convention of Turing/Davis (Turing (1936) in Undecidable, p. 126-127 and Davis (2000) p. 152):

(Definition 1): ($q_i, S_j, S_k/E/N, L/R/N, q_m$)

(Current state q_i , symbol scanned S_j , print symbol S_k /erase E/none N, move_tape_one_square left L/right R/none N, new state q_m)

Other authors (Minsky (1967) p. 119, Hopcroft and Ullman (1979) p. 158, Stone (1972) p. 9) adopt a different convention, with new state q_m listed immediately after the scanned symbol S_j :

(Definition 2): ($q_i, S_j, q_m, S_k/E/N, L/R/N$)

(Current state q_i , symbol scanned S_j , new state q_m , print symbol S_k /erase E/none N, move_tape_one_square left L/right R/none N)

For the remainder of this article "definition 1" (the Turing/Davis convention) will be used.

Example: state table for the 3-state 2-symbol busy beaver reduced to 5-tuples

Current state-Scanned symbol--Print symbol-Move tape-Final (i.e. next) state-5-tuples

A-0--1-R-B-(A, 0, 1, R, B)

A-1--1-L-C-(A, 1, 1, L, C)

B-0--1-L-A-(B, 0, 1, L, A)

B-1--1-R-B-(B, 1, 1, R, B)

C-0--1-L-B-(C, 0, 1, L, B)

C-1--1-N-H-(C, 1, 1, N, H)

In the following table, Turing's original model allowed only the first three lines that he called N1, N2, N3 (cf Turing in Undecidable, p. 126). He allowed for erasure of the "scanned square" by naming a 0th symbol S_0 = "erase" or "blank", etc. However, he did not allow for non-printing, so every instruction-line includes "print symbol S_k " or "erase" (cf footnote 12 in Post (1947), Undecidable p. 300). The abbreviations are Turing's (Undecidable p. 119). Subsequent to Turing's original paper in 1936–1937, machine-models have allowed all nine possible types of five-tuples:

-Current m-configuration (Turing state)-Tape symbol-Print-operation-Tape-motion-Final m-configuration (Turing state)-5-tuple-5-tuple comments-4-tuple

N1-qi-Sj-Print(S_k)-Left L-qm-(qi, Sj, S_k , L, qm)-"blank" = S_0 , 1= S_1 , etc.-

N2-qi-Sj-Print(S_k)-Right R-qm-(qi, Sj, S_k , R, qm)-"blank" = S_0 , 1= S_1 , etc.-

N3-qi-Sj-Print(S_k)-None N-qm-(qi, Sj, S_k , N, qm)-"blank" = S_0 , 1= S_1 , etc.-(qi, Sj, S_k , qm)

4-qi-Sj-None N-Left L-qm-(qi, Sj, N, L, qm)--(qi, Sj, L, qm)

5-qi-Sj-None N-Right R-qm-(qi, Sj, N, R, qm)--(qi, Sj, R, qm)

6-qi-Sj-None N-None N-qm-(qi, Sj, N, N, qm)-Direct "jump"-(qi, Sj, N, qm)

7-qi-Sj-Erase-Left L-qm-(qi, Sj, E, L, qm)--

8-qi-Sj-Erase-Right R-qm-(qi, Sj, E, R, qm)--

9-qi-Sj-Erase-None N-qm-(qi, Sj, E, N, qm)--(qi, Sj, E, qm)

Any Turing table (list of instructions) can be constructed from the above nine 5-tuples. For technical reasons, the three non-printing or "N" instructions (4, 5, 6) can usually be dispensed with. For examples see Turing machine examples.

Less frequently the use of 4-tuples is encountered: these represent a further atomization of the Turing instructions (cf Post (1947), Boolos & Jeffrey (1974, 1999), Davis-Sigal-Weyuker (1994)); also see more at Post–Turing machine.

The "state"

The word "state" used in context of Turing machines can be a source of confusion, as it can mean two things. Most commentators after Turing have used "state" to mean the name/designator of the current instruction to be performed—i.e. the contents of the state register. But Turing (1936) made a strong distinction between a record of what he called the machine's "m-configuration", (its internal state) and the machine's (or person's) "state of progress" through the computation - the current state of the total system. What Turing called "the state formula" includes both the current instruction and all the symbols on the tape:

Thus the state of progress of the computation at any stage is completely determined by the note of instructions and the symbols on the tape. That is, the state of the system may be described by a single expression (sequence of symbols) consisting of the symbols on the tape followed by Δ (which we suppose not to appear elsewhere) and then by the note of instructions. This expression is called the 'state formula'.

—Undecidable, p.139–140, emphasis added

Earlier in his paper Turing carried this even further: he gives an example where he places a symbol of the current "m-configuration"—the instruction's label—beneath the scanned square, together with all the symbols on the tape (Undecidable, p. 121); this he calls "the complete configuration" (Undecidable, p. 118). To print the "complete configuration" on one line he places the state-label/m-configuration to the left of the scanned symbol.

A variant of this is seen in Kleene (1952) where Kleene shows how to write the Gödel number of a machine's "situation": he places the "m-configuration" symbol q_4 over the scanned square in roughly the center of the 6 non-blank squares on the tape (see the Turing-tape figure in this article) and puts it to the right of the scanned square. But Kleene refers to " q_4 " itself as "the machine state" (Kleene, p. 374-375). Hopcroft and Ullman call this composite the "instantaneous description" and follow the Turing convention of putting the "current state" (instruction-label, m-configuration) to the left of the scanned symbol (p. 149).

Example: total state of 3-state 2-symbol busy beaver after 3 "moves" (taken from example "run" in the figure below):

1A1

This means: after three moves the tape has ... 000110000 ... on it, the head is scanning the right-most 1, and the state is A. Blanks (in this case represented by "0"s) can be part of the total state as shown here: B01 ; the tape has a single 1 on it, but the head is scanning the 0 ("blank") to its left and the state is B.

"State" in the context of Turing machines should be clarified as to which is being described: (i) the current instruction, or (ii) the list of symbols on the tape together with the current instruction, or (iii) the list of symbols on the tape together with the current instruction placed to the left of the scanned symbol or to the right of the scanned symbol.

Turing's biographer Andrew Hodges (1983: 107) has noted and discussed this confusion.

Turing machine "state" diagrams

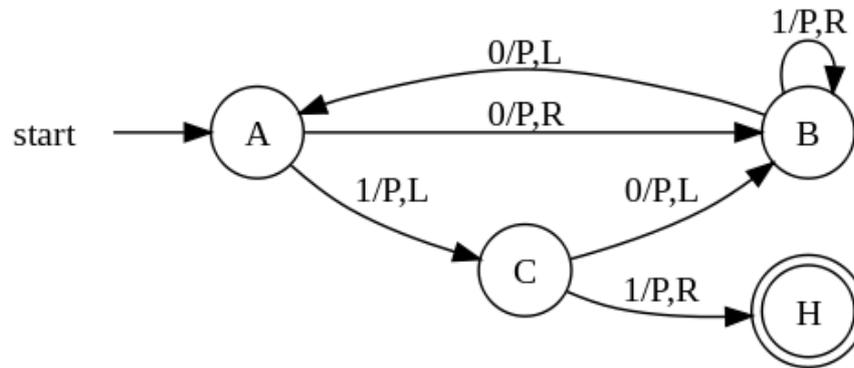

The table for the 3-state busy beaver ("P" = print/write a "1")

Tape symbol-Current state A-Current state B-Current state C

-Write symbol-Move tape-Next state-Write symbol-Move tape-Next state-Write symbol-Move tape-Next state

0-P-R-B-P-L-A-P-L-B

1-P-L-C-P-R-B-P-R-HALT

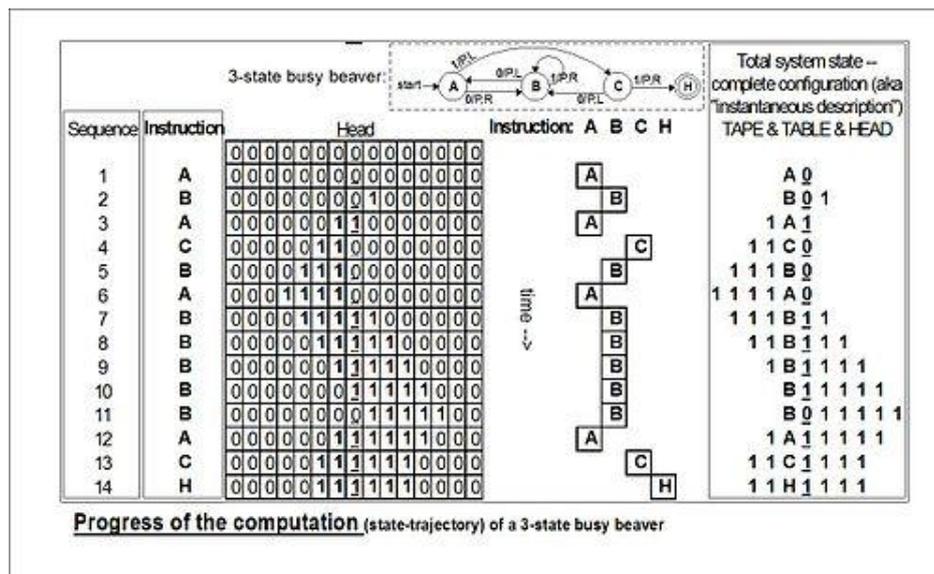

The "3-state busy beaver" Turing machine in a finite state representation. Each circle represents a "state" of the TABLE—an "m-configuration" or "instruction". "Direction" of a state transition is shown by an arrow. The label (e.g. 0/P, R) near the outgoing state (at the "tail" of the arrow) specifies the scanned symbol that causes a particular transition (e.g. 0) followed by a slash /, followed by the subsequent "behaviors" of the machine, e.g. "P Print" then move tape "R Right". No general accepted format exists. The convention shown is after McClusky (1965), Booth (1967), Hill and Peterson (1974).

To the right: the above TABLE as expressed as a "state transition" diagram.

Usually large TABLES are better left as tables (Booth, p. 74). They are more readily simulated by computer in tabular form (Booth, p. 74). However, certain concepts—e.g. machines with "reset" states and machines with repeating patterns (cf Hill and Peterson p. 244ff)—can be more readily seen when viewed as a drawing.

Whether a drawing represents an improvement on its TABLE must be decided by the reader for the particular context. See Finite state machine for more.

The evolution of the busy-beaver's computation starts at the top and proceeds to the bottom.

The reader should again be cautioned that such diagrams represent a snapshot of their TABLE frozen in time, not the course ("trajectory") of a computation through time and/or space. While every time the busy beaver machine "runs" it will always follow the same state-trajectory, this is not true for the "copy" machine that can be provided with variable input "parameters".

The diagram "Progress of the computation" shows the 3-state busy beaver's "state" (instruction) progress through its computation from start to finish. On the far right is the Turing "complete configuration" (Kleene "situation", Hopcroft-Ullman "instantaneous description") at each step. If the machine were to be stopped and cleared to blank both the "state register" and entire tape, these "configurations" could be used to rekindle a computation anywhere in its progress (cf Turing (1936) Undecidable pp. 139-140).

Register machine,

Machines that might be thought to have more computational capability than a simple universal Turing machine can be shown to have no more power (Hopcroft and Ullman p. 159, cf Minsky (1967)). They might compute faster, perhaps, or use less memory, or their instruction set might be smaller, but they cannot compute more powerfully (i.e. more mathematical functions). (Recall that the Church-Turing thesis hypothesizes this to be true for any kind of machine: that anything that can be "computed" can be computed by some Turing machine.)

A Turing machine is equivalent to a pushdown automaton that has been made more flexible and concise by relaxing the last-in-first-out requirement of its stack.

At the other extreme, some very simple models turn out to be Turing-equivalent, i.e. to have the same computational power as the Turing machine model.

Common equivalent models are the multi-tape Turing machine, multi-track Turing machine, machines with input and output, and the non-deterministic Turing machine (NDTM) as opposed to the deterministic Turing machine (DTM) for which the action table has at most one entry for each combination of symbol and state.

Read-only, right-moving Turing machines are equivalent to NDFAs (as well as DFAs by conversion using the NDFA to DFA conversion algorithm).

For practical and didactical intentions the equivalent register machine can be used as a usual assembly programming language.

Choice c-machines, Oracle o-machines

Early in his paper (1936) Turing makes a distinction between an "automatic machine"—its "motion ... completely determined by the configuration" and a "choice machine":

...whose motion is only partially determined by the configuration ... When such a machine reaches one of these ambiguous configurations; it cannot go on until some arbitrary choice has been made by an external operator. This would be the case if we were using machines to deal with axiomatic systems.

—Undecidable, p. 118

Turing (1936) does not elaborate further except in a footnote in which he describes how to use an a-machine to "find all the provable formulae of the [Hilbert] calculus" rather than use a choice machine. He "supposes[s] that the choices are always between two possibilities 0 and 1. Each proof will then be determined by a sequence of choices i_1, i_2, \dots , in ($i_1 = 0$ or $1, i_2 = 0$ or $1, \dots, i_n = 0$ or 1), and hence the number $2^{i_1}2^{n-1} + 2^{i_2}2^{n-2} + \dots + i_n$ completely determines the proof. The automatic machine carries out successively proof 1, proof 2, proof 3, ..." (Footnote ‡, Undecidable, p. 138)

This is indeed the technique by which a deterministic (i.e. a-) Turing machine can be used to mimic the action of a nondeterministic Turing machine; Turing solved the matter in a footnote and appears to dismiss it from further consideration.

An oracle machine or o-machine is a Turing a-machine that pauses its computation at state "o" while, to complete its calculation, it "awaits the decision" of "the oracle"—an unspecified entity "apart from saying that it cannot be a machine" (Turing (1939), Undecidable p. 166–168). The concept is now actively used by mathematicians.

Universal Turing machines

As Turing wrote in Undecidable, p. 128 (italics added):

It is possible to invent a single machine which can be used to compute any computable sequence. If this machine U is supplied with the tape on the beginning of which is written the string of quintuples separated by semicolons of some computing machine M, then U will compute the same sequence as M.

This finding is now taken for granted, but at the time (1936) it was considered astonishing. The model of computation that Turing called his "universal machine"—"U" for short—is considered by some (cf Davis (2000)) to have been the fundamental theoretical breakthrough that led to the notion of the Stored-program computer.

Turing's paper ... contains, in essence, the invention of the modern computer and some of the programming techniques that accompanied it.

—Minsky (1967), p. 104

In terms of computational complexity, a multi-tape universal Turing machine need only be slower by logarithmic factor compared to the machines it simulates. This result was obtained in 1966 by F. C. Hennie and R. E. Stearns. (Arora and Barak, 2009, theorem 1.9)

Comparison with real machines

It is often said that Turing machines, unlike simpler automata, are as powerful as real machines, and are able to execute any operation that a real program can. What is missed in this statement is that, because a real machine can only be in finitely many configurations, in fact this "real machine" is nothing but a linear bounded automaton. On the other hand, Turing machines **are equivalent to** machines that have an unlimited amount of storage space for their computations. In fact, Turing machines are not intended to model computers, but rather they are intended to model computation itself; historically, computers, which compute only on their (fixed) internal storage, were developed only later.

There are a number of ways to explain why Turing machines are useful models of real computers:

Anything a real computer can compute, a Turing machine can also compute. For example: "A Turing machine can simulate any type of subroutine found in programming languages, including recursive procedures and any of the known parameter-passing mechanisms" (Hopcroft and Ullman p. 157). A large enough FSA can also model any real computer, disregarding IO. Thus, a statement about the limitations of Turing machines will also apply to real computers.

The difference lies only with the ability of a Turing machine to manipulate an unbounded amount of data. However, given a finite amount of time, a Turing machine (like a real machine) can only manipulate a finite amount of data.

Like a Turing machine, a real machine can have its storage space enlarged as needed, by acquiring more disks or other storage media. If the supply of these runs short, the Turing machine may become less useful as a model. But the fact is that

neither Turing machines nor real machines need astronomical amounts of storage space in order to perform useful computation. The processing time required is usually much more of a problem.

Descriptions of real machine programs using simpler abstract models are often much more complex than descriptions using Turing machines. For example, a Turing machine describing an algorithm may have a few hundred states, while the equivalent deterministic finite automaton on a given real machine has quadrillions. This makes the DFA representation infeasible to analyze.

Turing machines describe algorithms independent of how much memory they use. There is a limit to the memory possessed by any current machine, but this limit can rise arbitrarily in time. Turing machines allow us to make statements about algorithms which will (theoretically) hold forever, regardless of advances in conventional computing machine architecture.

Turing machines simplify the statement of algorithms. Algorithms running on Turing-equivalent abstract machines are usually more general than their counterparts running on real machines, because they have arbitrary-precision data types available and never have to deal with unexpected conditions (including, but not limited to, running out of memory).

One way in which Turing machines are a poor model for programs is that many real programs, such as operating systems and word processors, are written to receive unbounded input over time, and therefore do not halt. Turing machines do not model such ongoing computation well (but can still model portions of it, such as individual procedures).

Computational complexity theory

A limitation of Turing machines is that they do not model the strengths of a particular arrangement well. For instance, modern stored-program computers are actually instances of a more specific form of abstract machine known as the random access stored program machine or RASP machine model. Like the Universal Turing machine the RASP stores its "program" in "memory" external to its finite-state machine's "instructions". Unlike the universal Turing machine, the RASP has an infinite number of distinguishable, numbered but unbounded "registers"—memory "cells" that can contain any integer (cf. Elgot and Robinson (1964), Hartmanis (1971), and in particular Cook-Rechow (1973); references at random access machine). The RASP's finite-state machine is equipped with the capability for indirect addressing (e.g. the contents of one register can be used as an address to specify another register); thus the RASP's "program" can address any register in the register-sequence. The upshot of this distinction is that there are computational optimizations that can be performed based on the memory indices, which are not possible in a general Turing machine; thus when Turing machines are used as the basis for bounding running times, a 'false lower bound' can be proven on certain algorithms' running times (due to the false simplifying assumption of a Turing machine). An example of this is binary search, an algorithm that can be shown to perform more quickly when using the RASP model of computation rather than the Turing machine model.

Concurrency

Another limitation of Turing machines is that they do not model concurrency well. For example, there is a bound on the size of integer that can be computed by an always-halting nondeterministic Turing machine starting on a blank tape. (See article on unbounded nondeterminism.) By contrast, there are always-halting concurrent systems with no inputs that can compute an integer of unbounded size. (A process can be created with local storage that is initialized with a count of 0 that concurrently sends itself both a stop and a go message. When it receives a go message, it increments its count by 1 and sends itself a go message. When it receives a stop message, it stops with an unbounded number in its local storage.)

Where we suppose

- (A) $(a_i)^{(1)}, (a'_i)^{(1)}, (a''_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (b''_i)^{(1)} > 0,$
 $i, j = 13, 14, 15$
- (B) The functions $(a''_i)^{(1)}, (b''_i)^{(1)}$ are positive continuous increasing and bounded.
Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a''_i)^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b''_i)^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b'_i)^{(1)} \leq (\hat{B}_{13})^{(1)}$$

- (C) $\lim_{T_2 \rightarrow \infty} (a''_i)^{(1)}(T_{14}, t) = (p_i)^{(1)}$
 $\lim_{G \rightarrow \infty} (b''_i)^{(1)}(G, t) = (r_i)^{(1)}$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $\boxed{(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}}$ are positive constants
 and $\boxed{i = 13, 14, 15}$

They satisfy Lipschitz condition:

$$|(a''_i)^{(1)}(T'_{14}, t) - (a''_i)^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T'_{14} - T_{14}| e^{-(\hat{M}_{13})^{(1)}t}$$

$$|(b''_i)^{(1)}(G', t) - (b''_i)^{(1)}(G, t)| < (\hat{k}_{13})^{(1)} \|G' - G\| e^{-(\hat{M}_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(1)}(T'_{14}, t)$ and $(a''_i)^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a''_i)^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a''_i)^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

- (D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}} , \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a'_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13,14,15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a'_i)^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

Definition of $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}$:

Where $\boxed{(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}}$ are positive constants and $\boxed{i = 16,17,18}$

They satisfy Lipschitz condition:

$$|(a''_i)^{(2)}(T'_{17}, t) - (a''_i)^{(2)}(T_{17}, t)| \leq (\hat{k}_{16})^{(2)} |T'_{17} - T_{17}| e^{-(\hat{M}_{16})^{(2)}t} \quad 144$$

$$|(b''_i)^{(2)}((G_{19})', t) - (b''_i)^{(2)}((G_{19}), t)| < (\hat{k}_{16})^{(2)} |(G_{19}) - (G_{19})'| e^{-(\hat{M}_{16})^{(2)}t} \quad 145$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(2)}(T'_{17}, t)$ and $(a''_i)^{(2)}(T_{17}, t)$. (T'_{17}, t) and (T_{17}, t) are points belonging to the interval $[(\hat{k}_{16})^{(2)}, (\hat{M}_{16})^{(2)}]$. It is to be noted that $(a''_i)^{(2)}(T_{17}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{16})^{(2)} = 1$ then the function $(a''_i)^{(2)}(T_{17}, t)$, the SECOND augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$:

(H) (4) $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$, are positive constants 148

$$\frac{(a_i)^{(2)}}{(M_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(M_{16})^{(2)}} < 1$$

Definition of $(\hat{P}_{13})^{(2)}, (\hat{Q}_{13})^{(2)}$: 149

There exists two constants $(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ which together with $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}, (\hat{A}_{16})^{(2)}$ and $(\hat{B}_{16})^{(2)}$ and the constants $(a_i)^{(2)}, (a'_i)^{(2)}, (b_i)^{(2)}, (b'_i)^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}, i = 16,17,18,$

satisfy the inequalities

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(a_i)^{(2)} + (a'_i)^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \quad 150$$

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(b_i)^{(2)} + (b'_i)^{(2)} + (\hat{B}_{16})^{(2)} + (\hat{Q}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \quad 151$$

Where we suppose 152

$$(I) \quad (5) \quad (a_i)^{(3)}, (a'_i)^{(3)}, (a''_i)^{(3)}, (b_i)^{(3)}, (b'_i)^{(3)}, (b''_i)^{(3)} > 0, \quad i, j = 20,21,22 \quad 153$$

The functions $(a''_i)^{(3)}, (b''_i)^{(3)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(3)}, (r_i)^{(3)}$:

$$(a''_i)^{(3)}(T_{21}, t) \leq (p_i)^{(3)} \leq (\hat{A}_{20})^{(3)}$$

$$(b''_i)^{(3)}(G_{23}, t) \leq (r_i)^{(3)} \leq (b'_i)^{(3)} \leq (\hat{B}_{20})^{(3)}$$

$$\lim_{T_2 \rightarrow \infty} (a''_i)^{(3)}(T_{21}, t) = (p_i)^{(3)} \quad 154$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(3)}(G_{23}, t) = (r_i)^{(3)} \quad 155$$

Definition of $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}$: 156

Where $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}$ are positive constants and $i = 20,21,22$

They satisfy Lipschitz condition: 157

$$|(a''_i)^{(3)}(T'_{21}, t) - (a''_i)^{(3)}(T_{21}, t)| \leq (\hat{k}_{20})^{(3)} |T'_{21} - T_{21}| e^{-(M_{20})^{(3)}t} \quad 158$$

$$|(b''_i)^{(3)}(G'_{23}, t) - (b''_i)^{(3)}(G_{23}, t)| < (\hat{k}_{20})^{(3)} ||G_{23} - G'_{23}|| e^{-(M_{20})^{(3)}t} \quad 159$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(3)}(T'_{21}, t)$ and $(a''_i)^{(3)}(T_{21}, t) \cdot (T'_{21}, t)$ and (T_{21}, t) are points belonging to the interval $[(\hat{k}_{20})^{(3)}, (\hat{M}_{20})^{(3)}]$. It is to be noted that $(a''_i)^{(3)}(T_{21}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{20})^{(3)} = 1$ then the function $(a''_i)^{(3)}(T_{21}, t)$, the THIRD augmentation coefficient, would be absolutely continuous. 160

Definition of $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$: 161

(J) $(6) \quad (\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$, are positive constants

$$\frac{(a_i)^{(3)}}{(M_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(M_{20})^{(3)}} < 1$$

There exists two constants $(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ which together with $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}, (\hat{A}_{20})^{(3)}$ and $(\hat{B}_{20})^{(3)}$ and the constants $(a_i)^{(3)}, (a'_i)^{(3)}, (b_i)^{(3)}, (b'_i)^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}, i = 20,21,22,$ 162

satisfy the inequalities 163

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(a_i)^{(3)} + (a'_i)^{(3)} + (\hat{A}_{20})^{(3)} + (\hat{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1 \quad 164$$

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b'_i)^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1 \quad 165$$

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b_i')^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1 \quad 166$$

167

Where we suppose

168

$$(a_i)^{(4)}, (a_i')^{(4)}, (a_i'')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (b_i'')^{(4)} > 0, \quad i, j = 24, 25, 26 \quad 169$$

(L) (7) The functions $(a_i'')^{(4)}, (b_i'')^{(4)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(4)}, (r_i)^{(4)}$:

$$(a_i'')^{(4)}(T_{25}, t) \leq (p_i)^{(4)} \leq (\hat{A}_{24})^{(4)}$$

$$(b_i'')^{(4)}((G_{27}), t) \leq (r_i)^{(4)} \leq (b_i')^{(4)} \leq (\hat{B}_{24})^{(4)}$$

170

$$(M) \quad (8) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(4)}(T_{25}, t) = (p_i)^{(4)} \\ \lim_{G \rightarrow \infty} (b_i'')^{(4)}((G_{27}), t) = (r_i)^{(4)}$$

Definition of $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}$:

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$

They satisfy Lipschitz condition:

171

$$|(a_i'')^{(4)}(T_{25}', t) - (a_i'')^{(4)}(T_{25}, t)| \leq (\hat{k}_{24})^{(4)} |T_{25}' - T_{25}| e^{-(\hat{M}_{24})^{(4)}t}$$

$$|(b_i'')^{(4)}((G_{27})', t) - (b_i'')^{(4)}((G_{27}), t)| < (\hat{k}_{24})^{(4)} |(G_{27})' - (G_{27})| e^{-(\hat{M}_{24})^{(4)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(4)}(T_{25}', t)$ and $(a_i'')^{(4)}(T_{25}, t) \cdot (T_{25}', t)$ and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that $(a_i'')^{(4)}(T_{25}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function $(a_i'')^{(4)}(T_{25}, t)$, the **FOURTH augmentation coefficient WOULD** be absolutely continuous.

172

173

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

174

$(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

175

(P) (9) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}, (\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}, (a_i')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}, i = 24, 25, 26$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a_i')^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b_i')^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

Where we suppose 176

$$(a_i)^{(5)}, (a_i')^{(5)}, (a_i'')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (b_i'')^{(5)} > 0, \quad i, j = 28, 29, 30 \quad 177$$

(R) (10) The functions $(a_i'')^{(5)}, (b_i'')^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}, (r_i)^{(5)}$:

$$(a_i'')^{(5)}(T_{29}, t) \leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)}$$

$$(b_i'')^{(5)}(G_{31}, t) \leq (r_i)^{(5)} \leq (b_i')^{(5)} \leq (\hat{B}_{28})^{(5)}$$

178

$$(S) \quad (11) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(5)}(T_{29}, t) = (p_i)^{(5)} \\ \lim_{G \rightarrow \infty} (b_i'')^{(5)}(G_{31}, t) = (r_i)^{(5)}$$

Definition of $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}$:

Where $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}$ are positive constants and $i = 28, 29, 30$

They satisfy Lipschitz condition: 179

$$|(a_i'')^{(5)}(T'_{29}, t) - (a_i'')^{(5)}(T_{29}, t)| \leq (\hat{k}_{28})^{(5)} |T_{29} - T'_{29}| e^{-(\hat{M}_{28})^{(5)}t}$$

$$|(b_i'')^{(5)}(G'_{31}, t) - (b_i'')^{(5)}(G_{31}, t)| < (\hat{k}_{28})^{(5)} |(G_{31}) - (G'_{31})| e^{-(\hat{M}_{28})^{(5)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(5)}(T'_{29}, t)$ and $(a_i'')^{(5)}(T_{29}, t)$. (T'_{29}, t) and (T_{29}, t) are points belonging to the interval $[(\hat{k}_{28})^{(5)}, (\hat{M}_{28})^{(5)}]$. It is to be noted that $(a_i'')^{(5)}(T_{29}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{28})^{(5)} = 5$ then the function $(a_i'')^{(5)}(T_{29}, t)$, the FIFTH **augmentation coefficient** attributable would be absolutely continuous. 180

Definition of $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$: 181

$(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$, are positive constants

$$\frac{(a_i)^{(5)}}{(\hat{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\hat{M}_{28})^{(5)}} < 1$$

Definition of $(\hat{P}_{28})^{(5)}, (\hat{Q}_{28})^{(5)}$: 182

There exists two constants $(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ which together with $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}, (\hat{A}_{28})^{(5)}$ and $(\hat{B}_{28})^{(5)}$ and the constants $(a_i)^{(5)}, (a_i')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}, i = 28, 29, 30$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(a_i)^{(5)} + (a_i')^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(b_i)^{(5)} + (b_i')^{(5)} + (\hat{B}_{28})^{(5)} + (\hat{Q}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

Where we suppose 183

$$(a_i)^{(6)}, (a_i')^{(6)}, (a_i'')^{(6)}, (b_i)^{(6)}, (b_i')^{(6)}, (b_i'')^{(6)} > 0, \quad i, j = 32, 33, 34 \quad 184$$

(12) The functions $(a_i'')^{(6)}, (b_i'')^{(6)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(6)}, (r_i)^{(6)}$:

$$(a_i'')^{(6)}(T_{33}, t) \leq (p_i)^{(6)} \leq (\hat{A}_{32})^{(6)}$$

$$(b_i'')^{(6)}(G_{35}, t) \leq (r_i)^{(6)} \leq (b_i')^{(6)} \leq (\hat{B}_{32})^{(6)}$$

Where $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}$ are positive constants and $i = 32, 33, 34$

They satisfy Lipschitz condition:

186

$$|(a_i'')^{(6)}(T_{33}', t) - (a_i'')^{(6)}(T_{33}, t)| \leq (\hat{k}_{32})^{(6)} |T_{33}' - T_{33}| e^{-(M_{32})^{(6)}t}$$

$$|(b_i'')^{(6)}(G_{35}', t) - (b_i'')^{(6)}(G_{35}, t)| < (\hat{k}_{32})^{(6)} |(G_{35}') - (G_{35})| e^{-(M_{32})^{(6)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(6)}(T_{33}', t)$ and $(a_i'')^{(6)}(T_{33}, t)$. (T_{33}', t) and (T_{33}, t) are points belonging to the interval $[(\hat{k}_{32})^{(6)}, (\hat{M}_{32})^{(6)}]$. It is to be noted that $(a_i'')^{(6)}(T_{33}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{32})^{(6)} = 6$ then the function $(a_i'')^{(6)}(T_{33}, t)$, the SIXTH **augmentation coefficient** would be absolutely continuous.

187

Definition of $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$:

188

$(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$ are positive constants

$$\frac{(a_i)^{(6)}}{(M_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(M_{32})^{(6)}} < 1$$

Definition of $(\hat{P}_{32})^{(6)}, (\hat{Q}_{32})^{(6)}$:

189

There exists two constants $(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ which together with $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}, (\hat{A}_{32})^{(6)}$ and $(\hat{B}_{32})^{(6)}$ and the constants $(a_i)^{(6)}, (a_i')^{(6)}, (b_i)^{(6)}, (b_i')^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}, i = 32, 33, 34$, satisfy the inequalities

$$\frac{1}{(M_{32})^{(6)}} [(a_i)^{(6)} + (a_i')^{(6)} + (\hat{A}_{32})^{(6)} + (\hat{P}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

$$\frac{1}{(M_{32})^{(6)}} [(b_i)^{(6)} + (b_i')^{(6)} + (\hat{B}_{32})^{(6)} + (\hat{Q}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

Where we suppose

190

$$(V) \quad (a_i)^{(7)}, (a_i')^{(7)}, (a_i'')^{(7)}, (b_i)^{(7)}, (b_i')^{(7)}, (b_i'')^{(7)} > 0,$$

$$i, j = 36, 37, 38$$

191

(W) The functions $(a_i'')^{(7)}, (b_i'')^{(7)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(7)}, (r_i)^{(7)}$:

$$(a_i'')^{(7)}(T_{37}, t) \leq (p_i)^{(7)} \leq (\hat{A}_{36})^{(7)}$$

$$(b_i'')^{(7)}(G, t) \leq (r_i)^{(7)} \leq (b_i')^{(7)} \leq (\hat{B}_{36})^{(7)}$$

$$\lim_{T_2 \rightarrow \infty} (a_i'')^{(7)}(T_{37}, t) = (p_i)^{(7)}$$

192

$$\lim_{G \rightarrow \infty} (b_i'')^{(7)}(G_{39}, t) = (r_i)^{(7)}$$

Definition of $(\hat{A}_{36})^{(7)}, (\hat{B}_{36})^{(7)}$:

Where $(\hat{A}_{36})^{(7)}, (\hat{B}_{36})^{(7)}, (p_i)^{(7)}, (r_i)^{(7)}$ are positive constants
 and $i = 36, 37, 38$

They satisfy Lipschitz condition:

193

$$|(a_i'')^{(7)}(T_{37}, t) - (a_i'')^{(7)}(T_{37}, t)| \leq (\hat{k}_{36})^{(7)} |T_{37} - T_{37}'| e^{-(\hat{M}_{36})^{(7)}t}$$

$$|(b_i'')^{(7)}((G_{39})', t) - (b_i'')^{(7)}((G_{39}), (T_{39}))| < (\hat{k}_{36})^{(7)} |(G_{39}) - (G_{39})'| e^{-(\hat{M}_{36})^{(7)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(7)}(T_{37}, t)$ and $(a_i'')^{(7)}(T_{37}, t) \cdot (T_{37}, t)$ and (T_{37}, t) are points belonging to the interval $[(\hat{k}_{36})^{(7)}, (\hat{M}_{36})^{(7)}]$. It is to be noted that $(a_i'')^{(7)}(T_{37}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{36})^{(7)} = 7$ then the function $(a_i'')^{(7)}(T_{37}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

194

Definition of $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}$:

195

(X) $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}$, are positive constants
 $\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}}, \frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} < 1$

Definition of $(\hat{P}_{36})^{(7)}, (\hat{Q}_{36})^{(7)}$:

196

(Y) There exists two constants $(\hat{P}_{36})^{(7)}$ and $(\hat{Q}_{36})^{(7)}$ which together with $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}, (\hat{A}_{36})^{(7)}$ and $(\hat{B}_{36})^{(7)}$ and the constants $(a_i)^{(7)}, (a_i')^{(7)}, (b_i)^{(7)}, (b_i')^{(7)}, (p_i)^{(7)}, (r_i)^{(7)}, i = 36, 37, 38$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{36})^{(7)}} [(a_i)^{(7)} + (a_i')^{(7)} + (\hat{A}_{36})^{(7)} + (\hat{P}_{36})^{(7)} (\hat{k}_{36})^{(7)}] < 1$$

$$\frac{1}{(\hat{M}_{36})^{(7)}} [(b_i)^{(7)} + (b_i')^{(7)} + (\hat{B}_{36})^{(7)} + (\hat{Q}_{36})^{(7)} (\hat{k}_{36})^{(7)}] < 1$$

Definition of $G_i(0), T_i(0)$:

197

$$G_i(t) \leq (\hat{P}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)}t}, \quad G_i(0) = G_i^0 > 0$$

$$T_i(t) \leq (\hat{Q}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)}t}, \quad T_i(0) = T_i^0 > 0$$

198

Definition of $G_i(0), T_i(0)$:

199

$$G_i(t) \leq (\hat{P}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}, \quad G_i(0) = G_i^0 > 0$$

$$T_i(t) \leq (\hat{Q}_{32})^{(6)} e^{(\hat{M}_{32})^{(6)}t}, \quad T_i(0) = T_i^0 > 0$$

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{36})^{(7)} e^{(\hat{M}_{36})^{(7)}t}, \quad G_i(0) = G_i^0 > 0$$

$$T_i(t) \leq (\hat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t} , \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof: Consider operator $\mathcal{A}^{(1)}$ defined on the space of sextuples of continuous functions $G_i, T_i: \mathbb{R}_+ \rightarrow \mathbb{R}_+$ which satisfy 200

$$G_i(0) = G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{13})^{(1)}, T_i^0 \leq (\hat{Q}_{13})^{(1)}, \quad 201$$

Consider operator $\mathcal{A}^{(6)}$ defined on the space of sextuples of continuous functions $G_i, T_i: \mathbb{R}_+ \rightarrow \mathbb{R}_+$ which satisfy 252

$$G_i(0) = G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{32})^{(6)}, T_i^0 \leq (\hat{Q}_{32})^{(6)}, \quad 253$$

$$0 \leq G_i(t) - G_i^0 \leq (\hat{P}_{32})^{(6)} e^{(M_{32})^{(6)}t} \quad 254$$

$$0 \leq T_i(t) - T_i^0 \leq (\hat{Q}_{32})^{(6)} e^{(M_{32})^{(6)}t} \quad 255$$

By 256

$$\bar{G}_{32}(t) = G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} G_{33}(s_{(32)}) - \left((a'_{32})^{(6)} + (a''_{32})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{32}(s_{(32)}) \right] ds_{(32)}$$

$$\bar{G}_{33}(t) = G_{33}^0 + \int_0^t \left[(a_{33})^{(6)} G_{32}(s_{(32)}) - \left((a'_{33})^{(6)} + (a''_{33})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{33}(s_{(32)}) \right] ds_{(32)} \quad 257$$

$$\bar{G}_{34}(t) = G_{34}^0 + \int_0^t \left[(a_{34})^{(6)} G_{33}(s_{(32)}) - \left((a'_{34})^{(6)} + (a''_{34})^{(6)} (T_{33}(s_{(32)}), s_{(32)}) \right) G_{34}(s_{(32)}) \right] ds_{(32)} \quad 258$$

$$\bar{T}_{32}(t) = T_{32}^0 + \int_0^t \left[(b_{32})^{(6)} T_{33}(s_{(32)}) - \left((b'_{32})^{(6)} - (b''_{32})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{32}(s_{(32)}) \right] ds_{(32)} \quad 259$$

$$\bar{T}_{33}(t) = T_{33}^0 + \int_0^t \left[(b_{33})^{(6)} T_{32}(s_{(32)}) - \left((b'_{33})^{(6)} - (b''_{33})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{33}(s_{(32)}) \right] ds_{(32)} \quad 260$$

$$\bar{T}_{34}(t) = T_{34}^0 + \int_0^t \left[(b_{34})^{(6)} T_{33}(s_{(32)}) - \left((b'_{34})^{(6)} - (b''_{34})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{34}(s_{(32)}) \right] ds_{(32)} \quad 261$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$

: if the conditions IN THE FOREGOING are fulfilled, there exists a solution satisfying the conditions 262

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof:

Consider operator $\mathcal{A}^{(7)}$ defined on the space of sextuples of continuous functions $G_i, T_i: \mathbb{R}_+ \rightarrow \mathbb{R}_+$ which satisfy

$$G_i(0) = G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{36})^{(7)}, T_i^0 \leq (\hat{Q}_{36})^{(7)}, \quad 263$$

$$0 \leq G_i(t) - G_i^0 \leq (\hat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t} \quad 264$$

$$0 \leq T_i(t) - T_i^0 \leq (\hat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t} \quad 265$$

By 266

$$\bar{G}_{36}(t) = G_{36}^0 + \int_0^t \left[(a_{36})^{(7)} G_{37}(s_{(36)}) - \left((a'_{36})^{(7)} + a''_{36})^{(7)} (T_{37}(s_{(36)}), s_{(36)}) \right) G_{36}(s_{(36)}) \right] ds_{(36)} \quad 267$$

$$\bar{G}_{37}(t) = G_{37}^0 + \int_0^t \left[(a_{37})^{(7)} G_{36}(s_{(36)}) - \left((a'_{37})^{(7)} + (a''_{37})^{(7)} (T_{37}(s_{(36)}), s_{(36)}) \right) G_{37}(s_{(36)}) \right] ds_{(36)}$$

$$\bar{G}_{38}(t) = G_{38}^0 + \int_0^t \left[(a_{38})^{(7)} G_{37}(s_{(36)}) - \left((a'_{38})^{(7)} + (a''_{38})^{(7)} (T_{37}(s_{(36)}), s_{(36)}) \right) G_{38}(s_{(36)}) \right] ds_{(36)} \quad 268$$

$$\bar{T}_{36}(t) = T_{36}^0 + \int_0^t \left[(b_{36})^{(7)} T_{37}(s_{(36)}) - \left((b'_{36})^{(7)} - (b''_{36})^{(7)} (G(s_{(36)}), s_{(36)}) \right) T_{36}(s_{(36)}) \right] ds_{(36)} \quad 269$$

$$\bar{T}_{37}(t) = T_{37}^0 + \int_0^t \left[(b_{37})^{(7)} T_{36}(s_{(36)}) - \left((b'_{37})^{(7)} - (b''_{37})^{(7)} (G(s_{(36)}), s_{(36)}) \right) T_{37}(s_{(36)}) \right] ds_{(36)} \quad 270$$

$$\bar{T}_{38}(t) = T_{38}^0 + \int_0^t \left[(b_{38})^{(7)} T_{37}(s_{(36)}) - \left((b'_{38})^{(7)} - (b''_{38})^{(7)} (G(s_{(36)}), s_{(36)}) \right) T_{38}(s_{(36)}) \right] ds_{(36)} \quad 271$$

Where $s_{(36)}$ is the integrand that is integrated over an interval $(0, t)$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$ 272

(a) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that 273

$$G_{24}(t) \leq G_{24}^0 + \int_0^t \left[(a_{24})^{(4)} \left(G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(\bar{M}_{24})^{(4)} s_{(24)}} \right) \right] ds_{(24)} =$$

$$(1 + (a_{24})^{(4)} t) G_{25}^0 + \frac{(a_{24})^{(4)} (\hat{P}_{24})^{(4)}}{(\bar{M}_{24})^{(4)}} \left(e^{(\bar{M}_{24})^{(4)} t} - 1 \right)$$

From which it follows that 274

$$(G_{24}(t) - G_{24}^0) e^{-(\bar{M}_{24})^{(4)} t} \leq \frac{(a_{24})^{(4)}}{(\bar{M}_{24})^{(4)}} \left[\left((\hat{P}_{24})^{(4)} + G_{25}^0 \right) e^{\left(-\frac{(\hat{P}_{24})^{(4)} + G_{25}^0}{G_{25}^0} \right)} + (\hat{P}_{24})^{(4)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

(b) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that 275

$$G_{28}(t) \leq G_{28}^0 + \int_0^t \left[(a_{28})^{(5)} \left(G_{29}^0 + (\hat{P}_{28})^{(5)} e^{(\bar{M}_{28})^{(5)} s_{(28)}} \right) \right] ds_{(28)} =$$

$$(1 + (a_{28})^{(5)} t) G_{29}^0 + \frac{(a_{28})^{(5)} (\hat{P}_{28})^{(5)}}{(\bar{M}_{28})^{(5)}} \left(e^{(\bar{M}_{28})^{(5)} t} - 1 \right)$$

From which it follows that 276

$$(G_{28}(t) - G_{28}^0) e^{-(\bar{M}_{28})^{(5)} t} \leq \frac{(a_{28})^{(5)}}{(\bar{M}_{28})^{(5)}} \left[\left((\hat{P}_{28})^{(5)} + G_{29}^0 \right) e^{\left(-\frac{(\hat{P}_{28})^{(5)} + G_{29}^0}{G_{29}^0} \right)} + (\hat{P}_{28})^{(5)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

(c) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that 277

$$G_{32}(t) \leq G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} \left(G_{33}^0 + (\hat{P}_{32})^{(6)} e^{(\bar{M}_{32})^{(6)} s_{(32)}} \right) \right] ds_{(32)} =$$

$$(1 + (a_{32})^{(6)} t) G_{33}^0 + \frac{(a_{32})^{(6)} (\hat{P}_{32})^{(6)}}{(\bar{M}_{32})^{(6)}} \left(e^{(\bar{M}_{32})^{(6)} t} - 1 \right)$$

From which it follows that 278

$$(G_{32}(t) - G_{32}^0) e^{-(\bar{M}_{32})^{(6)} t} \leq \frac{(a_{32})^{(6)}}{(\bar{M}_{32})^{(6)}} \left[\left((\hat{P}_{32})^{(6)} + G_{33}^0 \right) e^{\left(-\frac{(\hat{P}_{32})^{(6)} + G_{33}^0}{G_{33}^0} \right)} + (\hat{P}_{32})^{(6)} \right]$$

(G_i^0) is as defined in the statement of theorem1

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$

(d) The operator $\mathcal{A}^{(7)}$ maps the space of functions satisfying 37,35,36 into itself .Indeed it is obvious that 279

$$G_{36}(t) \leq G_{36}^0 + \int_0^t \left[(a_{36})^{(7)} \left(G_{37}^0 + (\hat{P}_{36})^{(7)} e^{(\bar{M}_{36})^{(7)} s_{(36)}} \right) \right] ds_{(36)} =$$

$$(1 + (a_{36})^{(7)} t) G_{37}^0 + \frac{(a_{36})^{(7)} (\hat{P}_{36})^{(7)}}{(\bar{M}_{36})^{(7)}} \left(e^{(\bar{M}_{36})^{(7)} t} - 1 \right)$$

280

From which it follows that

$$(G_{36}(t) - G_{36}^0)e^{-(M_{36})^{(7)}t} \leq \frac{(a_{36})^{(7)}}{(M_{36})^{(7)}} \left[((\hat{P}_{36})^{(7)} + G_{37}^0)e^{-\frac{(\hat{P}_{36})^{(7)} + G_{37}^0}{G_{37}^0}} + (\hat{P}_{36})^{(7)} \right]$$

(G_i^0) is as defined in the statement of theorem 7

It is now sufficient to take $\frac{(a_i)^{(1)}}{(M_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(M_{13})^{(1)}} < 1$ and to choose 281

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have 282

$$\frac{(a_i)^{(1)}}{(M_{13})^{(1)}} \left[(\hat{P}_{13})^{(1)} + ((\hat{P}_{13})^{(1)} + G_j^0)e^{-\frac{(\hat{P}_{13})^{(1)} + G_j^0}{G_j^0}} \right] \leq (\hat{P}_{13})^{(1)} \quad 283$$

$$\frac{(b_i)^{(1)}}{(M_{13})^{(1)}} \left[((\hat{Q}_{13})^{(1)} + T_j^0)e^{-\frac{(\hat{Q}_{13})^{(1)} + T_j^0}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)} \quad 284$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself 285

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric 286

$$d((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)})) = \sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{13})^{(1)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{13})^{(1)}t} \}$$

Indeed if we denote 287

Definition of \tilde{G}, \tilde{T} :

$$(\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_{13}^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(M_{13})^{(1)}s_{(13)}} e^{(M_{13})^{(1)}s_{(13)}} ds_{(13)} + \int_0^t \{ (a'_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(M_{13})^{(1)}s_{(13)}} e^{-(M_{13})^{(1)}s_{(13)}} + (a''_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(M_{13})^{(1)}s_{(13)}} e^{(M_{13})^{(1)}s_{(13)}} + G_{13}^{(2)} | (a'_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) - (a'_{13})^{(1)} (T_{14}^{(2)}, s_{(13)}) | e^{-(M_{13})^{(1)}s_{(13)}} e^{(M_{13})^{(1)}s_{(13)}} \} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|G^{(1)} - G^{(2)}| e^{-(M_{13})^{(1)}t} \leq \frac{1}{(M_{13})^{(1)}} ((a_{13})^{(1)} + (a'_{13})^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}) d((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)})) \quad 288$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a'_{13})^{(1)}$ and $(b'_{13})^{(1)}$ depending also on t can be considered as not 289

conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ and $(\widehat{Q}_{13})^{(1)} e^{(\widehat{M}_{13})^{(1)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$, $i = 13,14,15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 290

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(1)} - (a_i'')^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}} \geq 0 \quad 291$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(1)}t} > 0 \quad \text{for } t > 0$$

Definition of $((\widehat{M}_{13})^{(1)})_1$, and $((\widehat{M}_{13})^{(1)})_3$: 292

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$$G_{13} < ((\widehat{M}_{13})^{(1)}) \text{ it follows } \frac{dG_{14}}{dt} \leq ((\widehat{M}_{13})^{(1)})_1 - (a'_{14})^{(1)}G_{14} \text{ and by integrating}$$

$$G_{14} \leq ((\widehat{M}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)}((\widehat{M}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\widehat{M}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)}((\widehat{M}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 293

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(1)}(G(t), t)) = (b'_{14})^{(1)}$ then $T_{14} \rightarrow \infty$. 294

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to 295

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_1}$ By taking now ε_1 sufficiently small one sees that T_{14} is unbounded. The same property holds for T_{15} if $\lim_{t \rightarrow \infty} (b_{15}'')^{(1)}(G(t), t) = (b'_{15})^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

296

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} , \frac{(b_i)^{(2)}}{(\widehat{M}_{16})^{(2)}} < 1$ and to choose

297

$(\widehat{P}_{16})^{(2)}$ and $(\widehat{Q}_{16})^{(2)}$ large to have

$$\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\hat{P}_{16})^{(2)}) + ((\hat{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\hat{P}_{16})^{(2)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{16})^{(2)} \quad 298$$

$$\frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\hat{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{16})^{(2)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{16})^{(2)} \right] \leq (\hat{Q}_{16})^{(2)} \quad 299$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i satisfying 300

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric 301

$$d\left((G_{19})^{(1)}, (T_{19})^{(1)}, (G_{19})^{(2)}, (T_{19})^{(2)} \right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t} \right\}$$

Indeed if we denote 302

Definition of $\tilde{G}_{19}, \tilde{T}_{19} : (\tilde{G}_{19}, \tilde{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19})$

It results 303

$$\begin{aligned} |\tilde{G}_{16}^{(1)} - \tilde{G}_{16}^{(2)}| &\leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} ds_{(16)} + \\ &\int_0^t \{ (a'_{16})^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{-(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &(a''_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &G_{16}^{(2)} | (a'_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) - (a''_{16})^{(2)} (T_{17}^{(2)}, s_{(16)}) | e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} \} ds_{(16)} \end{aligned}$$

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$ 304

From the hypotheses it follows

$$\begin{aligned} |(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\bar{M}_{16})^{(2)}t} &\leq \\ \frac{1}{(\bar{M}_{16})^{(2)}} \left((a_{16})^{(2)} + (a'_{16})^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{\kappa}_{16})^{(2)} \right) &d\left((G_{19})^{(1)}, (T_{19})^{(1)}, (G_{19})^{(2)}, (T_{19})^{(2)} \right) \end{aligned} \quad 305$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows 306

Remark 1: The fact that we supposed $(a''_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ and $(\hat{Q}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ respectively of \mathbb{R}_+ . 307

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(2)}$ and $(b''_i)^{(2)}$, $i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 308

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(2)} - (a''_i)^{(2)} (T_{17}(s_{(16)}), s_{(16)}) \} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(2)}t} > 0 \quad \text{for } t > 0$$

Definition of $((\widehat{M}_{16})^{(2)})_1$, $((\widehat{M}_{16})^{(2)})_2$ and $((\widehat{M}_{16})^{(2)})_3$: 309

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if

$G_{16} < ((\widehat{M}_{16})^{(2)})$ it follows $\frac{dG_{17}}{dt} \leq ((\widehat{M}_{16})^{(2)})_1 - (a'_{17})^{(2)}G_{17}$ and by integrating

$$G_{17} \leq ((\widehat{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)}((\widehat{M}_{16})^{(2)})_1 / (a'_{17})^{(2)}$$

In the same way , one can obtain

$$G_{18} \leq ((\widehat{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)}((\widehat{M}_{16})^{(2)})_2 / (a'_{18})^{(2)} \tag{310}$$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively.

Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below. 311

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(2)}((G_{19})(t), t)) = (b'_{17})^{(2)}$ then $T_{17} \rightarrow \infty$. 312

Definition of $(m)^{(2)}$ and ε_2 :

Indeed let t_2 be so that for $t > t_2$

$$(b_{17})^{(2)} - (b''_i)^{(2)}((G_{19})(t), t) < \varepsilon_2, T_{16}(t) > (m)^{(2)}$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)}(m)^{(2)} - \varepsilon_2 T_{17}$ which leads to 313

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_2} \text{ By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The same property holds for } T_{18} \text{ if } \lim_{t \rightarrow \infty} (b''_{18})^{(2)}((G_{19})(t), t) = (b'_{18})^{(2)} \tag{314}$$

We now state a more precise theorem about the behaviors at infinity of the solutions

315

It is now sufficient to take $\frac{(a_i)^{(3)}}{(M_{20})^{(3)}} , \frac{(b_i)^{(3)}}{(M_{20})^{(3)}} < 1$ and to choose 316

$(\widehat{P}_{20})^{(3)}$ and $(\widehat{Q}_{20})^{(3)}$ large to have

$$\frac{(a_i)^{(3)}}{(M_{20})^{(3)}} \left[(\widehat{P}_{20})^{(3)} + ((\widehat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{20})^{(3)} \tag{317}$$

$$\frac{(b_i)^{(3)}}{(M_{20})^{(3)}} \left[((\widehat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{20})^{(3)} \right] \leq (\widehat{Q}_{20})^{(3)} \tag{318}$$

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i into itself 319

The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric 320

$$d \left(((G_{23})^{(1)}, (T_{23})^{(1)}), ((G_{23})^{(2)}, (T_{23})^{(2)}) \right) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{20})^{(3)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{20})^{(3)}t} \}$$

Indeed if we denote 321

Definition of $\widetilde{G}_{23}, \widetilde{T}_{23} : ((\widetilde{G}_{23}), (\widetilde{T}_{23})) = \mathcal{A}^{(3)}((G_{23}), (T_{23}))$

It results 322

$$\begin{aligned}
 |\widetilde{G}_{20}^{(1)} - \widetilde{G}_i^{(2)}| &\leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}} ds_{(20)} + \\
 &\int_0^t \{(a'_{20})^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{-(\overline{M}_{20})^{(3)}s_{(20)}} + \\
 &(a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}} + \\
 &G_{20}^{(2)} |(a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a''_{20})^{(3)} (T_{21}^{(2)}, s_{(20)})| e^{-(\overline{M}_{20})^{(3)}s_{(20)}} e^{(\overline{M}_{20})^{(3)}s_{(20)}}\} ds_{(20)}
 \end{aligned}$$
323

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\begin{aligned}
 |G^{(1)} - G^{(2)}| e^{-(\overline{M}_{20})^{(3)}t} &\leq \\
 \frac{1}{(\overline{M}_{20})^{(3)}} &((a_{20})^{(3)} + (a'_{20})^{(3)} + (\widehat{A}_{20})^{(3)} + (\widehat{P}_{20})^{(3)} (\widehat{k}_{20})^{(3)}) d\left(((G_{23})^{(1)}, (T_{23})^{(1)}); (G_{23})^{(2)}, (T_{23})^{(2)} \right)
 \end{aligned}$$
324

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{20})^{(3)}$ and $(b''_{20})^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{20})^{(3)} e^{(\overline{M}_{20})^{(3)}t}$ and $(\widehat{Q}_{20})^{(3)} e^{(\overline{M}_{20})^{(3)}t}$ respectively of \mathbb{R}_+ . 325

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$, $i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 326

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{[-\int_0^t \{(a'_i)^{(3)} - (a''_i)^{(3)}\} (T_{21}(s_{(20)}), s_{(20)})\} ds_{(20)}]} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(3)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{20})^{(3)})_1, ((\widehat{M}_{20})^{(3)})_2$ and $((\widehat{M}_{20})^{(3)})_3$: 327

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$$G_{20} < (\widehat{M}_{20})^{(3)} \text{ it follows } \frac{dG_{21}}{dt} \leq ((\widehat{M}_{20})^{(3)})_1 - (a'_{21})^{(3)} G_{21} \text{ and by integrating}$$

$$G_{21} \leq ((\widehat{M}_{20})^{(3)})_2 = G_{21}^0 + 2(a_{21})^{(3)} ((\widehat{M}_{20})^{(3)})_1 / (a'_{21})^{(3)}$$

In the same way, one can obtain

$$G_{22} \leq ((\widehat{M}_{20})^{(3)})_3 = G_{22}^0 + 2(a_{22})^{(3)} ((\widehat{M}_{20})^{(3)})_2 / (a'_{22})^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively.

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below. 328

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(3)} ((G_{23})(t), t)) = (b'_{21})^{(3)}$ then $T_{21} \rightarrow \infty$. 329

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$ 330

$$(b_{21})^{(3)} - (b_i'')^{(3)}((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)}$$

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)}(m)^{(3)} - \varepsilon_3 T_{21}$ which leads to 331

$$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_3}$ By taking now ε_3 sufficiently small one sees that T_{21} is unbounded. The same property holds for T_{22} if $\lim_{t \rightarrow \infty} (b_{22}'')^{(3)}((G_{23})(t), t) = (b_{22}')^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

332

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} < 1$ and to choose 333

$(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ large to have

$$\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}} \left[(\hat{P}_{24})^{(4)} + ((\hat{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\hat{P}_{24})^{(4)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{24})^{(4)} \quad 334$$

$$\frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} \left[((\hat{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{24})^{(4)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{24})^{(4)} \right] \leq (\hat{Q}_{24})^{(4)} \quad 335$$

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i satisfying IN to itself 336

The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric 337

$$d \left(((G_{27})^{(1)}, (T_{27})^{(1)}), ((G_{27})^{(2)}, (T_{27})^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{24})^{(4)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{24})^{(4)}t} \right\}$$

Indeed if we denote

$$\text{Definition of } (\widetilde{G_{27}}, \widetilde{T_{27}}) : (\widetilde{G_{27}}, \widetilde{T_{27}}) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$$

It results

$$\begin{aligned} |\tilde{G}_{24}^{(1)} - \tilde{G}_i^{(2)}| &\leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\bar{M}_{24})^{(4)}s_{(24)}} e^{(\bar{M}_{24})^{(4)}s_{(24)}} ds_{(24)} + \\ &\int_0^t \{ (a_{24}')^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\bar{M}_{24})^{(4)}s_{(24)}} e^{-(\bar{M}_{24})^{(4)}s_{(24)}} + \\ &(a_{24}'')^{(4)}(T_{25}^{(1)}, s_{(24)}) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\bar{M}_{24})^{(4)}s_{(24)}} e^{(\bar{M}_{24})^{(4)}s_{(24)}} + \\ &G_{24}^{(2)} |(a_{24}'')^{(4)}(T_{25}^{(1)}, s_{(24)}) - (a_{24}'')^{(4)}(T_{25}^{(2)}, s_{(24)})| e^{-(\bar{M}_{24})^{(4)}s_{(24)}} e^{(\bar{M}_{24})^{(4)}s_{(24)}} \} ds_{(24)} \end{aligned}$$

Where $s_{(24)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\widehat{M}_{24})^{(4)}t} \leq \frac{1}{(\widehat{M}_{24})^{(4)}} ((a_{24})^{(4)} + (a'_{24})^{(4)} + (\widehat{A}_{24})^{(4)} + (\widehat{P}_{24})^{(4)}(\widehat{K}_{24})^{(4)}) d \left(((G_{27})^{(1)}, (T_{27})^{(1)}); (G_{27})^{(2)}, (T_{27})^{(2)} \right) \tag{339}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{24})^{(4)}$ and $(b''_{24})^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ and $(\widehat{Q}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ respectively of \mathbb{R}_+ . 340

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(4)}$ and $(b''_i)^{(4)}, i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 341

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(4)} - (a''_i)^{(4)}(T_{25}(s_{(24)}), s_{(24)})\} ds_{(24)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(4)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{24})^{(4)})_1, ((\widehat{M}_{24})^{(4)})_2$ and $((\widehat{M}_{24})^{(4)})_3$: 342

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$$G_{24} < ((\widehat{M}_{24})^{(4)})_1 \text{ it follows } \frac{dG_{25}}{dt} \leq ((\widehat{M}_{24})^{(4)})_1 - (a'_{25})^{(4)}G_{25} \text{ and by integrating}$$

$$G_{25} \leq ((\widehat{M}_{24})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)}((\widehat{M}_{24})^{(4)})_1 / (a'_{25})^{(4)}$$

In the same way, one can obtain

$$G_{26} \leq ((\widehat{M}_{24})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)}((\widehat{M}_{24})^{(4)})_2 / (a'_{26})^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24} , G_{26} and G_{24} , G_{25} respectively.

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below. 343

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(4)}((G_{27})(t), t)) = (b'_{25})^{(4)}$ then $T_{25} \rightarrow \infty$. 344

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25})^{(4)} - (b''_i)^{(4)}((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)}$$

Then $\frac{dT_{25}}{dt} \geq (a_{25})^{(4)}(m)^{(4)} - \varepsilon_4 T_{25}$ which leads to 345

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_4} \text{ By taking now } \varepsilon_4 \text{ sufficiently small one sees that } T_{25} \text{ is unbounded. The}$$

same property holds for T_{26} if $\lim_{t \rightarrow \infty} (b''_{26})^{(4)}((G_{27})(t), t) = (b'_{26})^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ANALOGOUS inequalities hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$

346

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\bar{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\bar{M}_{28})^{(5)}} < 1$ and to choose

347

$(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ large to have

$$\frac{(a_i)^{(5)}}{(\bar{M}_{28})^{(5)}} \left[(\hat{P}_{28})^{(5)} + ((\hat{P}_{28})^{(5)} + G_j^0) e^{-\left(\frac{(\hat{P}_{28})^{(5)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{28})^{(5)}$$

348

$$\frac{(b_i)^{(5)}}{(\bar{M}_{28})^{(5)}} \left[((\hat{Q}_{28})^{(5)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{28})^{(5)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{28})^{(5)} \right] \leq (\hat{Q}_{28})^{(5)}$$

349

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i into itself

350

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric

351

$$d\left((G_{31})^{(1)}, (T_{31})^{(1)}, (G_{31})^{(2)}, (T_{31})^{(2)} \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{28})^{(5)}t} \right\}$$

Indeed if we denote

Definition of $(\widetilde{G_{31}}, \widetilde{T_{31}})$: $(\widetilde{G_{31}}, \widetilde{T_{31}}) = \mathcal{A}^{(5)}((G_{31}), (T_{31}))$

It results

$$\begin{aligned} |\tilde{G}_{28}^{(1)} - \tilde{G}_i^{(2)}| &\leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\bar{M}_{28})^{(5)}s_{(28)}} e^{(\bar{M}_{28})^{(5)}s_{(28)}} ds_{(28)} + \\ &\int_0^t \{ (a'_{28})^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\bar{M}_{28})^{(5)}s_{(28)}} e^{-(\bar{M}_{28})^{(5)}s_{(28)}} + \\ &(a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\bar{M}_{28})^{(5)}s_{(28)}} e^{(\bar{M}_{28})^{(5)}s_{(28)}} + \\ &G_{28}^{(2)} | (a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a''_{28})^{(5)} (T_{29}^{(2)}, s_{(28)}) | e^{-(\bar{M}_{28})^{(5)}s_{(28)}} e^{(\bar{M}_{28})^{(5)}s_{(28)}} \} ds_{(28)} \end{aligned}$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

352

$$\begin{aligned} |(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\bar{M}_{28})^{(5)}t} &\leq \\ \frac{1}{(\bar{M}_{28})^{(5)}} &\left((a_{28})^{(5)} + (a'_{28})^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)} \right) d\left(((G_{31})^{(1)}, (T_{31})^{(1)}); (G_{31})^{(2)}, (T_{31})^{(2)} \right) \end{aligned}$$

353

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows

Remark 1: The fact that we supposed $(a''_{28})^{(5)}$ and $(b''_{28})^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ . 354

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(5)}$ and $(b''_i)^{(5)}, i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 355

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(5)} - (a''_i)^{(5)}(T_{29}(s_{(28)}), s_{(28)})\} ds_{(28)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(5)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{28})^{(5)})_1, ((\widehat{M}_{28})^{(5)})_2$ and $((\widehat{M}_{28})^{(5)})_3$: 356

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$$G_{28} < (\widehat{M}_{28})^{(5)} \text{ it follows } \frac{dG_{29}}{dt} \leq ((\widehat{M}_{28})^{(5)})_1 - (a'_{29})^{(5)}G_{29} \text{ and by integrating}$$

$$G_{29} \leq ((\widehat{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29})^{(5)}((\widehat{M}_{28})^{(5)})_1 / (a'_{29})^{(5)}$$

In the same way, one can obtain

$$G_{30} \leq ((\widehat{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30})^{(5)}((\widehat{M}_{28})^{(5)})_2 / (a'_{30})^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28} , G_{30} and G_{28} , G_{29} respectively.

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below. 357

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(5)}((G_{31})(t), t)) = (b'_{29})^{(5)}$ then $T_{29} \rightarrow \infty$. 358

Definition of $(m)^{(5)}$ and ε_5 :

Indeed let t_5 be so that for $t > t_5$

$$(b_{29})^{(5)} - (b''_i)^{(5)}((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)}$$

359

Then $\frac{dT_{29}}{dt} \geq (a_{29})^{(5)}(m)^{(5)} - \varepsilon_5 T_{29}$ which leads to 360

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_5 t} = \frac{1}{2} \text{ it results}$$

$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{2} \right), t = \log \frac{2}{\varepsilon_5}$ By taking now ε_5 sufficiently small one sees that T_{29} is unbounded. The same property holds for T_{30} if $\lim_{t \rightarrow \infty} (b''_{30})^{(5)}((G_{31})(t), t) = (b'_{30})^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$

361

It is now sufficient to take $\frac{(a_i)^{(6)}}{(M_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(M_{32})^{(6)}} < 1$ and to choose

362

$(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ large to have

$$\frac{(a_i)^{(6)}}{(M_{32})^{(6)}} \left[(\hat{P}_{32})^{(6)} + ((\hat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\hat{P}_{32})^{(6)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{32})^{(6)} \tag{363}$$

$$\frac{(b_i)^{(6)}}{(M_{32})^{(6)}} \left[((\hat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{32})^{(6)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{32})^{(6)} \right] \leq (\hat{Q}_{32})^{(6)} \tag{364}$$

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i into itself 365

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric 366

$$d\left((G_{35})^{(1)}, (T_{35})^{(1)}, (G_{35})^{(2)}, (T_{35})^{(2)} \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{32})^{(6)}t} \right\}$$

Indeed if we denote

Definition of $(\widehat{G_{35}}, \widehat{T_{35}})$: $(\widehat{G_{35}}, \widehat{T_{35}}) = \mathcal{A}^{(6)}((G_{35}), (T_{35}))$

It results

$$\begin{aligned} |\widehat{G}_{32}^{(1)} - \widehat{G}_{32}^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} ds_{(32)} + \\ &\int_0^t \{ (a'_{32})^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{-(M_{32})^{(6)}s_{(32)}} + \\ &(a''_{32})^{(6)}(T_{33}^{(1)}, s_{(32)}) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} + \\ &G_{32}^{(2)} | (a''_{32})^{(6)}(T_{33}^{(1)}, s_{(32)}) - (a''_{32})^{(6)}(T_{33}^{(2)}, s_{(32)}) | e^{-(M_{32})^{(6)}s_{(32)}} e^{(M_{32})^{(6)}s_{(32)}} \} ds_{(32)} \end{aligned}$$

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$ 367

From the hypotheses it follows

$$(1) \quad (a'_i)^{(1)}, (a''_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (b''_i)^{(1)} > 0, \\ i, j = 13, 14, 15$$

(2) The functions $(a''_i)^{(1)}, (b''_i)^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a''_i)^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b''_i)^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b'_i)^{(1)} \leq (\hat{B}_{13})^{(1)}$$

$$(3) \quad \lim_{T_2 \rightarrow \infty} (a''_i)^{(1)}(T_{14}, t) = (p_i)^{(1)} \\ \lim_{G \rightarrow \infty} (b''_i)^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants
 and $i = 13, 14, 15$

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T'_{14}, t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T'_{14} - T_{14}| e^{-(\hat{M}_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, T)| < (\hat{k}_{13})^{(1)} ||G - G'| e^{-(\hat{M}_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(1)}(T'_{14}, t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(Z) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}} , \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(AA) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

Analogous inequalities hold also for $G_{37}, G_{38}, T_{36}, T_{37}, T_{38}$

368

It is now sufficient to take $\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}}, \frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} < 7$ and to choose

$(\hat{P}_{36})^{(7)}$ and $(\hat{Q}_{36})^{(7)}$ large to have

$$\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[(\hat{P}_{36})^{(7)} + ((\hat{P}_{36})^{(7)} + G_j^0) e^{-\left(\frac{(\hat{P}_{36})^{(7)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{36})^{(7)}$$

369

$$\frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[((\hat{Q}_{36})^{(7)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{36})^{(7)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{36})^{(7)} \right] \leq (\hat{Q}_{36})^{(7)}$$

370

371

The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric

372

$$d\left(\left((G_{39})^{(1)}, (T_{39})^{(1)}\right), \left((G_{39})^{(2)}, (T_{39})^{(2)}\right)\right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{36})^{(7)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{36})^{(7)}t} \right\}$$

Indeed if we denote

Definition of $(\widehat{G_{39}}), (\widehat{T_{39}})$:

$$((\widehat{G_{39}}), (\widehat{T_{39}})) = \mathcal{A}^{(7)}((G_{39}), (T_{39}))$$

It results

$$\begin{aligned} |\widehat{G}_{36}^{(1)} - \widehat{G}_{36}^{(2)}| &\leq \int_0^t (a_{36})^{(7)} |G_{37}^{(1)} - G_{37}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}} ds_{(36)} + \\ &\int_0^t \{(a'_{36})^{(7)} |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{-(M_{36})^{(7)}s_{(36)}} + \\ &(a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}} + \\ &G_{36}^{(2)} |(a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) - (a''_{36})^{(7)} (T_{37}^{(2)}, s_{(36)})| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}}\} ds_{(36)} \end{aligned}$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

373

$$\begin{aligned} |(G_{39})^{(1)} - (G_{39})^{(2)}| e^{-(M_{36})^{(7)}t} &\leq \\ \frac{1}{(M_{36})^{(7)}} &\left((a_{36})^{(7)} + (a'_{36})^{(7)} + (\widehat{A}_{36})^{(7)} + (\widehat{P}_{36})^{(7)} (\widehat{K}_{36})^{(7)} \right) d\left(\left((G_{39})^{(1)}, (T_{39})^{(1)}\right); \left((G_{39})^{(2)}, (T_{39})^{(2)}\right)\right) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (37,35,36) the result follows

374

Remark 1: The fact that we supposed $(a''_{36})^{(7)}$ and $(b''_{36})^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t}$ and $(\widehat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t}$ respectively of \mathbb{R}_+ .

375

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(7)}$ and $(b''_i)^{(7)}$, $i = 36, 37, 38$ depend only on T_{37} and respectively on (G_{39}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

376

From 79 to 36 it results

$$\begin{aligned} G_i(t) &\geq G_i^0 e^{-\int_0^t \{(a'_i)^{(7)} - (a''_i)^{(7)}(T_{37}(s_{(36)}), s_{(36)})\} ds_{(36)}} \geq 0 \\ T_i(t) &\geq T_i^0 e^{-(b'_i)^{(7)}t} > 0 \quad \text{for } t > 0 \end{aligned}$$

Definition of $((\widehat{M}_{36})^{(7)})_1, ((\widehat{M}_{36})^{(7)})_2$ and $((\widehat{M}_{36})^{(7)})_3$:

377

Remark 3: if G_{36} is bounded, the same property have also G_{37} and G_{38} . indeed if

$G_{36} < (\widehat{M}_{36})^{(7)}$ it follows $\frac{dG_{37}}{dt} \leq ((\widehat{M}_{36})^{(7)})_1 - (a'_{37})^{(7)} G_{37}$ and by integrating

$$G_{37} \leq ((\widehat{M}_{36})^{(7)})_2 = G_{37}^0 + 2(a_{37})^{(7)} ((\widehat{M}_{36})^{(7)})_1 / (a'_{37})^{(7)}$$

In the same way, one can obtain

$$G_{38} \leq ((\overline{M}_{36})^{(7)})_3 = G_{38}^0 + 2(a_{38})^{(7)}((\overline{M}_{36})^{(7)})_2 / (a'_{38})^{(7)}$$

If G_{37} or G_{38} is bounded, the same property follows for G_{36} , G_{38} and G_{36} , G_{37} respectively.

Remark 7: If G_{36} is bounded, from below, the same property holds for G_{37} and G_{38} . The proof is analogous with the preceding one. An analogous property is true if G_{37} is bounded from below. 378

Remark 5: If T_{36} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(7)}((G_{39})(t), t)) = (b'_{37})^{(7)}$ then $T_{37} \rightarrow \infty$. 379

Definition of $(m)^{(7)}$ and ε_7 :

Indeed let t_7 be so that for $t > t_7$

$$(b_{37})^{(7)} - (b''_i)^{(7)}((G_{39})(t), t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)}(m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 380

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{\varepsilon_7} \right) (1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_7 t} = \frac{1}{2} \text{ it results}$$

$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_7}$ By taking now ε_7 sufficiently small one sees that T_{37} is unbounded. The same property holds for T_{38} if $\lim_{t \rightarrow \infty} (b''_{38})^{(7)}((G_{39})(t), t) = (b'_{38})^{(7)}$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 72

In order that the operator $\mathcal{A}^{(7)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS AND ITS CONCOMITANT CONDITIONALITIES into itself 381

The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric 383

$$d \left(((G_{39})^{(1)}, (T_{39})^{(1)}), ((G_{39})^{(2)}, (T_{39})^{(2)}) \right) = \sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\overline{M}_{36})^{(7)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\overline{M}_{36})^{(7)}t} \}$$

Indeed if we denote

Definition of $(\overline{G}_{39}), (\overline{T}_{39})$:

$$((\overline{G}_{39}), (\overline{T}_{39})) = \mathcal{A}^{(7)}((G_{39}), (T_{39}))$$

It results

$$\begin{aligned} |\overline{G}_{36}^{(1)} - \overline{G}_i^{(2)}| &\leq \int_0^t (a_{36})^{(7)} |G_{37}^{(1)} - G_{37}^{(2)}| e^{-(\overline{M}_{36})^{(7)}s_{(36)}} e^{(\overline{M}_{36})^{(7)}s_{(36)}} ds_{(36)} + \\ &\int_0^t \{ (a'_{36})^{(7)} |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\overline{M}_{36})^{(7)}s_{(36)}} e^{-(\overline{M}_{36})^{(7)}s_{(36)}} + \\ &(a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\overline{M}_{36})^{(7)}s_{(36)}} e^{(\overline{M}_{36})^{(7)}s_{(36)}} + \\ &G_{36}^{(2)} |(a''_{36})^{(7)} (T_{37}^{(1)}, s_{(36)}) - (a''_{36})^{(7)} (T_{37}^{(2)}, s_{(36)})| e^{-(\overline{M}_{36})^{(7)}s_{(36)}} e^{(\overline{M}_{36})^{(7)}s_{(36)}} \} ds_{(36)} \end{aligned}$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\left| (G_{39})^{(1)} - (G_{39})^{(2)} \right| e^{-(\widehat{M}_{36})^{(7)}t} \leq \frac{1}{(\widehat{M}_{36})^{(7)}} \left((a_{36})^{(7)} + (a'_{36})^{(7)} + (\widehat{A}_{36})^{(7)} + (\widehat{P}_{36})^{(7)} (\widehat{k}_{36})^{(7)} \right) d \left(((G_{39})^{(1)}, (T_{39})^{(1)}); (G_{39})^{(2)}, (T_{39})^{(2)} \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{36})^{(7)}$ and $(b''_{36})^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)} e^{(\widehat{M}_{36})^{(7)}t}$ and $(\widehat{Q}_{36})^{(7)} e^{(\widehat{M}_{36})^{(7)}t}$ respectively of \mathbb{R}_+ . 385

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(7)}$ and $(b''_i)^{(7)}, i = 36, 37, 38$ depend only on T_{37} and respectively on (G_{39}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 386

From CONCATENATED GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(7)} - (a''_i)^{(7)}\} (T_{37}(s_{(36)}), s_{(36)}) ds_{(36)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(7)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{36})^{(7)})_1, ((\widehat{M}_{36})^{(7)})_2$ and $((\widehat{M}_{36})^{(7)})_3$: 387

Remark 3: if G_{36} is bounded, the same property have also G_{37} and G_{38} . indeed if

$$G_{36} < (\widehat{M}_{36})^{(7)} \text{ it follows } \frac{dG_{37}}{dt} \leq ((\widehat{M}_{36})^{(7)})_1 - (a'_{37})^{(7)} G_{37} \text{ and by integrating}$$

$$G_{37} \leq ((\widehat{M}_{36})^{(7)})_2 = G_{37}^0 + 2(a_{37})^{(7)} ((\widehat{M}_{36})^{(7)})_1 / (a'_{37})^{(7)}$$

In the same way, one can obtain

$$G_{38} \leq ((\widehat{M}_{36})^{(7)})_3 = G_{38}^0 + 2(a_{38})^{(7)} ((\widehat{M}_{36})^{(7)})_2 / (a'_{38})^{(7)}$$

If G_{37} or G_{38} is bounded, the same property follows for G_{36}, G_{38} and G_{36}, G_{37} respectively.

Remark 7: If G_{36} is bounded, from below, the same property holds for G_{37} and G_{38} . The proof is analogous with the preceding one. An analogous property is true if G_{37} is bounded from below. 388

Remark 5: If T_{36} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(7)} ((G_{39})(t), t)) = (b'_{37})^{(7)}$ then $T_{37} \rightarrow \infty$. 389

Definition of $(m)^{(7)}$ and ε_7 :

Indeed let t_7 be so that for $t > t_7$

$$(b_{37})^{(7)} - (b''_i)^{(7)} ((G_{39})(t), t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)} (m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 390

$$T_{37} \geq \left(\frac{(a_{37})^{(7)} (m)^{(7)}}{\varepsilon_7} \right) (1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_7 t} = \frac{1}{2} \text{ it results}$$

$$T_{37} \geq \left(\frac{(a_{37})^{(7)} (m)^{(7)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_7} \text{ By taking now } \varepsilon_7 \text{ sufficiently small one sees that } T_{37} \text{ is unbounded. The}$$

same property holds for T_{38} if $\lim_{t \rightarrow \infty} (b_{38}'')^{(7)}((G_{39})(t), t) = (b_{38}')^{(7)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

$$-(\sigma_2)^{(2)} \leq -(a_{16}')^{(2)} + (a_{17}')^{(2)} - (a_{16}'')^{(2)}(T_{17}, t) + (a_{17}'')^{(2)}(T_{17}, t) \leq -(\sigma_1)^{(2)} \quad 391$$

$$-(\tau_2)^{(2)} \leq -(b_{16}')^{(2)} + (b_{17}')^{(2)} - (b_{16}'')^{(2)}((G_{19}), t) - (b_{17}'')^{(2)}((G_{19}), t) \leq -(\tau_1)^{(2)} \quad 392$$

Definition of $(v_1)^{(2)}, (v_2)^{(2)}, (u_1)^{(2)}, (u_2)^{(2)}$: 393

By $(v_1)^{(2)} > 0, (v_2)^{(2)} < 0$ and respectively $(u_1)^{(2)} > 0, (u_2)^{(2)} < 0$ the roots 394

(a) of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ 395

and $(b_{14})^{(2)}(u^{(2)})^2 + (\tau_1)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ and 396

Definition of $(\bar{v}_1)^{(2)}, (\bar{v}_2)^{(2)}, (\bar{u}_1)^{(2)}, (\bar{u}_2)^{(2)}$: 397

By $(\bar{v}_1)^{(2)} > 0, (\bar{v}_2)^{(2)} < 0$ and respectively $(\bar{u}_1)^{(2)} > 0, (\bar{u}_2)^{(2)} < 0$ the 398

roots of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ 399

and $(b_{17})^{(2)}(u^{(2)})^2 + (\tau_2)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ 400

Definition of $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$:- 401

(b) If we define $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$ by 402

$$(m_2)^{(2)} = (v_0)^{(2)}, (m_1)^{(2)} = (v_1)^{(2)}, \text{ if } (v_0)^{(2)} < (v_1)^{(2)} \quad 403$$

$$(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (\bar{v}_1)^{(2)}, \text{ if } (v_1)^{(2)} < (v_0)^{(2)} < (\bar{v}_1)^{(2)}, \quad 404$$

and
$$(v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0}$$

$$(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (v_0)^{(2)}, \text{ if } (\bar{v}_1)^{(2)} < (v_0)^{(2)} \quad 405$$

and analogously 406

$$(\mu_2)^{(2)} = (u_0)^{(2)}, (\mu_1)^{(2)} = (u_1)^{(2)}, \text{ if } (u_0)^{(2)} < (u_1)^{(2)}$$

$$(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (\bar{u}_1)^{(2)}, \text{ if } (u_1)^{(2)} < (u_0)^{(2)} < (\bar{u}_1)^{(2)},$$

and
$$(u_0)^{(2)} = \frac{T_{16}^0}{T_{17}^0}$$

$$(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (u_0)^{(2)}, \text{ if } (\bar{u}_1)^{(2)} < (u_0)^{(2)} \quad 407$$

Then the solution satisfies the inequalities 408

$$G_{16}^0 e^{((S_1)^{(2)} - (p_{16})^{(2)})t} \leq G_{16}(t) \leq G_{16}^0 e^{(S_1)^{(2)}t}$$

$(p_i)^{(2)}$ is defined 409

$$\frac{1}{(m_1)^{(2)}} G_{16}^0 e^{((S_1)^{(2)} - (p_{16})^{(2)})t} \leq G_{17}(t) \leq \frac{1}{(m_2)^{(2)}} G_{16}^0 e^{(S_1)^{(2)}t} \quad 410$$

$$\left(\frac{(a_{18})^{(2)} G_{16}^0}{(m_1)^{(2)} ((S_1)^{(2)} - (p_{16})^{(2)} - (S_2)^{(2)})} \right) \left[e^{((S_1)^{(2)} - (p_{16})^{(2)})t} - e^{-(S_2)^{(2)}t} \right] + G_{18}^0 e^{-(S_2)^{(2)}t} \leq G_{18}(t) \leq \quad 411$$

$$\frac{(a_{18})^{(2)}G_{16}^0}{(m_2)^{(2)}((S_1)^{(2)}-(a'_{18})^{(2)})} [e^{(S_1)^{(2)}t} - e^{-(a'_{18})^{(2)}t}] + G_{18}^0 e^{-(a'_{18})^{(2)}t}$$

$$\boxed{T_{16}^0 e^{(R_1)^{(2)}t} \leq T_{16}(t) \leq T_{16}^0 e^{((R_1)^{(2)}+(r_{16})^{(2)})t}} \quad 412$$

$$\frac{1}{(\mu_1)^{(2)}} T_{16}^0 e^{(R_1)^{(2)}t} \leq T_{16}(t) \leq \frac{1}{(\mu_2)^{(2)}} T_{16}^0 e^{((R_1)^{(2)}+(r_{16})^{(2)})t} \quad 413$$

$$\text{and } (b_{37})^{(7)}(u^{(7)})^2 + (\tau_1)^{(7)}u^{(7)} - (b_{36})^{(7)} = 0 \text{ and}$$

Definition of $(\bar{v}_1)^{(7)}, (\bar{v}_2)^{(7)}, (\bar{u}_1)^{(7)}, (\bar{u}_2)^{(7)}$: 482

By $(\bar{v}_1)^{(7)} > 0, (\bar{v}_2)^{(7)} < 0$ and respectively $(\bar{u}_1)^{(7)} > 0, (\bar{u}_2)^{(7)} < 0$ the

$$\text{roots of the equations } (a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} = 0$$

$$\text{and } (b_{37})^{(7)}(u^{(7)})^2 + (\tau_2)^{(7)}u^{(7)} - (b_{36})^{(7)} = 0$$

Definition of $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}, (v_0)^{(7)}$:-

(o) If we define $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}$ by

$$(m_2)^{(7)} = (v_0)^{(7)}, (m_1)^{(7)} = (v_1)^{(7)}, \text{ if } (v_0)^{(7)} < (v_1)^{(7)}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (\bar{v}_1)^{(7)}, \text{ if } (v_1)^{(7)} < (v_0)^{(7)} < (\bar{v}_1)^{(7)},$$

$$\text{and } \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (v_0)^{(7)}, \text{ if } (\bar{v}_1)^{(7)} < (v_0)^{(7)}$$

and analogously 483

$$(\mu_2)^{(7)} = (u_0)^{(7)}, (\mu_1)^{(7)} = (u_1)^{(7)}, \text{ if } (u_0)^{(7)} < (u_1)^{(7)}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (\bar{u}_1)^{(7)}, \text{ if } (u_1)^{(7)} < (u_0)^{(7)} < (\bar{u}_1)^{(7)},$$

$$\text{and } \boxed{(u_0)^{(7)} = \frac{T_{36}^0}{T_{37}^0}}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (u_0)^{(7)}, \text{ if } (\bar{u}_1)^{(7)} < (u_0)^{(7)} \text{ where } (u_1)^{(7)}, (\bar{u}_1)^{(7)}$$

are defined respectively

Then the solution satisfies the inequalities 484

$$G_{36}^0 e^{((s_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{36}(t) \leq G_{36}^0 e^{(s_1)^{(7)}t}$$

where $(p_i)^{(7)}$ is defined

$$\frac{1}{(m_7)^{(7)}} G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{37}(t) \leq \frac{1}{(m_2)^{(7)}} G_{36}^0 e^{(S_1)^{(7)}t}$$

(487

$$\frac{(a_{38})^{(7)} G_{36}^0}{(m_1)^{(7)}((S_1)^{(7)} - (p_{36})^{(7)} - (S_2)^{(7)})} \left[e^{((S_1)^{(7)} - (p_{36})^{(7)})t} - e^{-(S_2)^{(7)}t} \right] + G_{38}^0 e^{-(S_2)^{(7)}t} \leq G_{38}(t) \leq$$

$$\frac{(a_{38})^{(7)} G_{36}^0}{(m_2)^{(7)}((S_1)^{(7)} - (a'_{38})^{(7)})} \left[e^{(S_1)^{(7)}t} - e^{-(a'_{38})^{(7)}t} \right] + G_{38}^0 e^{-(a'_{38})^{(7)}t}$$

$$\boxed{T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{1}{(\mu_1)^{(7)}} T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq \frac{1}{(\mu_2)^{(7)}} T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{(b_{38})^{(7)} T_{36}^0}{(\mu_1)^{(7)}((R_1)^{(7)} - (b_{38})^{(7)})} \left[e^{(R_1)^{(7)}t} - e^{-(b'_{38})^{(7)}t} \right] + T_{38}^0 e^{-(b'_{38})^{(7)}t} \leq T_{38}(t) \leq$$

$$\frac{(a_{38})^{(7)} T_{36}^0}{(\mu_2)^{(7)}((R_1)^{(7)} + (r_{36})^{(7)} + (R_2)^{(7)})} \left[e^{((R_1)^{(7)} + (r_{36})^{(7)})t} - e^{-(R_2)^{(7)}t} \right] + T_{38}^0 e^{-(R_2)^{(7)}t}$$

Definition of $(S_1)^{(7)}, (S_2)^{(7)}, (R_1)^{(7)}, (R_2)^{(7)}$:- 491

Where $(S_1)^{(7)} = (a_{36})^{(7)}(m_2)^{(7)} - (a'_{36})^{(7)}$
 $(S_2)^{(7)} = (a_{38})^{(7)} - (p_{38})^{(7)}$
 $(R_1)^{(7)} = (b_{36})^{(7)}(\mu_2)^{(7)} - (b'_{36})^{(7)}$
 $(R_2)^{(7)} = (b'_{38})^{(7)} - (r_{38})^{(7)}$

From GLOBAL EQUATIONS we obtain 492

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37}, t) \right) -$$

$$(a''_{37})^{(7)}(T_{37}, t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:- $\boxed{v^{(7)} = \frac{G_{36}}{G_{37}}}$

It follows

$$- \left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} \right) \leq \frac{dv^{(7)}}{dt} \leq$$

$$- \left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

(a) For $0 < \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \geq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{-(a_{37})^{(7)}((v_1)^{(7)} - (v_0)^{(7)})t}}{1 + (C)^{(7)} e^{-(a_{37})^{(7)}((v_1)^{(7)} - (v_0)^{(7)})t}}, \quad \boxed{(C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}$$

it follows $(v_0)^{(7)} \leq v^{(7)}(t) \leq (v_1)^{(7)}$

In the same manner, we get 493

$$v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{-(a_{37})^{(7)}((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)})t}}{1 + (\bar{C})^{(7)} e^{-(a_{37})^{(7)}((\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)})t}}, \quad \boxed{(\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}$$

From which we deduce $(v_0)^{(7)} \leq v^{(7)}(t) \leq (\bar{v}_1)^{(7)}$

(b) If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{v}_1)^{(7)}$ we find like in the previous case, 494

$$(v_1)^{(7)} \leq \frac{(v_1)^{(7)} + (c)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}}{1 + (c)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}} \leq v^{(7)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(7)} + (c)^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (c)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (\bar{v}_1)^{(7)}$$

(c) If $0 < (v_1)^{(7)} \leq (\bar{v}_1)^{(7)} \leq \boxed{(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}}$, we obtain

495

$$(v_1)^{(7)} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (c)^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (c)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (v_0)^{(7)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad \boxed{v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:-

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad \boxed{u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{36})^{(7)} = (a''_{37})^{(7)}$, then $(\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(v_1)^{(7)} = (\bar{v}_1)^{(7)}$ if in addition $(v_0)^{(7)} = (v_1)^{(7)}$ then $v^{(7)}(t) = (v_0)^{(7)}$ and as a consequence $G_{36}(t) = (v_0)^{(7)}G_{37}(t)$ **this also defines $(v_0)^{(7)}$ for the special case .**

Analogously if $(b''_{36})^{(7)} = (b''_{37})^{(7)}$, then $(\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then

$(u_1)^{(7)} = (\bar{u}_1)^{(7)}$ if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(v_1)^{(7)}$ and $(\bar{v}_1)^{(7)}$, **and definition of $(u_0)^{(7)}$.**

We can prove the following

If $(a''_i)^{(7)}$ and $(b''_i)^{(7)}$ are independent on t , and the conditions

$$(a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} < 0$$

$$(a_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a_{36})^{(7)}(p_{36})^{(7)} + (a'_{37})^{(7)}(p_{37})^{(7)} + (p_{36})^{(7)}(p_{37})^{(7)} > 0$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} > 0,$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - (b'_{36})^{(7)}(r_{37})^{(7)} - (b'_{37})^{(7)}(r_{37})^{(7)} + (r_{36})^{(7)}(r_{37})^{(7)} < 0$$

with $(p_{36})^{(7)}, (r_{37})^{(7)}$ as defined are satisfied, then the system WITH THE SATISFACTION OF THE FOLLOWING PROPERTIES HAS A SOLUTION AS DERIVED BELOW.

Particular case :

If $(a''_{16})^{(2)} = (a''_{17})^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)}G_{17}(t)$

Analogously if $(b''_{16})^{(2)} = (b''_{17})^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)}T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$

From GLOBAL EQUATIONS we obtain

496
496A
496B
496C
497C
497D
497E
497F
497G

498

499

500

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a'_{20})^{(3)} - (a'_{21})^{(3)} + (a''_{20})^{(3)}(T_{21}, t) \right) - (a''_{21})^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)}$$

Definition of $v^{(3)}$:- $v^{(3)} = \frac{G_{20}}{G_{21}}$ 501

It follows

$$- \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)} \right) \leq \frac{dv^{(3)}}{dt} \leq - \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)} \right)$$
502

From which one obtains

(a) For $0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)}e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}}{1 + (C)^{(3)}e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}}$$
 $(C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$

In the same manner, we get

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}$$
 $(\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}$
503

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case, 504

$$(v_1)^{(3)} \leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)}e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}}{1 + (C)^{(3)}e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (\bar{v}_1)^{(3)}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain 505

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)}e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{20})^{(3)} = (a''_{21})^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)}G_{21}(t)$

Analogously if $(b''_{20})^{(3)} = (b''_{21})^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$

: From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25}, t) \right) - (a''_{25})^{(4)}(T_{25}, t)v^{(4)} - (a_{25})^{(4)}v^{(4)}$$

Definition of $v^{(4)}$:- $v^{(4)} = \frac{G_{24}}{G_{25}}$ 508

It follows

$$- \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_2)^{(4)}v^{(4)} - (a_{24})^{(4)} \right) \leq \frac{dv^{(4)}}{dt} \leq - \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_4)^{(4)}v^{(4)} - (a_{24})^{(4)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \boxed{(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}} < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}}{4 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}} , \quad \boxed{(C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}}$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner , we get

509

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{4 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case,

510

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}}{1 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}} \leq v^{(4)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (\bar{v}_1)^{(4)}$$

511

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \boxed{(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$, we obtain

512

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(4)}(t)$:-

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)} , \quad \boxed{v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t)$:-

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)} , \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{24}'')^{(4)} = (a_{25}'')^{(4)}$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case .**

513

Analogously if $(b_{24}'')^{(4)} = (b_{25}'')^{(4)}$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then $(u_1)^{(4)} = (\bar{u}_1)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

514

From GLOBAL EQUATIONS we obtain

515

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)}$:-
$$v^{(5)} = \frac{G_{28}}{G_{29}}$$

It follows

$$- \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)} \right) \leq \frac{dv^{(5)}}{dt} \leq - \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)}$:-

(g) For $0 < \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad \boxed{(C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner , we get

516

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{5 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}, \quad \boxed{(\bar{C})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_5)^{(5)}$

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case,

517

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}} \leq v^{(5)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (\bar{v}_1)^{(5)}$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}}$, we obtain

518

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (v_0)^{(5)}$$

519

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad \boxed{v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad \boxed{u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{28})^{(5)} = (a''_{29})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)}G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case .**

Analogously if $(b''_{28})^{(5)} = (b''_{29})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then $(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)}T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$.**

we obtain

520
521

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a'_{32})^{(6)} - (a'_{33})^{(6)} + (a''_{32})^{(6)}(T_{33}, t) \right) - (a''_{33})^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $v^{(6)} = \frac{G_{32}}{G_{33}}$

It follows

$$- \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_2)^{(6)}v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_1)^{(6)}v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

(j) For $0 < \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_0)^{(6)})t]}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_0)^{(6)})t]}} , \quad \boxed{(C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner , we get

522

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)})t]}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)})t]}} , \quad \boxed{(\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

523

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case,

524

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_2)^{(6)})t]}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_2)^{(6)})t]}} \leq v^{(6)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)})t]}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)})t]}} \leq (\bar{v}_1)^{(6)}$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}}$, we obtain

525

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{c})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} ((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}) t]}}{1 + (\bar{c})^{(6)} e^{[-(a_{33})^{(6)} ((\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}) t]}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)}, \quad \boxed{v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)}, \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{32})^{(6)} = (a''_{33})^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)} G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b''_{32})^{(6)} = (b''_{33})^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then $(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)} T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

526
527

Behavior of the solutions

If we denote and define

Definition of $(\sigma_1)^{(7)}, (\sigma_2)^{(7)}, (\tau_1)^{(7)}, (\tau_2)^{(7)}$:

(p) $(\sigma_1)^{(7)}, (\sigma_2)^{(7)}, (\tau_1)^{(7)}, (\tau_2)^{(7)}$ four constants satisfying

$$-(\sigma_2)^{(7)} \leq -(a'_{36})^{(7)} + (a'_{37})^{(7)} - (a''_{36})^{(7)}(T_{37}, t) + (a''_{37})^{(7)}(T_{37}, t) \leq -(\sigma_1)^{(7)}$$

$$-(\tau_2)^{(7)} \leq -(b'_{36})^{(7)} + (b'_{37})^{(7)} - (b''_{36})^{(7)}((G_{39}), t) - (b''_{37})^{(7)}((G_{39}), t) \leq -(\tau_1)^{(7)}$$

Definition of $(v_1)^{(7)}, (v_2)^{(7)}, (u_1)^{(7)}, (u_2)^{(7)}, v^{(7)}, u^{(7)}$:

(q) By $(v_1)^{(7)} > 0, (v_2)^{(7)} < 0$ and respectively $(u_1)^{(7)} > 0, (u_2)^{(7)} < 0$ the roots of the equations

$$(a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)} = 0$$

$$\text{and } (b_{37})^{(7)}(u^{(7)})^2 + (\tau_1)^{(7)}u^{(7)} - (b_{36})^{(7)} = 0 \text{ and}$$

Definition of $(\bar{v}_1)^{(7)}, (\bar{v}_2)^{(7)}, (\bar{u}_1)^{(7)}, (\bar{u}_2)^{(7)}$:

By $(\bar{v}_1)^{(7)} > 0, (\bar{v}_2)^{(7)} < 0$ and respectively $(\bar{u}_1)^{(7)} > 0, (\bar{u}_2)^{(7)} < 0$ the

$$\text{roots of the equations } (a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} = 0$$

$$\text{and } (b_{37})^{(7)}(u^{(7)})^2 + (\tau_2)^{(7)}u^{(7)} - (b_{36})^{(7)} = 0$$

Definition of $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}, (v_0)^{(7)}$:-

(r) If we define $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}$ by

528

529

530.

$$(m_2)^{(7)} = (v_0)^{(7)}, (m_1)^{(7)} = (v_1)^{(7)}, \text{ if } (v_0)^{(7)} < (v_1)^{(7)}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (\bar{v}_1)^{(7)}, \text{ if } (v_1)^{(7)} < (v_0)^{(7)} < (\bar{v}_1)^{(7)},$$

and
$$(v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (v_0)^{(7)}, \text{ if } (\bar{v}_1)^{(7)} < (v_0)^{(7)}$$

and analogously

531

$$(\mu_2)^{(7)} = (u_0)^{(7)}, (\mu_1)^{(7)} = (u_1)^{(7)}, \text{ if } (u_0)^{(7)} < (u_1)^{(7)}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (\bar{u}_1)^{(7)}, \text{ if } (u_1)^{(7)} < (u_0)^{(7)} < (\bar{u}_1)^{(7)},$$

and
$$(u_0)^{(7)} = \frac{T_{36}^0}{T_{37}^0}$$

$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (u_0)^{(7)}, \text{ if } (\bar{u}_1)^{(7)} < (u_0)^{(7)}$ where $(u_1)^{(7)}, (\bar{u}_1)^{(7)}$ are defined by 59 and 67 respectively

Then the solution of GLOBAL EQUATIONS satisfies the inequalities

532

$$G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{36}(t) \leq G_{36}^0 e^{(S_1)^{(7)}t}$$

where $(p_i)^{(7)}$ is defined

$$\frac{1}{(m_7)^{(7)}} G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{37}(t) \leq \frac{1}{(m_2)^{(7)}} G_{36}^0 e^{(S_1)^{(7)}t}$$

533

$$\left(\frac{(a_{38})^{(7)} G_{36}^0}{(m_1)^{(7)} ((S_1)^{(7)} - (p_{36})^{(7)} - (S_2)^{(7)})} \left[e^{((S_1)^{(7)} - (p_{36})^{(7)})t} - e^{-(S_2)^{(7)}t} \right] + G_{38}^0 e^{-(S_2)^{(7)}t} \leq G_{38}(t) \leq \frac{(a_{38})^{(7)} G_{36}^0}{(m_2)^{(7)} ((S_1)^{(7)} - (a_{38})^{(7)})} \left[e^{(S_1)^{(7)}t} - e^{-(a_{38})^{(7)}t} \right] + G_{38}^0 e^{-(a_{38})^{(7)}t} \right)$$

534

$$\boxed{T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

535

$$\frac{1}{(\mu_1)^{(7)}} T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq \frac{1}{(\mu_2)^{(7)}} T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

536

$$\frac{(b_{38})^{(7)} T_{36}^0}{(\mu_1)^{(7)} ((R_1)^{(7)} - (b_{38})^{(7)})} \left[e^{(R_1)^{(7)}t} - e^{-(b_{38})^{(7)}t} \right] + T_{38}^0 e^{-(b_{38})^{(7)}t} \leq T_{38}(t) \leq \frac{(a_{38})^{(7)} T_{36}^0}{(\mu_2)^{(7)} ((R_1)^{(7)} + (r_{36})^{(7)} + (R_2)^{(7)})} \left[e^{((R_1)^{(7)} + (r_{36})^{(7)})t} - e^{-(R_2)^{(7)}t} \right] + T_{38}^0 e^{-(R_2)^{(7)}t}$$

537

Definition of $(S_1)^{(7)}, (S_2)^{(7)}, (R_1)^{(7)}, (R_2)^{(7)}$:-

538

Where $(S_1)^{(7)} = (a_{36})^{(7)}(m_2)^{(7)} - (a_{36})^{(7)}$

$$(S_2)^{(7)} = (a_{38})^{(7)} - (p_{38})^{(7)}$$

$$(R_1)^{(7)} = (b_{36})^{(7)}(\mu_2)^{(7)} - (b_{36})^{(7)}$$

$$(R_2)^{(7)} = (b_{38})^{(7)} - (r_{38})^{(7)}$$

539

From CONCATENATED GLOBAL EQUATIONS we obtain

540

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a_{36}')^{(7)} - (a_{37}')^{(7)} + (a_{36}'')^{(7)}(T_{37}, t) \right) - (a_{37}'')^{(7)}(T_{37}, t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:-
$$v^{(7)} = \frac{G_{36}}{G_{37}}$$

It follows

$$-\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)}\right) \leq \frac{dv^{(7)}}{dt} \leq -\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

(m) For $0 < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \geq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}, \quad (C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}$$

it follows $(v_0)^{(7)} \leq v^{(7)}(t) \leq (v_1)^{(7)}$

In the same manner , we get

$$v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}, \quad (\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}$$

541

From which we deduce $(v_0)^{(7)} \leq v^{(7)}(t) \leq (\bar{v}_1)^{(7)}$

(n) If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{v}_1)^{(7)}$ we find like in the previous case,

542

$$(v_1)^{(7)} \leq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (\bar{v}_1)^{(7)}$$

(o) If $0 < (v_1)^{(7)} \leq (\bar{v}_1)^{(7)} \leq (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}$, we obtain

543

$$(v_1)^{(7)} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (v_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:-

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}$$

Now, using this result and replacing it in CONCATENATED GLOBAL EQUATIONS we get easily the result

stated in the theorem.

Particular case :

If $(a_{36}''^{(7)} = (a_{37}''^{(7)})$, then $(\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(v_1)^{(7)} = (\bar{v}_1)^{(7)}$ if in addition $(v_0)^{(7)} = (v_1)^{(7)}$ then $v^{(7)}(t) = (v_0)^{(7)}$ and as a consequence $G_{36}(t) = (v_0)^{(7)}G_{37}(t)$ **this also defines $(v_0)^{(7)}$ for the special case .**

Analogously if $(b_{36}''^{(7)} = (b_{37}''^{(7)})$, then $(\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then $(u_1)^{(7)} = (\bar{u}_1)^{(7)}$ if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(v_1)^{(7)}$ and $(\bar{v}_1)^{(7)}$, **and definition of $(u_0)^{(7)}$.**

$$(b_{14})^{(1)}T_{13} - [(b'_{14})^{(1)} - (b''_{14})^{(1)}(G)]T_{14} = 0 \tag{544}$$

$$(b_{15})^{(1)}T_{14} - [(b'_{15})^{(1)} - (b''_{15})^{(1)}(G)]T_{15} = 0 \tag{545}$$

has a unique positive solution , which is an equilibrium solution for the system 546

$$(b_{38})^{(7)}T_{37} - [(b'_{38})^{(7)} - (b''_{38})^{(7)}(G_{39})]T_{38} = 0 \quad 589$$

has a unique positive solution , which is an equilibrium solution for the system 560

(a) Indeed the first two equations have a nontrivial solution G_{36}, G_{37} if

$$F(T_{39}) = (a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a'_{36})^{(7)}(a''_{37})^{(7)}(T_{37}) + (a'_{37})^{(7)}(a''_{36})^{(7)}(T_{37}) + (a''_{36})^{(7)}(T_{37})(a''_{37})^{(7)}(T_{37}) = 0$$

Definition and uniqueness of T_{37}^* :- 561

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a''_i)^{(7)}(T_{37})$ being increasing, it follows that there exists a unique T_{37}^* for which $f(T_{37}^*) = 0$. With this value , we obtain from the three first equations

$$G_{36} = \frac{(a_{36})^{(7)}G_{37}}{[(a'_{36})^{(7)} + (a''_{36})^{(7)}(T_{37}^*)]} \quad , \quad G_{38} = \frac{(a_{38})^{(7)}G_{37}}{[(a'_{38})^{(7)} + (a''_{38})^{(7)}(T_{37}^*)]}$$

(e) By the same argument, the equations(SOLUTIONAL) admit solutions G_{36}, G_{37} if

$$\varphi(G_{39}) = (b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - [(b'_{36})^{(7)}(b''_{37})^{(7)}(G_{39}) + (b'_{37})^{(7)}(b''_{36})^{(7)}(G_{39})] + (b''_{36})^{(7)}(G_{39})(b''_{37})^{(7)}(G_{39}) = 0$$

Where in $(G_{39})(G_{36}, G_{37}, G_{38}), G_{36}, G_{38}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{37} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{37}^* such that $\varphi(G^*) = 0$ 562

Finally we obtain the unique solution OF THE SYSTEM

G_{37}^* given by $\varphi((G_{39})^*) = 0, T_{37}^*$ given by $f(T_{37}^*) = 0$ and

$$G_{36}^* = \frac{(a_{36})^{(7)} G_{37}^*}{[(a'_{36})^{(7)} + (a''_{36})^{(7)}(T_{37}^*)]} \quad , \quad G_{38}^* = \frac{(a_{38})^{(7)} G_{37}^*}{[(a'_{38})^{(7)} + (a''_{38})^{(7)}(T_{37}^*)]}$$

$$T_{36}^* = \frac{(b_{36})^{(7)} T_{37}^*}{[(b'_{36})^{(7)} - (b''_{36})^{(7)}((G_{39})^*)]} \quad , \quad T_{38}^* = \frac{(b_{38})^{(7)} T_{37}^*}{[(b'_{38})^{(7)} - (b''_{38})^{(7)}((G_{39})^*)]} \quad \text{563}$$

Definition and uniqueness of T_{21}^* :- 564

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(1)}(T_{21})$ being increasing, it follows that there exists a unique T_{21}^* for which $f(T_{21}^*) = 0$. With this value, we obtain from the three first equations

$$G_{20} = \frac{(a_{20})^{(3)} G_{21}}{[(a'_{20})^{(3)} + (a''_{20})^{(3)}(T_{21}^*)]} \quad , \quad G_{22} = \frac{(a_{22})^{(3)} G_{21}}{[(a'_{22})^{(3)} + (a''_{22})^{(3)}(T_{21}^*)]} \quad \text{565}$$

Definition and uniqueness of T_{25}^* :- 566

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(4)}(T_{25})$ being increasing, it follows that there exists a unique T_{25}^* for which $f(T_{25}^*) = 0$. With this value, we obtain from the three first equations

$$G_{24} = \frac{(a_{24})^{(4)} G_{25}}{[(a'_{24})^{(4)} + (a''_{24})^{(4)}(T_{25}^*)]} \quad , \quad G_{26} = \frac{(a_{26})^{(4)} G_{25}}{[(a'_{26})^{(4)} + (a''_{26})^{(4)}(T_{25}^*)]}$$

Definition and uniqueness of T_{29}^* :- 567

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(5)}(T_{29})$ being increasing, it follows that there exists a unique T_{29}^* for which $f(T_{29}^*) = 0$. With this value, we obtain from the three first equations

$$G_{28} = \frac{(a_{28})^{(5)} G_{29}}{[(a'_{28})^{(5)} + (a''_{28})^{(5)}(T_{29}^*)]} \quad , \quad G_{30} = \frac{(a_{30})^{(5)} G_{29}}{[(a'_{30})^{(5)} + (a''_{30})^{(5)}(T_{29}^*)]}$$

Definition and uniqueness of T_{33}^* :- 568

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(6)}(T_{33})$ being increasing, it follows that there exists a unique T_{33}^* for which $f(T_{33}^*) = 0$. With this value, we obtain from the three first equations

$$G_{32} = \frac{(a_{32})^{(6)} G_{33}}{[(a'_{32})^{(6)} + (a''_{32})^{(6)}(T_{33}^*)]} \quad , \quad G_{34} = \frac{(a_{34})^{(6)} G_{33}}{[(a'_{34})^{(6)} + (a''_{34})^{(6)}(T_{33}^*)]}$$

(f) By the same argument, the equations 92,93 admit solutions G_{13}, G_{14} if 569

$$\varphi(G) = (b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} -$$

$$[(b'_{13})^{(1)}(b''_{14})^{(1)}(G) + (b'_{14})^{(1)}(b''_{13})^{(1)}(G)] + (b''_{13})^{(1)}(G)(b''_{14})^{(1)}(G) = 0$$

Where in $G(G_{13}, G_{14}, G_{15}), G_{13}, G_{15}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{14} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi(G^*) = 0$

(g) By the same argument, the equations 92,93 admit solutions G_{16}, G_{17} if 570

$$\varphi(G_{19}) = (b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} -$$

$$[(b'_{16})^{(2)}(b''_{17})^{(2)}(G_{19}) + (b'_{17})^{(2)}(b''_{16})^{(2)}(G_{19})] + (b''_{16})^{(2)}(G_{19})(b''_{17})^{(2)}(G_{19}) = 0$$

Where in $(G_{19})(G_{16}, G_{17}, G_{18}), G_{16}, G_{18}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{17} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi((G_{19})^*) = 0$ 571

(a) By the same argument, the concatenated equations admit solutions G_{20}, G_{21} if 572

$$\varphi(G_{23}) = (b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} -$$

$$[(b'_{20})^{(3)}(b''_{21})^{(3)}(G_{23}) + (b'_{21})^{(3)}(b''_{20})^{(3)}(G_{23})] + (b''_{20})^{(3)}(G_{23})(b''_{21})^{(3)}(G_{23}) = 0$$

Where in $G_{23}(G_{20}, G_{21}, G_{22}), G_{20}, G_{22}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{21} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{21}^* such that $\varphi((G_{23})^*) = 0$ 573

(b) By the same argument, the equations of modules admit solutions G_{24}, G_{25} if 574

$$\varphi(G_{27}) = (b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} -$$

$$[(b'_{24})^{(4)}(b''_{25})^{(4)}(G_{27}) + (b'_{25})^{(4)}(b''_{24})^{(4)}(G_{27})] + (b''_{24})^{(4)}(G_{27})(b''_{25})^{(4)}(G_{27}) = 0$$

Where in $(G_{27})(G_{24}, G_{25}, G_{26}), G_{24}, G_{26}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{25} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{25}^* such that $\varphi((G_{27})^*) = 0$

(c) By the same argument, the equations (modules) admit solutions G_{28}, G_{29} if 575

$$\varphi(G_{31}) = (b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} -$$

$$[(b'_{28})^{(5)}(b''_{29})^{(5)}(G_{31}) + (b'_{29})^{(5)}(b''_{28})^{(5)}(G_{31})] + (b''_{28})^{(5)}(G_{31})(b''_{29})^{(5)}(G_{31}) = 0$$

Where in $(G_{31})(G_{28}, G_{29}, G_{30}), G_{28}, G_{30}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{29} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{29}^* such that $\varphi((G_{31})^*) = 0$

(d) By the same argument, the equations (modules) admit solutions G_{32}, G_{33} if 578

$$\varphi(G_{35}) = (b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} -$$

$$[(b'_{32})^{(6)}(b''_{33})^{(6)}(G_{35}) + (b'_{33})^{(6)}(b''_{32})^{(6)}(G_{35})] + (b''_{32})^{(6)}(G_{35})(b''_{33})^{(6)}(G_{35}) = 0$$

Where in $(G_{35})(G_{32}, G_{33}, G_{34}), G_{32}, G_{34}$ must be replaced by their values It is easy to see that φ is a decreasing function in G_{33} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{33}^* such that $\varphi(G^*) = 0$ 581

Finally we obtain the unique solution of 89 to 94 582

G_{14}^* given by $\varphi(G^*) = 0, T_{14}^*$ given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)}G_{14}^*}{[(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14}^*)]} , G_{15}^* = \frac{(a_{15})^{(1)}G_{14}^*}{[(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14}^*)]}$$

$$T_{13}^* = \frac{(b_{13})^{(1)}T_{14}^*}{[(b'_{13})^{(1)} - (b''_{13})^{(1)}(G^*)]} , T_{15}^* = \frac{(b_{15})^{(1)}T_{14}^*}{[(b'_{15})^{(1)} - (b''_{15})^{(1)}(G^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{17}^* given by $\varphi((G_{19})^*) = 0$, T_{17}^* given by $f(T_{17}^*) = 0$ and

$$G_{16}^* = \frac{(a_{16})^{(2)}G_{17}^*}{[(a'_{16})^{(2)}+(a''_{16})^{(2)}(T_{17}^*)]} , G_{18}^* = \frac{(a_{18})^{(2)}G_{17}^*}{[(a'_{18})^{(2)}+(a''_{18})^{(2)}(T_{17}^*)]}$$

$$T_{16}^* = \frac{(b_{16})^{(2)}T_{17}^*}{[(b'_{16})^{(2)}-(b''_{16})^{(2)}((G_{19})^*)]} , T_{18}^* = \frac{(b_{18})^{(2)}T_{17}^*}{[(b'_{18})^{(2)}-(b''_{18})^{(2)}((G_{19})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{21}^* given by $\varphi((G_{23})^*) = 0$, T_{21}^* given by $f(T_{21}^*) = 0$ and

$$G_{20}^* = \frac{(a_{20})^{(3)}G_{21}^*}{[(a'_{20})^{(3)}+(a''_{20})^{(3)}(T_{21}^*)]} , G_{22}^* = \frac{(a_{22})^{(3)}G_{21}^*}{[(a'_{22})^{(3)}+(a''_{22})^{(3)}(T_{21}^*)]}$$

$$T_{20}^* = \frac{(b_{20})^{(3)}T_{21}^*}{[(b'_{20})^{(3)}-(b''_{20})^{(3)}(G_{23}^*)]} , T_{22}^* = \frac{(b_{22})^{(3)}T_{21}^*}{[(b'_{22})^{(3)}-(b''_{22})^{(3)}(G_{23}^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{25}^* given by $\varphi(G_{27}) = 0$, T_{25}^* given by $f(T_{25}^*) = 0$ and

$$G_{24}^* = \frac{(a_{24})^{(4)}G_{25}^*}{[(a'_{24})^{(4)}+(a''_{24})^{(4)}(T_{25}^*)]} , G_{26}^* = \frac{(a_{26})^{(4)}G_{25}^*}{[(a'_{26})^{(4)}+(a''_{26})^{(4)}(T_{25}^*)]}$$

$$T_{24}^* = \frac{(b_{24})^{(4)}T_{25}^*}{[(b'_{24})^{(4)}-(b''_{24})^{(4)}((G_{27})^*)]} , T_{26}^* = \frac{(b_{26})^{(4)}T_{25}^*}{[(b'_{26})^{(4)}-(b''_{26})^{(4)}((G_{27})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{29}^* given by $\varphi((G_{31})^*) = 0$, T_{29}^* given by $f(T_{29}^*) = 0$ and

$$G_{28}^* = \frac{(a_{28})^{(5)}G_{29}^*}{[(a'_{28})^{(5)}+(a''_{28})^{(5)}(T_{29}^*)]} , G_{30}^* = \frac{(a_{30})^{(5)}G_{29}^*}{[(a'_{30})^{(5)}+(a''_{30})^{(5)}(T_{29}^*)]}$$

$$T_{28}^* = \frac{(b_{28})^{(5)}T_{29}^*}{[(b'_{28})^{(5)}-(b''_{28})^{(5)}((G_{31})^*)]} , T_{30}^* = \frac{(b_{30})^{(5)}T_{29}^*}{[(b'_{30})^{(5)}-(b''_{30})^{(5)}((G_{31})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{33}^* given by $\varphi((G_{35})^*) = 0$, T_{33}^* given by $f(T_{33}^*) = 0$ and

$$G_{32}^* = \frac{(a_{32})^{(6)}G_{33}^*}{[(a'_{32})^{(6)}+(a''_{32})^{(6)}(T_{33}^*)]} , G_{34}^* = \frac{(a_{34})^{(6)}G_{33}^*}{[(a'_{34})^{(6)}+(a''_{34})^{(6)}(T_{33}^*)]}$$

$$T_{32}^* = \frac{(b_{32})^{(6)}T_{33}^*}{[(b'_{32})^{(6)}-(b''_{32})^{(6)}((G_{35})^*)]} , T_{34}^* = \frac{(b_{34})^{(6)}T_{33}^*}{[(b'_{34})^{(6)}-(b''_{34})^{(6)}((G_{35})^*)]}$$

Obviously, these values represent an equilibrium solution

ASYMPTOTIC STABILITY ANALYSIS

595

Theorem 4: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ Belong to $C^{(1)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + G_i \quad , \quad T_i = T_i^* + T_i \tag{596}$$

$$\frac{\partial (a_{14}'')^{(1)}}{\partial T_{14}}(T_{14}^*) = (q_{14})^{(1)} \quad , \quad \frac{\partial (b_i'')^{(1)}}{\partial G_j}(G^*) = s_{ij}$$

Then taking into account equations (global) and neglecting the terms of power 2, we obtain 597

$$\frac{dG_{13}}{dt} = -((a'_{13})^{(1)} + (p_{13})^{(1)})G_{13} + (a_{13})^{(1)}G_{14} - (q_{13})^{(1)}G_{13}^*T_{14} \tag{598}$$

$$\frac{dG_{14}}{dt} = -((a'_{14})^{(1)} + (p_{14})^{(1)})G_{14} + (a_{14})^{(1)}G_{13} - (q_{14})^{(1)}G_{14}^*T_{14} \tag{599}$$

$$\frac{dG_{15}}{dt} = -((a'_{15})^{(1)} + (p_{15})^{(1)})G_{15} + (a_{15})^{(1)}G_{14} - (q_{15})^{(1)}G_{15}^*T_{14} \tag{600}$$

$$\frac{dT_{13}}{dt} = -((b'_{13})^{(1)} - (r_{13})^{(1)})T_{13} + (b_{13})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(13)(j)})T_{13}^*G_j \tag{601}$$

$$\frac{dT_{14}}{dt} = -((b'_{14})^{(1)} - (r_{14})^{(1)})T_{14} + (b_{14})^{(1)}T_{13} + \sum_{j=13}^{15} (s_{(14)(j)})T_{14}^*G_j \tag{602}$$

$$\frac{dT_{15}}{dt} = -((b'_{15})^{(1)} - (r_{15})^{(1)})T_{15} + (b_{15})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(15)(j)})T_{15}^*G_j \tag{603}$$

If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ Belong to $C^{(2)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable 604

Denote 605

Definition of G_i, T_i :-

- 13)^ Note that the relativistic mass, in contrast to the rest mass m_0 , is not a relativistic invariant, and that the velocity is not a Minkowski four-vector, in contrast to the quantity dx^μ , where dx^μ is the differential of the proper time. However, the energy-momentum four-vector is a genuine Minkowski four-vector, and the intrinsic origin of the square-root in the definition of the relativistic mass is the distinction between $d\tau$ and dt .

- 26)^ There is usually more than one possible way to define a field energy, because any field can be made to couple to gravity in many different ways. By general scaling arguments, the correct answer at everyday distances, which are long compared to the quantum gravity scale, should be minimal coupling, which means that no powers of the curvature tensor appear. Any non-minimal couplings, along with other higher order terms, are presumably only determined by a theory of quantum gravity, and within string theory, they only start to contribute to experiments at the string scale.

Abstract: In quantum physics, in order to quantize a gauge theory, like for example Yang-Mills theory, Chern-Simons or BF model, one method is to perform a gauge fixing. This is done in the BRST and Batalin-Vilkovisky formulation. Another is to factor out the symmetry by dispensing with vector potentials altogether (they're not physically observable anyway) and work directly with Wilson loops, Wilson lines contracted with other charged fields at its endpoints and spin networks Presently renormalization prescriptions of the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix have been investigated by many authors like Yong Zhou. Based on one prescription which is formulated by comparing with the fictitious case of no mixing of quark generations, they have proposed the substantive limits, singular pauses, general rests, logical attributes and real relations therefore a new prescription intermodal manifestation which can make the physical amplitude involving quark's mixing gauge independent and ultraviolet finite. Compared with the previous prescriptions this prescription is very simple and suitable for actual calculations. Through analytical calculations we also give a strong Proof for the important hypothesis that in order to keep the CKM matrix gauge independent the unitarity of the CKM matrix must be preserved. Mass-shell renormalization of fermion mixing matrices have also been delineated and investigated upon by K.-P.O Diener, B.A Kniehl wherein they consider favorable extensions of the standard model (SM) where the lepton sector contains Majorana neutrinos with vanishing left-handed mass terms, thus allowing for the see-saw mechanism to operate, and propose physical on-mass-shell (OS) renormalization conditions for the lepton mixing matrices that comply with ultraviolet finiteness, gauge-parameter independence, and (pseudo)unitarity This is an important result that motivated us to draw up the consolidation of some of the most important variables in Fermion and graviton vertices.. A crucial feature is that the texture zero in the neutrino mass matrix is preserved by renormalization, which is not automatically the case for possible generalizations of existing renormalization prescriptions for the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix in the SM. Our renormalization prescription also applies to the special case of the SM and leads to a physical OS definition of the renormalized CKM matrix. A consummate and link model is built for the variables like gravity, matter field, virtual photons and other important variables. Nevertheless the stormy petrel Neutrino seems to rule the roost with its own disnormative prescriptions for itself. Rich IN ITS twists and turns, the Model seems to offer a parade of variables bent on aggrandizement agenda.

I. Introduction:

Ward-Takahashi identity

In quantum field theory, a Ward-Takahashi identity is an identity between correlation functions that follows from the global or gauged symmetries of the theory, and which remains valid after renormalization.

The Ward-Takahashi identity of quantum electrodynamics was originally used by John Clive Ward and Yasushi Takahashi to relate the wave function renormalization of the electron to its vertex renormalization factor $F_1(0)$, guaranteeing the cancellation of the ultraviolet divergence to all orders of perturbation theory. Later uses include the extension of the proof of Goldstone's theorem to all orders of perturbation theory.

The Ward-Takahashi identity is a quantum version of the classical Noether's theorem, and any symmetry in a quantum field theory can lead to an equation of motion for correlation functions..

The Ward-Takahashi identity applies to correlation functions in momentum space, which do not necessarily have all their external momenta on-shell. Let

$$\mathcal{M}(k; p_1 \cdots p_n; q_1 \cdots q_n) = \epsilon_\mu(k) \mathcal{M}^\mu(k; p_1 \cdots p_n; q_1 \cdots q_n)$$

be a QED correlation function involving an external photon with momentum k (where $\epsilon_\mu(k)$ is the polarization vector of the photon), n initial-state electrons with momenta $p_1 \cdots p_n$, and n final-state electrons with momenta $q_1 \cdots q_n$.

Also define \mathcal{M}_0 to be the simpler amplitude that is **obtained by removing** the photon with momentum k from original amplitude. Then the Ward-Takahashi identity reads

$$k_\mu \mathcal{M}^\mu(k; p_1 \cdots p_n; q_1 \cdots q_n) = -e \sum_i [\mathcal{M}_0(p_1 \cdots p_n; q_1 \cdots (q_i - k) \cdots q_n) - \mathcal{M}_0(p_1 \cdots (p_i + k) \cdots p_n; q_1 \cdots q_n)]$$

where $-e$ is the charge of the electron. Note that if \mathcal{M} has its external electrons on-shell, then the amplitudes on the right-hand side of this identity each had one external particle off-shell, and therefore they do not contribute to S-matrix elements.

The Ward identity

The Ward identity is a specialization of the Ward-Takahashi identity to S-matrix elements, which describe physically possible scattering processes and thus have all their external particles on-shell. Again let $\mathcal{M}(k) = \epsilon_\mu(k) \mathcal{M}^\mu(k)$

be the amplitude for some QED process involving an external photon with momentum k , where $\epsilon_\mu(k)$ is the polarization vector of the photon. Then the Ward identity reads:

$$k_\mu \mathcal{M}^\mu(k) = 0$$

Physically, what this identity means is the longitudinal polarization of the photon which arises in the ξ gauge is unphysical and disappears from the S-matrix.

II. Some Reviews:

Flavor Changing Fermion-Graviton Vertices (SEE FOR DETAILS G. Degrassi, E. Gabrielli, L. Trentadue-emphasis mine) Authors study the flavor-changing quark-graviton vertex that is induced at the one-loop level when gravitational interactions are coupled to the standard model. Because of the conservation of the energy-momentum tensor the corresponding form factors turn out to be finite and gauge-invariant. Analytical expressions of the form factors are provided at leading order in the external masses. Authors show that flavor-changing interactions in gravity are local if the graviton is strictly massless while if the graviton has a small mass long-range interactions inducing a flavor-changing contribution in the Newton potential appear. Flavor-changing processes with massive spin-2 particles are also briefly discussed in the paper. . These results can be generalized to the case of the lepton-graviton coupling.

Examples of its use include constraining the tensor structure of the vacuum polarization and of the electron vertex function in QED. Gauge dependence of the on-shell renormalized mixing matrices WAS STUDIED BY Youichi Yamada It was recently pointed out that the on-shell renormalization of the CabibboKobayashi-Maskawa (CKM) matrix in the method by Denner and Sack causes a gauge parameter dependence of the amplitudes. Authors analyze the gauge dependence of the on-shell renormalization of the mixing matrices both for fermions and scalars in general cases, at the one-loop level. It is also shown that this gauge dependence can be avoided by fixing the counterterm for the mixing matrices in terms of the off-diagonal wave function corrections for fermions and scalars after a rearrangement, in a similar manner to the pinch technique for gauge bosons. Particles in the same representation under unbroken symmetries can mix with each other. The neutral gauge bosons, quarks, and massive neutrinos in the Standard Model (SM) are well-known examples. New particles in extensions of the Standard Model also show the mixings. For example, in the minimal supersymmetric (SUSY) standard model (MSSM), a very promising extension, super partners of most SM particles show the mixing .The mixing of particles is expressed in terms of the mixing matrix, which represents the relations between the gauge eigenstates and the mass eigenstates of the particles. The mixing matrices always appear at the couplings of these particles in the mass eigenbasis. Because of the fact that mass eigenstates at the tree-level mix with each other by radiative corrections, (it calls for) the mixing matrices have to be renormalized to obtain ultraviolet (UV) finite amplitudes. Denner and Sack have proposed a simple scheme to renormalize the mixing matrix of Dirac fermions at the one-loop level, which is usually called the on-shell renormalization scheme. They have required the counterterm for the renormalized mixing matrix to completely absorb the anti-Hermitian part of the wave function correction δZ_{ij} for the external on-shell fields*

Where we suppose

(A) $(a_i)^{(1)}, (a'_i)^{(1)}, (a''_i)^{(1)}, (b_i)^{(1)}, (b'_i)^{(1)}, (b''_i)^{(1)} > 0,$

$i, j = 13, 14, 15$

(B) The functions $(a_i'')^{(1)}, (b_i'')^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a_i'')^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}$$

(C) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)}$

$$\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants and $i = 13, 14, 15$

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T_{14}', t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T_{14}' - T_{14}| e^{-(M_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, T)| < (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(M_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(1)}(T_{14}', t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T_{14}', t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(M_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(M_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{dT_{38}}{dt} = (b_{38})^{(7)}T_{37} - \left[(b_{38})^{(7)} - \frac{(b_{38})^{(7)}((G_{39}), t)}{b26''7G27,t} - \frac{(b_{18})^{(7)}((G_{19}), t)}{-b30''7G31,t} - \frac{(b_{20})^{(7)}((G_{14}), t)}{-b34''7G35,t} \right] - \quad \begin{matrix} 128 \\ 129 \\ 130 \\ 131 \\ 132 \end{matrix}$$

$$+ (a_{36})^{(7)}(T_{37}, t) = \text{First augmentation factor} \quad 134$$

$$(1)(a_i)^{(2)}, (a_i')^{(2)}, (a_i'')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (b_i'')^{(2)} > 0, \quad i, j = 16, 17, 18 \quad 135$$

(F) (2) The functions $(a_i'')^{(2)}, (b_i'')^{(2)}$ are positive continuous increasing and bounded. 136

Definition of $(p_i)^{(2)}, (r_i)^{(2)}$: 137

$$(a_i'')^{(2)}(T_{17}, t) \leq (p_i)^{(2)} \leq (\hat{A}_{16})^{(2)} \quad 138$$

$$(b_i'')^{(2)}(G_{19}, t) \leq (r_i)^{(2)} \leq (b_i')^{(2)} \leq (\hat{B}_{16})^{(2)} \quad 139$$

(G) (3) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(2)}(T_{17}, t) = (p_i)^{(2)}$ 140

$$\lim_{G \rightarrow \infty} (b_i'')^{(2)}((G_{19}), t) = (r_i)^{(2)} \tag{141}$$

Definition of $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}$: 142

Where $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}$ are positive constants and $i = 16, 17, 18$

They satisfy Lipschitz condition: 143

$$|(a_i'')^{(2)}(T_{17}', t) - (a_i'')^{(2)}(T_{17}, t)| \leq (\hat{k}_{16})^{(2)} |T_{17}' - T_{17}| e^{-(M_{16})^{(2)}t} \tag{144}$$

$$|(b_i'')^{(2)}((G_{19})', t) - (b_i'')^{(2)}((G_{19}), t)| < (\hat{k}_{16})^{(2)} |(G_{19})' - (G_{19})| e^{-(M_{16})^{(2)}t} \tag{145}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(2)}(T_{17}', t)$ and $(a_i'')^{(2)}(T_{17}, t)$ 146

(T_{17}', t) and (T_{17}, t) are points belonging to the interval $[(\hat{k}_{16})^{(2)}, (\hat{M}_{16})^{(2)}]$. It is to be noted that $(a_i'')^{(2)}(T_{17}, t)$

is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{16})^{(2)} = 1$ then the function $(a_i'')^{(2)}(T_{17}, t)$, the SECOND augmentation coefficient would be absolutely continuous.

Definition of $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$: 147

(H) (4) $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$, are positive constants 148

$$\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1$$

Definition of $(\hat{P}_{13})^{(2)}, (\hat{Q}_{13})^{(2)}$: 149

There exists two constants $(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ which together with $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}, (\hat{A}_{16})^{(2)}$ and $(\hat{B}_{16})^{(2)}$

and the constants $(a_i)^{(2)}, (a_i')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}, i = 16, 17, 18$,

satisfy the inequalities

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(a_i)^{(2)} + (a_i')^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \tag{150}$$

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(b_i)^{(2)} + (b_i')^{(2)} + (\hat{B}_{16})^{(2)} + (\hat{Q}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1 \tag{151}$$

Where we suppose 152

(I) (5) $(a_i)^{(3)}, (a_i')^{(3)}, (a_i'')^{(3)}, (b_i)^{(3)}, (b_i')^{(3)}, (b_i'')^{(3)} > 0, i, j = 20, 21, 22$ 153

The functions $(a_i'')^{(3)}, (b_i'')^{(3)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(3)}, (r_i)^{(3)}$:

$$(a_i'')^{(3)}(T_{21}, t) \leq (p_i)^{(3)} \leq (\hat{A}_{20})^{(3)}$$

$$(b_i'')^{(3)}(G_{23}, t) \leq (r_i)^{(3)} \leq (b_i')^{(3)} \leq (\hat{B}_{20})^{(3)}$$

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$

171

They satisfy Lipschitz condition:

$$|(a_i'')^{(4)}(T_{25}', t) - (a_i'')^{(4)}(T_{25}, t)| \leq (\hat{k}_{24})^{(4)} |T_{25}' - T_{25}| e^{-(\hat{M}_{24})^{(4)}t}$$

$$|(b_i'')^{(4)}((G_{27})', t) - (b_i'')^{(4)}((G_{27}), t)| \leq (\hat{k}_{24})^{(4)} |(G_{27})' - (G_{27})| e^{-(\hat{M}_{24})^{(4)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(4)}(T_{25}', t)$ and $(a_i'')^{(4)}(T_{25}, t)$. (T_{25}', t) and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that $(a_i'')^{(4)}(T_{25}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function $(a_i'')^{(4)}(T_{25}, t)$, the **FOURTH augmentation coefficient WOULD** be absolutely continuous.

172

173

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

174

$(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}} , \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

175

(P) (9) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}, (\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}, (a_i')^{(4)}, (b_i)^{(4)}, (b_i')^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}, i = 24, 25, 26$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a_i')^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b_i')^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

Where we suppose

176

$$(a_i)^{(5)}, (a_i')^{(5)}, (a_i'')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (b_i'')^{(5)} > 0, \quad i, j = 28, 29, 30$$

177

(R) (10) The functions $(a_i'')^{(5)}, (b_i'')^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}, (r_i)^{(5)}$:

$$(a_i'')^{(5)}(T_{29}, t) \leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)}$$

$$(b_i'')^{(5)}((G_{31}), t) \leq (r_i)^{(5)} \leq (\hat{B}_{28})^{(5)}$$

178

$$(S) \quad (11) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(5)}(T_{29}, t) = (p_i)^{(5)}$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(5)}(G_{31}, t) = (r_i)^{(5)}$$

Definition of $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}$:

Where $(\hat{A}_{28})^{(5)}, (\hat{B}_{28})^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}$ are positive constants and $i = 28, 29, 30$

They satisfy Lipschitz condition:

179

$$|(a_i'')^{(5)}(T_{29}', t) - (a_i'')^{(5)}(T_{29}, t)| \leq (\hat{k}_{28})^{(5)} |T_{29}' - T_{29}| e^{-(\hat{M}_{28})^{(5)}t}$$

$$|(b_i'')^{(5)}((G_{31})', t) - (b_i'')^{(5)}((G_{31}), t)| \leq (\hat{k}_{28})^{(5)} |(G_{31})' - (G_{31})| e^{-(\hat{M}_{28})^{(5)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(5)}(T_{29}', t)$ and $(a_i'')^{(5)}(T_{29}, t)$. (T_{29}', t) and (T_{29}, t) are points belonging to the interval $[(\hat{k}_{28})^{(5)}, (\hat{M}_{28})^{(5)}]$. It is to be noted that $(a_i'')^{(5)}(T_{29}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{28})^{(5)} = 5$ then the function $(a_i'')^{(5)}(T_{29}, t)$, the **FIFTH augmentation coefficient** attributable would be absolutely continuous.

180

181

Definition of $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$:

$(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}$, are positive constants

$$\frac{(a_i)^{(5)}}{(\hat{M}_{28})^{(5)}} , \frac{(b_i)^{(5)}}{(\hat{M}_{28})^{(5)}} < 1$$

Definition of $(\hat{P}_{28})^{(5)}, (\hat{Q}_{28})^{(5)}$:

182

There exists two constants $(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ which together with $(\hat{M}_{28})^{(5)}, (\hat{k}_{28})^{(5)}, (\hat{A}_{28})^{(5)}$ and $(\hat{B}_{28})^{(5)}$ and the constants $(a_i)^{(5)}, (a_i')^{(5)}, (b_i)^{(5)}, (b_i')^{(5)}, (p_i)^{(5)}, (r_i)^{(5)}, i = 28, 29, 30$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(a_i)^{(5)} + (a_i')^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(b_i)^{(5)} + (b_i')^{(5)} + (\hat{B}_{28})^{(5)} + (\hat{Q}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

Where we suppose

183

$$(a_i)^{(6)}, (a_i')^{(6)}, (a_i'')^{(6)}, (b_i)^{(6)}, (b_i')^{(6)}, (b_i'')^{(6)} > 0, \quad i, j = 32, 33, 34$$

184

(12) The functions $(a_i'')^{(6)}, (b_i'')^{(6)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(6)}, (r_i)^{(6)}$:
 $(a_i'')^{(6)}(T_{33}, t) \leq (p_i)^{(6)} \leq (\hat{A}_{32})^{(6)}$
 $(b_i'')^{(6)}((G_{35}), t) \leq (r_i)^{(6)} \leq (b_i')^{(6)} \leq (\hat{B}_{32})^{(6)}$

185

(13) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(6)}(T_{33}, t) = (p_i)^{(6)}$
 $\lim_{G \rightarrow \infty} (b_i'')^{(6)}((G_{35}), t) = (r_i)^{(6)}$

Definition of $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}$:

Where $(\hat{A}_{32})^{(6)}, (\hat{B}_{32})^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}$ are positive constants and $i = 32, 33, 34$

They satisfy Lipschitz condition:

186

$$|(a_i'')^{(6)}(T'_{33}, t) - (a_i'')^{(6)}(T_{33}, t)| \leq (\hat{k}_{32})^{(6)} |T'_{33} - T_{33}| e^{-(M_{32})^{(6)}t}$$

$$|(b_i'')^{(6)}((G_{35})', t) - (b_i'')^{(6)}((G_{35}), t)| < (\hat{k}_{32})^{(6)} ||G_{35} - (G_{35})'| e^{-(M_{32})^{(6)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(6)}(T'_{33}, t)$ and $(a_i'')^{(6)}(T_{33}, t)$. (T'_{33}, t) and (T_{33}, t) are points belonging to the interval $[(\hat{k}_{32})^{(6)}, (\hat{M}_{32})^{(6)}]$. It is to be noted that $(a_i'')^{(6)}(T_{33}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{32})^{(6)} = 6$ then the function $(a_i'')^{(6)}(T_{33}, t)$, the **SIXTH augmentation coefficient** would be absolutely continuous.

187

Definition of $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$:

188

$(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}$, are positive constants

$$\frac{(a_i)^{(6)}}{(\hat{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\hat{M}_{32})^{(6)}} < 1$$

Definition of $(\hat{P}_{32})^{(6)}, (\hat{Q}_{32})^{(6)}$:

189

There exists two constants $(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ which together with $(\hat{M}_{32})^{(6)}, (\hat{k}_{32})^{(6)}, (\hat{A}_{32})^{(6)}$ and $(\hat{B}_{32})^{(6)}$ and the constants $(a_i)^{(6)}, (a_i')^{(6)}, (b_i)^{(6)}, (b_i')^{(6)}, (p_i)^{(6)}, (r_i)^{(6)}, i = 32, 33, 34$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(a_i)^{(6)} + (a_i')^{(6)} + (\hat{A}_{32})^{(6)} + (\hat{P}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

$$\frac{1}{(\hat{M}_{32})^{(6)}} [(b_i)^{(6)} + (b_i')^{(6)} + (\hat{B}_{32})^{(6)} + (\hat{Q}_{32})^{(6)} (\hat{k}_{32})^{(6)}] < 1$$

Where we suppose

190

(V) $(a_i)^{(7)}, (a_i')^{(7)}, (a_i'')^{(7)}, (b_i)^{(7)}, (b_i')^{(7)}, (b_i'')^{(7)} > 0$,
 $i, j = 36, 37, 38$

191

(W) The functions $(a_i'')^{(7)}, (b_i'')^{(7)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(7)}, (r_i)^{(7)}$:

$$(a_i'')^{(7)}(T_{37}, t) \leq (p_i)^{(7)} \leq (\hat{A}_{36})^{(7)}$$

$$(b_i'')^{(7)}(G, t) \leq (r_i)^{(7)} \leq (b_i')^{(7)} \leq (\hat{B}_{36})^{(7)}$$

192

(X) $\lim_{T_2 \rightarrow \infty} (a_i'')^{(7)}(T_{37}, t) = (p_i)^{(7)}$
 $\lim_{G \rightarrow \infty} (b_i'')^{(7)}((G_{39}), t) = (r_i)^{(7)}$

Definition of $(\hat{A}_{36})^{(7)}, (\hat{B}_{36})^{(7)}$:

Where $(\hat{A}_{36})^{(7)}, (\hat{B}_{36})^{(7)}, (p_i)^{(7)}, (r_i)^{(7)}$ are positive constants and $i = 36, 37, 38$

They satisfy Lipschitz condition:

193

$$|(a_i'')^{(7)}(T'_{37}, t) - (a_i'')^{(7)}(T_{37}, t)| \leq (\hat{k}_{36})^{(7)} |T'_{37} - T_{37}| e^{-(M_{36})^{(7)}t}$$

$$|(b_i'')^{(7)}((G_{39})', t) - (b_i'')^{(7)}((G_{39}), (T_{39}))| < (\hat{k}_{36})^{(7)} ||G_{39} - (G_{39})'| e^{-(M_{36})^{(7)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(7)}(T'_{37}, t)$ and $(a_i'')^{(7)}(T_{37}, t)$. (T'_{37}, t) and (T_{37}, t) are points belonging to the interval $[(\hat{k}_{36})^{(7)}, (\hat{M}_{36})^{(7)}]$. It is to be noted that $(a_i'')^{(7)}(T_{37}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{36})^{(7)} = 7$ then the function $(a_i'')^{(7)}(T_{37}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

194

Definition of $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}$:

195

(Y) $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}$, are positive constants

$$\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}}, \frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} < 1$$

Definition of $(\hat{P}_{36})^{(7)}, (\hat{Q}_{36})^{(7)}$:

196

(Z) There exists two constants $(\hat{P}_{36})^{(7)}$ and $(\hat{Q}_{36})^{(7)}$ which together with $(\hat{M}_{36})^{(7)}, (\hat{k}_{36})^{(7)}, (\hat{A}_{36})^{(7)}$ and $(\hat{B}_{36})^{(7)}$ and the constants $(a_i)^{(7)}, (a'_i)^{(7)}, (b_i)^{(7)}, (b'_i)^{(7)}, (p_i)^{(7)}, (r_i)^{(7)}, i = 36, 37, 38$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{36})^{(7)}} [(a_i)^{(7)} + (a'_i)^{(7)} + (\hat{A}_{36})^{(7)} + (\hat{P}_{36})^{(7)} (\hat{k}_{36})^{(7)}] < 1$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$

: if the conditions IN THE FOREGOING are fulfilled, there exists a solution satisfying the conditions

Definition of $G_i(0), T_i(0)$:

$$G_i(t) \leq (\hat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t}, \quad \boxed{G_i(0) = G_i^0 > 0}$$

$$T_i(t) \leq (\hat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t}, \quad \boxed{T_i(0) = T_i^0 > 0}$$

Proof:

Consider operator $\mathcal{A}^{(7)}$ defined on the space of sextuples of continuous functions $G_i, T_i: \mathbb{R}_+ \rightarrow \mathbb{R}_+$ which satisfy

$$G_i(0) = G_i^0, T_i(0) = T_i^0, G_i^0 \leq (\hat{P}_{36})^{(7)}, T_i^0 \leq (\hat{Q}_{36})^{(7)}, \quad 263$$

$$0 \leq G_i(t) - G_i^0 \leq (\hat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t} \quad 264$$

$$0 \leq T_i(t) - T_i^0 \leq (\hat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t} \quad 265$$

By 266

$$\bar{G}_{36}(t) = G_{36}^0 + \int_0^t \left[(a_{36})^{(7)} G_{37}(s_{(36)}) - \left((a'_{36})^{(7)} + a''_{36}(s_{(36)}) \right) T_{37}(s_{(36)}) \right] G_{36}(s_{(36)}) ds_{(36)} \quad 267$$

$$\bar{G}_{37}(t) = G_{37}^0 + \int_0^t \left[(a_{37})^{(7)} G_{36}(s_{(36)}) - \left((a'_{37})^{(7)} + a''_{37}(s_{(36)}) \right) T_{37}(s_{(36)}) \right] G_{37}(s_{(36)}) ds_{(36)}$$

$$\bar{G}_{38}(t) = G_{38}^0 + \int_0^t \left[(a_{38})^{(7)} G_{37}(s_{(36)}) - \left((a'_{38})^{(7)} + a''_{38}(s_{(36)}) \right) T_{37}(s_{(36)}) \right] G_{38}(s_{(36)}) ds_{(36)} \quad 268$$

$$\bar{T}_{36}(t) = T_{36}^0 + \int_0^t \left[(b_{36})^{(7)} T_{37}(s_{(36)}) - \left((b'_{36})^{(7)} - (b''_{36})^{(7)}(G(s_{(36)}), s_{(36)})) \right) T_{36}(s_{(36)}) \right] ds_{(36)} \quad 269$$

$$\bar{T}_{37}(t) = T_{37}^0 + \int_0^t \left[(b_{37})^{(7)} T_{36}(s_{(36)}) - \left((b'_{37})^{(7)} - (b''_{37})^{(7)}(G(s_{(36)}), s_{(36)})) \right) T_{37}(s_{(36)}) \right] ds_{(36)} \quad 270$$

$$\bar{T}_{38}(t) = T_{38}^0 + \int_0^t \left[(b_{38})^{(7)} T_{37}(s_{(36)}) - \left((b'_{38})^{(7)} - (b''_{38})^{(7)}(G(s_{(36)}), s_{(36)})) \right) T_{38}(s_{(36)}) \right] ds_{(36)} \quad 271$$

Where $s_{(36)}$ is the integrand that is integrated over an interval $(0, t)$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$ 272

(a) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself. Indeed it is obvious that 273

$$G_{24}(t) \leq G_{24}^0 + \int_0^t \left[(a_{24})^{(4)} \left(G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(M_{24})^{(4)}s_{(24)}} \right) \right] ds_{(24)} =$$

$$(1 + (a_{24})^{(4)}t)G_{25}^0 + \frac{(a_{24})^{(4)}(P_{24})^{(4)}}{(M_{24})^{(4)}}(e^{(M_{24})^{(4)}t} - 1)$$

From which it follows that

274

$$(G_{24}(t) - G_{24}^0)e^{-(M_{24})^{(4)}t} \leq \frac{(a_{24})^{(4)}}{(M_{24})^{(4)}} \left[((\hat{P}_{24})^{(4)} + G_{25}^0)e^{-\frac{((\hat{P}_{24})^{(4)} + G_{25}^0)}{G_{25}^0}} + (\hat{P}_{24})^{(4)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

(b) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

275

$$G_{28}(t) \leq G_{28}^0 + \int_0^t [(a_{28})^{(5)}(G_{29}^0 + (\hat{P}_{28})^{(5)}e^{(M_{28})^{(5)}s(28)})] ds_{(28)} = (1 + (a_{28})^{(5)}t)G_{29}^0 + \frac{(a_{28})^{(5)}(P_{28})^{(5)}}{(M_{28})^{(5)}}(e^{(M_{28})^{(5)}t} - 1)$$

From which it follows that

276

$$(G_{28}(t) - G_{28}^0)e^{-(M_{28})^{(5)}t} \leq \frac{(a_{28})^{(5)}}{(M_{28})^{(5)}} \left[((\hat{P}_{28})^{(5)} + G_{29}^0)e^{-\frac{((\hat{P}_{28})^{(5)} + G_{29}^0)}{G_{29}^0}} + (\hat{P}_{28})^{(5)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

(c) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

277

$$G_{32}(t) \leq G_{32}^0 + \int_0^t [(a_{32})^{(6)}(G_{33}^0 + (\hat{P}_{32})^{(6)}e^{(M_{32})^{(6)}s(32)})] ds_{(32)} = (1 + (a_{32})^{(6)}t)G_{33}^0 + \frac{(a_{32})^{(6)}(P_{32})^{(6)}}{(M_{32})^{(6)}}(e^{(M_{32})^{(6)}t} - 1)$$

From which it follows that

278

$$(G_{32}(t) - G_{32}^0)e^{-(M_{32})^{(6)}t} \leq \frac{(a_{32})^{(6)}}{(M_{32})^{(6)}} \left[((\hat{P}_{32})^{(6)} + G_{33}^0)e^{-\frac{((\hat{P}_{32})^{(6)} + G_{33}^0)}{G_{33}^0}} + (\hat{P}_{32})^{(6)} \right]$$

(G_i^0) is as defined in the statement of theorem 1

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$

(d) The operator $\mathcal{A}^{(7)}$ maps the space of functions satisfying 37,35,36 into itself .Indeed it is obvious that

279

$$G_{36}(t) \leq G_{36}^0 + \int_0^t [(a_{36})^{(7)}(G_{37}^0 + (\hat{P}_{36})^{(7)}e^{(M_{36})^{(7)}s(36)})] ds_{(36)} = (1 + (a_{36})^{(7)}t)G_{37}^0 + \frac{(a_{36})^{(7)}(P_{36})^{(7)}}{(M_{36})^{(7)}}(e^{(M_{36})^{(7)}t} - 1)$$

From which it follows that

280

$$(G_{36}(t) - G_{36}^0)e^{-(M_{36})^{(7)}t} \leq \frac{(a_{36})^{(7)}}{(M_{36})^{(7)}} \left[((\hat{P}_{36})^{(7)} + G_{37}^0)e^{-\frac{((\hat{P}_{36})^{(7)} + G_{37}^0)}{G_{37}^0}} + (\hat{P}_{36})^{(7)} \right]$$

(G_i^0) is as defined in the statement of theorem 7

It is now sufficient to take $\frac{(a_i)^{(1)}}{(M_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(M_{13})^{(1)}} < 1$ and to choose

281

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have

282

$$\frac{(a_i)^{(1)}}{(M_{13})^{(1)}} \left[(\hat{P}_{13})^{(1)} + ((\hat{P}_{13})^{(1)} + G_j^0)e^{-\frac{((\hat{P}_{13})^{(1)} + G_j^0)}{G_j^0}} \right] \leq (\hat{P}_{13})^{(1)}$$

283

$$\frac{(b_i)^{(1)}}{(M_{13})^{(1)}} \left[((\hat{Q}_{13})^{(1)} + T_j^0)e^{-\frac{((\hat{Q}_{13})^{(1)} + T_j^0)}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)}$$

284

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself

285

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric

286

$$d((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)|e^{-(M_{13})^{(1)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)|e^{-(M_{13})^{(1)}t} \}$$

Indeed if we denote

287

Definition of \tilde{G}, \tilde{T} :

$$(\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_i^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}} ds_{(13)} + \int_0^t \{(a'_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{-(\bar{M}_{13})^{(1)}s_{(13)}} + (a''_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}} + G_{13}^{(2)} |(a'_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) - (a''_{13})^{(1)} (T_{14}^{(2)}, s_{(13)})| e^{-(\bar{M}_{13})^{(1)}s_{(13)}} e^{(\bar{M}_{13})^{(1)}s_{(13)}}\} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{13})^{(1)}t} \leq \frac{1}{(\bar{M}_{13})^{(1)}} ((a_{13})^{(1)} + (a'_{13})^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}) d((G^{(1)}, T^{(1)}; G^{(2)}, T^{(2)})) \tag{288}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{13})^{(1)}$ and $(b''_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ and $(\hat{Q}_{13})^{(1)} e^{(\bar{M}_{13})^{(1)}t}$ respectively of \mathbb{R}_+ . 289

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$, $i = 13, 14, 15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 290

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(1)} - (a''_i)^{(1)}(T_{14}(s_{(13)}), s_{(13)})\} ds_{(13)}} \geq 0 \tag{291}$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(1)}t} > 0 \text{ for } t > 0$$

Definition of $((\bar{M}_{13})^{(1)})_1$, and $((\bar{M}_{13})^{(1)})_3$: 292

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$G_{13} < (\bar{M}_{13})^{(1)}$ it follows $\frac{dG_{14}}{dt} \leq ((\bar{M}_{13})^{(1)})_1 - (a'_{14})^{(1)} G_{14}$ and by integrating

$$G_{14} \leq ((\bar{M}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)} ((\bar{M}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\bar{M}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)} ((\bar{M}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13} , G_{15} and G_{13} , G_{14} respectively.

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below. 293

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(1)}(G(t), t)) = (b'_{14})^{(1)}$ then $T_{14} \rightarrow \infty$. 294

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b''_i)^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to 295

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right), t = \log \frac{2}{\varepsilon_1} \text{ By taking now } \varepsilon_1 \text{ sufficiently small one sees that } T_{14} \text{ is unbounded. The}$$

same property holds for T_{15} if $\lim_{t \rightarrow \infty} ((b''_{15})^{(1)}(G(t), t)) = (b'_{15})^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions 296

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} < 1$ and to choose 297

$(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ large to have

$$\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[(\hat{P}_{16})^{(2)} + ((\hat{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\hat{P}_{16})^{(2)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{16})^{(2)} \tag{298}$$

$$\frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\hat{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{16})^{(2)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{16})^{(2)} \right] \leq (\hat{Q}_{16})^{(2)} \tag{299}$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i satisfying 300

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric 301

$$d(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)})) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t} \}$$

Indeed if we denote

$$\underline{\text{Definition of}} \widetilde{G}_{19}, \widetilde{T}_{19} : (\widetilde{G}_{19}, \widetilde{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19})$$

It results

$$\begin{aligned} |\widetilde{G}_{16}^{(1)} - \widetilde{G}_i^{(2)}| &\leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} ds_{(16)} + \\ &\int_0^t \{ (a'_{16})^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{-(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &(a''_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &G_{16}^{(2)} | (a''_{16})^{(2)} (T_{17}^{(1)}, s_{(16)}) - (a''_{16})^{(2)} (T_{17}^{(2)}, s_{(16)}) | e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} \} ds_{(16)} \end{aligned}$$

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\begin{aligned} |(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\bar{M}_{16})^{(2)}t} &\leq \\ \frac{1}{(\bar{M}_{16})^{(2)}} &((a_{16})^{(2)} + (a'_{16})^{(2)} + (\widehat{A}_{16})^{(2)} + (\widehat{P}_{16})^{(2)} (\widehat{k}_{16})^{(2)}) d((G_{19})^{(1)}, (T_{19})^{(1)}; (G_{19})^{(2)}, (T_{19})^{(2)}) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ and $(\widehat{Q}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(2)}$ and $(b''_i)^{(2)}$, $i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(2)} - (a''_i)^{(2)} (T_{17}(s_{(16)}), s_{(16)}) \} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(2)}t} > 0 \quad \text{for } t > 0$$

Definition of $((\bar{M}_{16})^{(2)})_1, ((\bar{M}_{16})^{(2)})_2$ and $((\bar{M}_{16})^{(2)})_3$:

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if

$$G_{16} < ((\bar{M}_{16})^{(2)}) \text{ it follows } \frac{dG_{17}}{dt} \leq ((\bar{M}_{16})^{(2)})_1 - (a'_{17})^{(2)} G_{17} \text{ and by integrating}$$

$$G_{17} \leq ((\bar{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)} ((\bar{M}_{16})^{(2)})_1 / (a'_{17})^{(2)}$$

In the same way, one can obtain

$$G_{18} \leq ((\bar{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)} ((\bar{M}_{16})^{(2)})_2 / (a'_{18})^{(2)}$$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively.

Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below.

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(2)} ((G_{19})(t), t)) = (b'_{17})^{(2)}$ then $T_{17} \rightarrow \infty$.

Definition of $(m)^{(2)}$ and ε_2 :

Indeed let t_2 be so that for $t > t_2$

$$(b_{17})^{(2)} - (b''_i)^{(2)} ((G_{19})(t), t) < \varepsilon_2, T_{16}(t) > (m)^{(2)}$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)} (m)^{(2)} - \varepsilon_2 T_{17}$ which leads to

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)} (m)^{(2)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_2} \text{ By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The}$$

same property holds for T_{18} if $\lim_{t \rightarrow \infty} (b''_{18})^{(2)} ((G_{19})(t), t) = (b'_{18})^{(2)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

It is now sufficient to take $\frac{(a_i)^{(3)}}{(M_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(M_{20})^{(3)}} < 1$ and to choose

$(\widehat{P}_{20})^{(3)}$ and $(\widehat{Q}_{20})^{(3)}$ large to have

$$\frac{(a_i)^{(3)}}{(M_{20})^{(3)}} \left[(\widehat{P}_{20})^{(3)} + ((\widehat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{20})^{(3)}$$

$$\frac{(b_i)^{(3)}}{(M_{20})^{(3)}} \left[((\widehat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{20})^{(3)} \right] \leq (\widehat{Q}_{20})^{(3)}$$

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i into itself

The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric

$$d\left(\left((G_{23})^{(1)}, (T_{23})^{(1)}\right), \left((G_{23})^{(2)}, (T_{23})^{(2)}\right)\right) = \sup_{t \in \mathbb{R}_+} \left\{ \max_{i \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)}t}, \max_{i \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{20})^{(3)}t} \right\}$$

320

Indeed if we denote

$$\underline{\text{Definition of}} \widetilde{G}_{23}, \widetilde{T}_{23} : \left((\widetilde{G}_{23}), (\widetilde{T}_{23}) \right) = \mathcal{A}^{(3)}\left((G_{23}), (T_{23}) \right)$$

321

It results

$$\begin{aligned} |\widetilde{G}_{20}^{(1)} - \widetilde{G}_i^{(2)}| &\leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} ds_{(20)} + \\ &\int_0^t \left\{ (a'_{20})^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{-(\bar{M}_{20})^{(3)}s_{(20)}} + \right. \\ &(a''_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} + \\ &\left. G_{20}^{(2)} |(a'_{20})^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a'_{20})^{(3)} (T_{21}^{(2)}, s_{(20)})| e^{-(\bar{M}_{20})^{(3)}s_{(20)}} e^{(\bar{M}_{20})^{(3)}s_{(20)}} \right\} ds_{(20)} \end{aligned}$$

322

323

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$|G^{(1)} - G^{(2)}| e^{-(\bar{M}_{20})^{(3)}t} \leq$$

324

$$\frac{1}{(\bar{M}_{20})^{(3)}} \left((a_{20})^{(3)} + (a'_{20})^{(3)} + (\bar{A}_{20})^{(3)} + (\bar{P}_{20})^{(3)} (\bar{k}_{20})^{(3)} \right) d\left(\left((\widetilde{G}_{23})^{(1)}, (T_{23})^{(1)}\right); (G_{23})^{(2)}, (T_{23})^{(2)}\right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a''_{20})^{(3)}$ and $(b''_{20})^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\bar{P}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ and $(\bar{Q}_{20})^{(3)} e^{(\bar{M}_{20})^{(3)}t}$ respectively of \mathbb{R}_+ .

325

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(3)}$ and $(b''_i)^{(3)}$, $i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

326

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \left\{ (a'_i)^{(3)} - (a''_i)^{(3)} (T_{21}(s_{(20)}), s_{(20)}) \right\} ds_{(20)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(3)}t} > 0 \text{ for } t > 0$$

Definition of $((\bar{M}_{20})^{(3)})_1$, $((\bar{M}_{20})^{(3)})_2$ and $((\bar{M}_{20})^{(3)})_3$:

327

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$$G_{20} < (\bar{M}_{20})^{(3)} \text{ it follows } \frac{dG_{21}}{dt} \leq ((\bar{M}_{20})^{(3)})_1 - (a'_{21})^{(3)} G_{21} \text{ and by integrating}$$

$$G_{21} \leq ((\bar{M}_{20})^{(3)})_2 = G_{21}^0 + 2(a_{21})^{(3)} ((\bar{M}_{20})^{(3)})_1 / (a'_{21})^{(3)}$$

In the same way, one can obtain

$$G_{22} \leq ((\bar{M}_{20})^{(3)})_3 = G_{22}^0 + 2(a_{22})^{(3)} ((\bar{M}_{20})^{(3)})_2 / (a'_{22})^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively.

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below.

328

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b'_i)^{(3)}((G_{23})(t), t)) = (b'_{21})^{(3)}$ then $T_{21} \rightarrow \infty$.

329

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$

$$(b_{21})^{(3)} - (b'_i)^{(3)}((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)}$$

330

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)}(m)^{(3)} - \varepsilon_3 T_{21}$ which leads to

331

$$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{2} \right), t = \log \frac{2}{\varepsilon_3} \text{ By taking now } \varepsilon_3 \text{ sufficiently small one sees that } T_{21} \text{ is unbounded. The}$$

same property holds for T_{22} if $\lim_{t \rightarrow \infty} (b''_{22})^{(3)}((G_{23})(t), t) = (b'_{22})^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

332

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\bar{M}_{24})^{(4)}} , \frac{(b_i)^{(4)}}{(\bar{M}_{24})^{(4)}} < 1$ and to choose

333

$(\bar{P}_{24})^{(4)}$ and $(\bar{Q}_{24})^{(4)}$ large to have

$$\frac{(a_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[(\widehat{P}_{24})^{(4)} + ((\widehat{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{24})^{(4)} + G_j^0}{G_j^0}\right)} \right] \leq (\widehat{P}_{24})^{(4)} \quad 334$$

$$\frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[((\widehat{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{24})^{(4)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{24})^{(4)} \right] \leq (\widehat{Q}_{24})^{(4)} \quad 335$$

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i satisfying IN to itself 336

The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric 337

$$d \left(((G_{27})^{(1)}, (T_{27})^{(1)}), ((G_{27})^{(2)}, (T_{27})^{(2)}) \right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t} \right\}$$

Indeed if we denote

Definition of $(\widehat{G}_{27}), (\widehat{T}_{27}) : ((\widehat{G}_{27}), (\widehat{T}_{27})) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$

It results

$$\begin{aligned} |\widehat{G}_{24}^{(1)} - \widehat{G}_{24}^{(2)}| &\leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} ds(24) + \\ &\int_0^t \{ (a_{24}')^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{-(\widehat{M}_{24})^{(4)}s(24)} + \\ &(a_{24}'')^{(4)} (T_{25}^{(1)}, s(24)) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} + \\ &G_{24}^{(2)} |(a_{24}'')^{(4)} (T_{25}^{(1)}, s(24)) - (a_{24}'')^{(4)} (T_{25}^{(2)}, s(24))| e^{-(\widehat{M}_{24})^{(4)}s(24)} e^{(\widehat{M}_{24})^{(4)}s(24)} \} ds(24) \end{aligned}$$

Where $s(24)$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows 338

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\widehat{M}_{24})^{(4)}t} \leq \frac{1}{(\widehat{M}_{24})^{(4)}} \left((a_{24})^{(4)} + (a_{24}')^{(4)} + (\widehat{A}_{24})^{(4)} + (\widehat{P}_{24})^{(4)} (\widehat{K}_{24})^{(4)} \right) d \left(((G_{27})^{(1)}, (T_{27})^{(1)}); (G_{27})^{(2)}, (T_{27})^{(2)} \right) \quad 339$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a_{24}'')^{(4)}$ and $(b_{24}'')^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ and $(\widehat{Q}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ respectively of \mathbb{R}_+ . 340

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(4)}$ and $(b_i'')^{(4)}$, $i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 341

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i')^{(4)} - (a_i'')^{(4)} (T_{25}(s(24)), s(24)) \} ds(24)} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(4)}t} > 0 \text{ for } t > 0$$

Definition of $((\widehat{M}_{24})^{(4)})_1, ((\widehat{M}_{24})^{(4)})_2$ and $((\widehat{M}_{24})^{(4)})_3$: 342

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$$G_{24} < (\widehat{M}_{24})^{(4)} \text{ it follows } \frac{dG_{25}}{dt} \leq ((\widehat{M}_{24})^{(4)})_1 - (a_{25}')^{(4)} G_{25} \text{ and by integrating}$$

$$G_{25} \leq ((\widehat{M}_{24})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)} ((\widehat{M}_{24})^{(4)})_1 / (a_{25}')^{(4)}$$

In the same way, one can obtain

$$G_{26} \leq ((\widehat{M}_{24})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)} ((\widehat{M}_{24})^{(4)})_2 / (a_{26}')^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24}, G_{26} and G_{24}, G_{25} respectively.

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below. 343

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(4)}((G_{27})(t), t)) = (b_{25}')^{(4)}$ then $T_{25} \rightarrow \infty$. 344

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25})^{(4)} - (b_i'')^{(4)}((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)}$$

Then $\frac{dT_{25}}{dt} \geq (a_{25})^{(4)}(m)^{(4)} - \varepsilon_4 T_{25}$ which leads to 345

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{2} \right), t = \log \frac{2}{\varepsilon_4}$ By taking now ε_4 sufficiently small one sees that T_{25} is unbounded. The same property holds for T_{26} if $\lim_{t \rightarrow \infty} (b_{26}'')^{(4)}((G_{27})(t), t) = (b_{26}')^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ANALOGOUS inequalities

hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$

346

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\widehat{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} < 1$ and to choose $(\widehat{P}_{28})^{(5)}$ and $(\widehat{Q}_{28})^{(5)}$ large to have

347

$$\frac{(a_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[(\widehat{P}_{28})^{(5)} + ((\widehat{P}_{28})^{(5)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{28})^{(5)} + G_j^0}{G_j^0}\right)} \right] \leq (\widehat{P}_{28})^{(5)}$$

348

$$\frac{(b_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[((\widehat{Q}_{28})^{(5)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{28})^{(5)} + T_j^0}{T_j^0}\right)} + (\widehat{Q}_{28})^{(5)} \right] \leq (\widehat{Q}_{28})^{(5)}$$

349

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i into itself

350

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric

351

$$d\left(\left((G_{31})^{(1)}, (T_{31})^{(1)}\right), \left((G_{31})^{(2)}, (T_{31})^{(2)}\right)\right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t} \right\}$$

352

Indeed if we denote

$$\text{Definition of } (\widehat{G}_{31}), (\widehat{T}_{31}) : \left((\widehat{G}_{31}), (\widehat{T}_{31}) \right) = \mathcal{A}^{(5)}\left((G_{31}), (T_{31}) \right)$$

It results

$$\begin{aligned} |\widehat{G}_{28}^{(1)} - \widehat{G}_{28}^{(2)}| &\leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} ds_{(28)} + \\ &\int_0^t \left\{ (a'_{28})^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} + \right. \\ &(a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} + \\ &\left. G_{28}^{(2)} |(a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a''_{28})^{(5)} (T_{29}^{(2)}, s_{(28)})| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} \right\} ds_{(28)} \end{aligned}$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$\begin{aligned} |(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\widehat{M}_{28})^{(5)}t} &\leq \\ \frac{1}{(\widehat{M}_{28})^{(5)}} \left((a_{28})^{(5)} + (a'_{28})^{(5)} + (\widehat{A}_{28})^{(5)} + (\widehat{P}_{28})^{(5)} (\widehat{k}_{28})^{(5)} \right) &d\left(\left((G_{31})^{(1)}, (T_{31})^{(1)}\right); (G_{31})^{(2)}, (T_{31})^{(2)}\right) \end{aligned}$$

353

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows

Remark 1: The fact that we supposed $(a''_{28})^{(5)}$ and $(b''_{28})^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ .

354

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(5)}$ and $(b''_i)^{(5)}, i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

355

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a'_i)^{(5)} - (a''_i)^{(5)}(T_{29}(s_{(28)}), s_{(28)})\} ds_{(28)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(5)}t} > 0 \text{ for } t > 0$$

$$\text{Definition of } ((\widehat{M}_{28})^{(5)})_1, ((\widehat{M}_{28})^{(5)})_2 \text{ and } ((\widehat{M}_{28})^{(5)})_3 :$$

356

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$$G_{28} < (\widehat{M}_{28})^{(5)} \text{ it follows } \frac{dG_{29}}{dt} \leq ((\widehat{M}_{28})^{(5)})_1 - (a'_{29})^{(5)} G_{29} \text{ and by integrating}$$

$$G_{29} \leq ((\widehat{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29})^{(5)} ((\widehat{M}_{28})^{(5)})_1 / (a'_{29})^{(5)}$$

In the same way, one can obtain

$$G_{30} \leq ((\widehat{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30})^{(5)} ((\widehat{M}_{28})^{(5)})_2 / (a'_{30})^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28}, G_{30} and G_{28}, G_{29} respectively.

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below.

357

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(5)}((G_{31})(t), t)) = (b'_{29})^{(5)}$ then $T_{29} \rightarrow \infty$.

358

Definition of $(m)^{(5)}$ and ε_5 :

Indeed let t_5 be so that for $t > t_5$

$$(b_{29})^{(5)} - (b''_i)^{(5)}((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)}$$

Then $\frac{dT_{29}}{dt} \geq (a_{29})^{(5)}(m)^{(5)} - \varepsilon_5 T_{29}$ which leads to

360

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t}$$

If we take t such that $e^{-\varepsilon_5 t} = \frac{1}{2}$ it results

$$T_{29} \geq \left(\frac{(a_{29})^{(5)}(m)^{(5)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_5}$$

By taking now ε_5 sufficiently small one sees that T_{29} is unbounded. The

same property holds for T_{30} if $\lim_{t \rightarrow \infty} (b_{30}'')^{(5)}((G_{31})(t), t) = (b_{30}')^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$

361

It is now sufficient to take $\frac{(a_i)^{(6)}}{(M_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(M_{32})^{(6)}} < 1$ and to choose

362

$(\hat{P}_{32})^{(6)}$ and $(\hat{Q}_{32})^{(6)}$ large to have

$$\frac{(a_i)^{(6)}}{(M_{32})^{(6)}} \left[(\hat{P}_{32})^{(6)} + ((\hat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\hat{P}_{32})^{(6)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{32})^{(6)}$$

363

$$\frac{(b_i)^{(6)}}{(M_{32})^{(6)}} \left[((\hat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{32})^{(6)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{32})^{(6)} \right] \leq (\hat{Q}_{32})^{(6)}$$

364

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i into itself

365

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric

366

$$d\left(((G_{35})^{(1)}, (T_{35})^{(1)}), ((G_{35})^{(2)}, (T_{35})^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{32})^{(6)}t} \right\}$$

Indeed if we denote

$$\underline{\text{Definition of}} (\widehat{G_{35}}, \widehat{T_{35}}) : (\widehat{G_{35}}, \widehat{T_{35}}) = \mathcal{A}^{(6)}((G_{35}), (T_{35}))$$

It results

$$\begin{aligned} |\widehat{G}_{32}^{(1)} - \widehat{G}_{32}^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(M_{32})^{(6)}s} e^{(M_{32})^{(6)}s} ds + \\ &\int_0^t \{ (a_{32}')^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s} e^{-(M_{32})^{(6)}s} + \\ &(a_{32}'')^{(6)} (T_{33}^{(1)}, s) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(M_{32})^{(6)}s} e^{(M_{32})^{(6)}s} + \\ &G_{32}^{(2)} | (a_{32}'')^{(6)} (T_{33}^{(1)}, s) - (a_{32}'')^{(6)} (T_{33}^{(2)}, s) | e^{-(M_{32})^{(6)}s} e^{(M_{32})^{(6)}s} \} ds \end{aligned}$$

367

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

$$(1) \quad (a_i')^{(1)}, (a_i'')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (b_i'')^{(1)} > 0, \\ i, j = 13, 14, 15$$

(2) The functions $(a_i'')^{(1)}, (b_i'')^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (r_i)^{(1)}$:

$$(a_i'')^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}$$

$$(3) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)}$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants
 and $i = 13, 14, 15$

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T_{14}, t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T_{14} - T_{14}'| e^{-(M_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, T)| < (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(M_{13})^{(1)}t}$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(1)}(T_{14}, t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the **first augmentation coefficient** attributable to terrestrial organisms, would be absolutely continuous.

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(AA) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(BB) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

Analogous inequalities hold also for $G_{37}, G_{38}, T_{36}, T_{37}, T_{38}$

368

It is now sufficient to take $\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}}, \frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} < 7$ and to choose $(\hat{P}_{36})^{(7)}$ and $(\hat{Q}_{36})^{(7)}$ large to have

$$\frac{(a_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[(\hat{P}_{36})^{(7)} + ((\hat{P}_{36})^{(7)} + G_j^0) e^{-\left(\frac{(\hat{P}_{36})^{(7)} + G_j^0}{G_j^0}\right)} \right] \leq (\hat{P}_{36})^{(7)}$$

369

$$\frac{(b_i)^{(7)}}{(\hat{M}_{36})^{(7)}} \left[((\hat{Q}_{36})^{(7)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{36})^{(7)} + T_j^0}{T_j^0}\right)} + (\hat{Q}_{36})^{(7)} \right] \leq (\hat{Q}_{36})^{(7)}$$

370

In order that the operator $\mathcal{A}^{(7)}$ transforms the space of sextuples of functions G_i, T_i satisfying 37,35,36 into itself

371

The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric

372

$$d\left((G_{39})^{(1)}, (T_{39})^{(1)}, (G_{39})^{(2)}, (T_{39})^{(2)}\right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\hat{M}_{36})^{(7)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\hat{M}_{36})^{(7)}t} \right\}$$

Indeed if we denote

Definition of $(\widehat{G}_{39}), (\widehat{T}_{39})$:

$$((\widehat{G}_{39}), (\widehat{T}_{39})) = \mathcal{A}^{(7)}((G_{39}), (T_{39}))$$

It results

$$\begin{aligned} |\widehat{G}_{36}^{(1)} - \widehat{G}_{36}^{(2)}| &\leq \int_0^t (a_{36})^{(7)} |G_{37}^{(1)} - G_{37}^{(2)}| e^{-(\hat{M}_{36})^{(7)}s} e^{(\hat{M}_{36})^{(7)}s} ds + \\ &\int_0^t \{(a_{36}')^{(7)} |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\hat{M}_{36})^{(7)}s} e^{-(\hat{M}_{36})^{(7)}s} + \\ &(a_{36}'')^{(7)} (T_{37}^{(1)}, s) |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(\hat{M}_{36})^{(7)}s} e^{(\hat{M}_{36})^{(7)}s} + \end{aligned}$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows

373

$$\begin{aligned} & |(G_{39})^{(1)} - (G_{39})^{(2)}| e^{-(\widehat{M}_{36})^{(7)}t} \leq \\ & \frac{1}{(\widehat{M}_{36})^{(7)}} ((a_{36})^{(7)} + (a_{36}')^{(7)} + (\widehat{A}_{36})^{(7)} + (\widehat{P}_{36})^{(7)}(\widehat{k}_{36})^{(7)}) d((G_{39})^{(1)}, (T_{39})^{(1)}; (G_{39})^{(2)}, (T_{39})^{(2)}) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (37,35,36) the result follows 374

Remark 1: The fact that we supposed $(a_{36}''^{(7)})$ and $(b_{36}''^{(7)})$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)} e^{(\widehat{M}_{36})^{(7)}t}$ and $(\widehat{Q}_{36})^{(7)} e^{(\widehat{M}_{36})^{(7)}t}$ respectively of \mathbb{R}_+ . 375

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i''^{(7)})$ and $(b_i''^{(7)})$, $i = 36, 37, 38$ depend only on T_{37} and respectively on (G_{39}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

376

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 79 to 36 it results

$$\begin{aligned} G_i(t) & \geq G_i^0 e^{-\int_0^t \{(a_i')^{(7)} - (a_i'')^{(7)}(T_{37}(s_{(36)}), s_{(36)})\} ds_{(36)}} \geq 0 \\ T_i(t) & \geq T_i^0 e^{-(b_i')^{(7)}t} > 0 \quad \text{for } t > 0 \end{aligned}$$

Definition of $((\widehat{M}_{36})^{(7)})_1, ((\widehat{M}_{36})^{(7)})_2$ and $((\widehat{M}_{36})^{(7)})_3$: 377

Remark 3: if G_{36} is bounded, the same property have also G_{37} and G_{38} . indeed if

$G_{36} < (\widehat{M}_{36})^{(7)}$ it follows $\frac{dG_{37}}{dt} \leq ((\widehat{M}_{36})^{(7)})_1 - (a_{37}')^{(7)}G_{37}$ and by integrating

$$G_{37} \leq ((\widehat{M}_{36})^{(7)})_2 = G_{37}^0 + 2(a_{37})^{(7)}((\widehat{M}_{36})^{(7)})_1 / (a_{37}')^{(7)}$$

In the same way, one can obtain

$$G_{38} \leq ((\widehat{M}_{36})^{(7)})_3 = G_{38}^0 + 2(a_{38})^{(7)}((\widehat{M}_{36})^{(7)})_2 / (a_{38}')^{(7)}$$

If G_{37} or G_{38} is bounded, the same property follows for G_{36} , G_{38} and G_{36} , G_{37} respectively.

Remark 7: If G_{36} is bounded, from below, the same property holds for G_{37} and G_{38} . The proof is analogous with the preceding one. An analogous property is true if G_{37} is bounded from below. 378

Remark 5: If T_{36} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(7)}((G_{39})(t), t)) = (b_{37}')^{(7)}$ then $T_{37} \rightarrow \infty$. 379

Definition of $(m)^{(7)}$ and ε_7 :

Indeed let t_7 be so that for $t > t_7$

$$(b_{37})^{(7)} - (b_i'')^{(7)}((G_{39})(t), t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)}(m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 380

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{\varepsilon_7} \right) (1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_7 t} = \frac{1}{2} \text{ it results}$$

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_7} \text{ By taking now } \varepsilon_7 \text{ sufficiently small one sees that } T_{37} \text{ is unbounded. The same property holds for } T_{38} \text{ if } \lim_{t \rightarrow \infty} (b_{38}'')^{(7)} ((G_{39})(t), t) = (b_{38}')^{(7)}$$

We now state a more precise theorem about the behaviors at infinity of the solutions of equations 37 to 72

In order that the operator $\mathcal{A}^{(7)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS AND ITS CONCOMITANT CONDITIONALITIES into itself 381

The operator $\mathcal{A}^{(7)}$ is a contraction with respect to the metric 382
383

$$d \left(((G_{39})^{(1)}, (T_{39})^{(1)}), ((G_{39})^{(2)}, (T_{39})^{(2)}) \right) = \sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{36})^{(7)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{36})^{(7)}t} \}$$

Indeed if we denote

Definition of $(\widehat{G_{39}}), (\widehat{T_{39}})$:

$$((\widehat{G_{39}}), (\widehat{T_{39}})) = \mathcal{A}^{(7)}((G_{39}), (T_{39}))$$

It results

$$\begin{aligned} |\widehat{G}_{36}^{(1)} - \widehat{G}_{36}^{(2)}| &\leq \int_0^t (a_{36})^{(7)} |G_{37}^{(1)} - G_{37}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}} ds_{(36)} + \\ &\int_0^t \{ (a_{36}')^{(7)} |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{-(M_{36})^{(7)}s_{(36)}} + \\ &(a_{36}'')^{(7)} (T_{37}^{(1)}, s_{(36)}) |G_{36}^{(1)} - G_{36}^{(2)}| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}} + \\ &G_{36}^{(2)} |(a_{36}'')^{(7)} (T_{37}^{(1)}, s_{(36)}) - (a_{36}'')^{(7)} (T_{37}^{(2)}, s_{(36)})| e^{-(M_{36})^{(7)}s_{(36)}} e^{(M_{36})^{(7)}s_{(36)}} \} ds_{(36)} \end{aligned}$$

Where $s_{(36)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows 384

$$\begin{aligned} |(G_{39})^{(1)} - (G_{39})^{(2)}| e^{-(M_{36})^{(7)}t} &\leq \\ \frac{1}{(M_{36})^{(7)}} &((a_{36})^{(7)} + (a_{36}')^{(7)} + (\widehat{A}_{36})^{(7)} + (\widehat{P}_{36})^{(7)} (\widehat{k}_{36})^{(7)}) d \left(((G_{39})^{(1)}, (T_{39})^{(1)}; (G_{39})^{(2)}, (T_{39})^{(2)}) \right) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows

Remark 1: The fact that we supposed $(a_{36}'')^{(7)}$ and $(b_{36}'')^{(7)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{36})^{(7)} e^{(M_{36})^{(7)}t}$ and $(\widehat{Q}_{36})^{(7)} e^{(M_{36})^{(7)}t}$ respectively of \mathbb{R}_+ . 385

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(7)}$ and $(b_i'')^{(7)}, i = 36, 37, 38$ depend only on T_{37} and respectively on (G_{39}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition.

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$ 386

From CONCATENATED GLOBAL EQUATIONS it results

$$\begin{aligned} G_i(t) &\geq G_i^0 e^{-\int_0^t \{ (a_i')^{(7)} - (a_i'')^{(7)} (T_{37}(s_{(36)}), s_{(36)}) \} ds_{(36)}} \geq 0 \\ T_i(t) &\geq T_i^0 e^{-(b_i')^{(7)}t} > 0 \text{ for } t > 0 \end{aligned}$$

Definition of $((\widehat{M}_{36})^{(7)})_1, ((\widehat{M}_{36})^{(7)})_2$ and $((\widehat{M}_{36})^{(7)})_3$: 387

Remark 3: if G_{36} is bounded, the same property have also G_{37} and G_{38} . indeed if

$$G_{36} < (\widehat{M}_{36})^{(7)} \text{ it follows } \frac{dG_{37}}{dt} \leq ((\widehat{M}_{36})^{(7)})_1 - (a_{37}')^{(7)} G_{37} \text{ and by integrating}$$

$$G_{37} \leq ((\widehat{M}_{36})^{(7)})_2 = G_{37}^0 + 2(a_{37})^{(7)} ((\widehat{M}_{36})^{(7)})_1 / (a_{37}')^{(7)}$$

In the same way, one can obtain

$$G_{38} \leq ((\widehat{M}_{36})^{(7)})_3 = G_{38}^0 + 2(a_{38})^{(7)} ((\widehat{M}_{36})^{(7)})_2 / (a_{38}')^{(7)}$$

If G_{37} or G_{38} is bounded, the same property follows for G_{36} , G_{38} and G_{36} , G_{37} respectively.

Remark 7: If G_{36} is bounded, from below, the same property holds for G_{37} and G_{38} . The proof is analogous with the preceding one. An analogous property is true if G_{37} is bounded from below. 388

Remark 5: If T_{36} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(7)}((G_{39})(t), t)) = (b_{37}')^{(7)}$ then $T_{37} \rightarrow \infty$. 389

Definition of $(m)^{(7)}$ and ε_7 :

Indeed let t_7 be so that for $t > t_7$

$$(b_{37})^{(7)} - (b_i'')^{(7)}((G_{39})(t), t) < \varepsilon_7, T_{36}(t) > (m)^{(7)}$$

Then $\frac{dT_{37}}{dt} \geq (a_{37})^{(7)}(m)^{(7)} - \varepsilon_7 T_{37}$ which leads to 390

$$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{\varepsilon_7} \right) (1 - e^{-\varepsilon_7 t}) + T_{37}^0 e^{-\varepsilon_7 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_7 t} = \frac{1}{2} \text{ it results}$$

$T_{37} \geq \left(\frac{(a_{37})^{(7)}(m)^{(7)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_7}$ By taking now ε_7 sufficiently small one sees that T_{37} is unbounded. The

same property holds for T_{38} if $\lim_{t \rightarrow \infty} (b_{38}'')^{(7)}((G_{39})(t), t) = (b_{38}')^{(7)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

$$-(\sigma_2)^{(2)} \leq -(a'_{16})^{(2)} + (a'_{17})^{(2)} - (a''_{16})^{(2)}(T_{17}, t) + (a''_{17})^{(2)}(T_{17}, t) \leq -(\sigma_1)^{(2)} \quad 391$$

$$-(\tau_2)^{(2)} \leq -(b'_{16})^{(2)} + (b'_{17})^{(2)} - (b''_{16})^{(2)}((G_{19}), t) - (b''_{17})^{(2)}((G_{19}), t) \leq -(\tau_1)^{(2)} \quad 392$$

Definition of $(v_1)^{(2)}, (v_2)^{(2)}, (u_1)^{(2)}, (u_2)^{(2)}$: 393

By $(v_1)^{(2)} > 0, (v_2)^{(2)} < 0$ and respectively $(u_1)^{(2)} > 0, (u_2)^{(2)} < 0$ the roots 394

(a) of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0$ 395

and $(b_{14})^{(2)}(u^{(2)})^2 + (\tau_1)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ and 396

roots of the equations $(a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} = 0$

and $(b_{37})^{(7)}(u^{(7)})^2 + (\tau_2)^{(7)}u^{(7)} - (b_{36})^{(7)} = 0$

Definition of $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}, (v_0)^{(7)}$:-

(o) If we define $(m_1)^{(7)}, (m_2)^{(7)}, (\mu_1)^{(7)}, (\mu_2)^{(7)}$ by

$$(m_2)^{(7)} = (v_0)^{(7)}, (m_1)^{(7)} = (v_1)^{(7)}, \text{ if } (v_0)^{(7)} < (v_1)^{(7)}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (\bar{v}_1)^{(7)}, \text{ if } (v_1)^{(7)} < (v_0)^{(7)} < (\bar{v}_1)^{(7)},$$

$$\text{and } (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0}$$

$$(m_2)^{(7)} = (v_1)^{(7)}, (m_1)^{(7)} = (v_0)^{(7)}, \text{ if } (\bar{v}_1)^{(7)} < (v_0)^{(7)}$$

and analogously

$$(\mu_2)^{(7)} = (u_0)^{(7)}, (\mu_1)^{(7)} = (u_1)^{(7)}, \text{ if } (u_0)^{(7)} < (u_1)^{(7)}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (\bar{u}_1)^{(7)}, \text{ if } (u_1)^{(7)} < (u_0)^{(7)} < (\bar{u}_1)^{(7)},$$

$$\text{and } (u_0)^{(7)} = \frac{T_{36}^0}{T_{37}^0}$$

$$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (u_0)^{(7)}, \text{ if } (\bar{u}_1)^{(7)} < (u_0)^{(7)} \text{ where } (u_1)^{(7)}, (\bar{u}_1)^{(7)}$$

are defined respectively

Then the solution satisfies the inequalities

$$G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{36}(t) \leq G_{36}^0 e^{(S_1)^{(7)}t}$$

where $(p_i)^{(7)}$ is defined

$$\frac{1}{(m_7)^{(7)}} G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{37}(t) \leq \frac{1}{(m_2)^{(7)}} G_{36}^0 e^{(S_1)^{(7)}t}$$

(

$$\frac{(a_{38})^{(7)} G_{36}^0}{(m_1)^{(7)}((S_1)^{(7)} - (p_{36})^{(7)} - (S_2)^{(7)})} \left[e^{((S_1)^{(7)} - (p_{36})^{(7)})t} - e^{-(S_2)^{(7)}t} \right] + G_{38}^0 e^{-(S_2)^{(7)}t} \leq G_{38}(t) \leq$$

$$\frac{(a_{38})^{(7)} G_{36}^0}{(m_2)^{(7)}((S_1)^{(7)} - (a_{38})^{(7)})} \left[e^{(S_1)^{(7)}t} - e^{-(a_{38})^{(7)}t} \right] + G_{38}^0 e^{-(a_{38})^{(7)}t}$$

$$\frac{T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{1}{(\mu_1)^{(7)}} T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq \frac{1}{(\mu_2)^{(7)}} T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{(b_{38})^{(7)} T_{36}^0}{(\mu_1)^{(7)}((R_1)^{(7)} - (b_{38})^{(7)})} \left[e^{(R_1)^{(7)}t} - e^{-(b_{38})^{(7)}t} \right] + T_{38}^0 e^{-(b_{38})^{(7)}t} \leq T_{38}(t) \leq$$

$$\frac{(a_{38})^{(7)} T_{36}^0}{(\mu_2)^{(7)}((R_1)^{(7)} + (r_{36})^{(7)} + (R_2)^{(7)})} \left[e^{((R_1)^{(7)} + (r_{36})^{(7)})t} - e^{-(R_2)^{(7)}t} \right] + T_{38}^0 e^{-(R_2)^{(7)}t}$$

Definition of $(S_1)^{(7)}, (S_2)^{(7)}, (R_1)^{(7)}, (R_2)^{(7)}$:-

$$\text{Where } (S_1)^{(7)} = (a_{36})^{(7)}(m_2)^{(7)} - (a'_{36})^{(7)}$$

$$(S_2)^{(7)} = (a_{38})^{(7)} - (p_{38})^{(7)}$$

$$(R_1)^{(7)} = (b_{36})^{(7)}(\mu_2)^{(7)} - (b'_{36})^{(7)}$$

$$(R_2)^{(7)} = (b_{38})^{(7)} - (r_{38})^{(7)}$$

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37}, t) \right) -$$

Definition of $v^{(7)}$:-
$$v^{(7)} = \frac{G_{36}}{G_{37}}$$

It follows

$$- \left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)} \right) \leq \frac{dv^{(7)}}{dt} \leq - \left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

(a) For $0 < \left(v_0 \right)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \geq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}, \quad (C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}$$

it follows $(v_0)^{(7)} \leq v^{(7)}(t) \leq (v_1)^{(7)}$

In the same manner , we get

493

$$v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}, \quad (\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}$$

From which we deduce $(v_0)^{(7)} \leq v^{(7)}(t) \leq (\bar{v}_1)^{(7)}$

(b) If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{v}_1)^{(7)}$ we find like in the previous case,

494

$$(v_1)^{(7)} \leq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (\bar{v}_1)^{(7)}$$

(c) If $0 < (v_1)^{(7)} \leq (\bar{v}_1)^{(7)} \leq \left(v_0 \right)^{(7)} = \frac{G_{36}^0}{G_{37}^0}$, we obtain

495

$$(v_1)^{(7)} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (v_0)^{(7)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:-

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{36}'')^{(7)} = (a_{37}'')^{(7)}$, then $(\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(v_1)^{(7)} = (\bar{v}_1)^{(7)}$ if in addition $(v_0)^{(7)} = (v_1)^{(7)}$ then $v^{(7)}(t) = (v_0)^{(7)}$ and as a consequence $G_{36}(t) = (v_0)^{(7)}G_{37}(t)$ **this also defines $(v_0)^{(7)}$ for the special case .**

Analogously if $(b_{36}'')^{(7)} = (b_{37}'')^{(7)}$, then $(\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then

$(u_1)^{(7)} = (\bar{u}_1)^{(7)}$ if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(v_1)^{(7)}$ and $(\bar{v}_1)^{(7)}$, **and definition of $(u_0)^{(7)}$.**

We can prove the following

If $(a_i'')^{(7)}$ and $(b_i'')^{(7)}$ are independent on t , and the conditions

$$(a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} < 0$$

$$(a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a_{36})^{(7)}(p_{36})^{(7)} + (a'_{37})^{(7)}(p_{37})^{(7)} + (p_{36})^{(7)}(p_{37})^{(7)} > 0$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} > 0,$$

$$(b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - (b'_{36})^{(7)}(r_{37})^{(7)} - (b'_{37})^{(7)}(r_{37})^{(7)} + (r_{36})^{(7)}(r_{37})^{(7)} < 0$$

with $(p_{36})^{(7)}, (r_{37})^{(7)}$ as defined are satisfied, then the system WITH THE SATISFACTION OF THE FOLLOWING PROPERTIES HAS A SOLUTION AS DERIVED BELOW.

Particular case :

If $(a''_{16})^{(2)} = (a''_{17})^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)}G_{17}(t)$

Analogously if $(b''_{16})^{(2)} = (b''_{17})^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)}T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a'_{20})^{(3)} - (a'_{21})^{(3)} + (a''_{20})^{(3)}(T_{21}, t) \right) - (a''_{21})^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)}$$

Definition of $v^{(3)}$:-

$$v^{(3)} = \frac{G_{20}}{G_{21}}$$

It follows

$$- \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)} \right) \leq \frac{dv^{(3)}}{dt} \leq - \left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)} \right)$$

From which one obtains

(a) For $0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}} , \quad (C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}$$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$

In the same manner, we get

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} , \quad (\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}$$

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case,

$$(v_1)^{(3)} \leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (\bar{v}_1)^{(3)}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad \boxed{u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{20})^{(3)} = (a''_{21})^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)}G_{21}(t)$

Analogously if $(b''_{20})^{(3)} = (b''_{21})^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$

506

: From GLOBAL EQUATIONS we obtain

507

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25}, t) \right) - (a''_{25})^{(4)}(T_{25}, t)v^{(4)} - (a_{25})^{(4)}v^{(4)}$$

Definition of $v^{(4)}$:-

$$\boxed{v^{(4)} = \frac{G_{24}}{G_{25}}}$$

508

It follows

$$- \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_2)^{(4)}v^{(4)} - (a_{24})^{(4)} \right) \leq \frac{dv^{(4)}}{dt} \leq - \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_4)^{(4)}v^{(4)} - (a_{24})^{(4)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \boxed{(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}} < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}}{4 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}} , \quad \boxed{(C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}}$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner , we get

509

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{4 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} , \quad \boxed{(\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}}$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case,

510

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}}{1 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}} \leq v^{(4)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (\bar{v}_1)^{(4)}$$

511

512

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \boxed{(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0}}$, we obtain

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(4)}(t)$:-

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)}, \quad \boxed{v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t)$:-

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{24})^{(4)} = (a''_{25})^{(4)}$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case .** 513

Analogously if $(b''_{24})^{(4)} = (b''_{25})^{(4)}$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then $(u_1)^{(4)} = (\bar{u}_1)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

From GLOBAL EQUATIONS we obtain

514
515

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)}$:- $\boxed{v^{(5)} = \frac{G_{28}}{G_{29}}}$

It follows

$$- \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)} \right) \leq \frac{dv^{(5)}}{dt} \leq - \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)}$:-

(g) For $0 < \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad \boxed{(C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner , we get

516

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{5 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}, \quad \boxed{(\bar{C})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_5)^{(5)}$

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case,

517

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}} \leq v^{(5)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (\bar{v}_1)^{(5)}$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}}$, we obtain

518

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (v_0)^{(5)}$$

519

And so with the notation of the first part of condition (c), we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad \boxed{v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad \boxed{u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{28})^{(5)} = (a''_{29})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)}G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case**.

Analogously if $(b''_{28})^{(5)} = (b''_{29})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then $(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)}T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$** .

520

we obtain

521

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a'_{32})^{(6)} - (a'_{33})^{(6)} + (a''_{32})^{(6)}(T_{33}, t) \right) - (a''_{33})^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $\boxed{v^{(6)} = \frac{G_{32}}{G_{33}}}$

It follows

$$- \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_2)^{(6)}v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_1)^{(6)}v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

(j) For $0 < \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_0)^{(6)}]t}}, \quad \boxed{(C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner, we get

522

523

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}, \quad \boxed{(\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case, 524

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (\bar{C})^{(6)} (v_2)^{(6)} e^{[-(a_{33})^{(6)} (v_1)^{(6)} - (v_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (v_1)^{(6)} - (v_2)^{(6)}] t}} \leq v^{(6)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}} \leq (\bar{v}_1)^{(6)}$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}$, we obtain 525

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)} (\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)} (\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}] t}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)}, \quad \boxed{v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)}, \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{32})^{(6)} = (a_{33})^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)} G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b_{32})^{(6)} = (b_{33})^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then $(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)} T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

526

Behavior of the solutions

527

If we denote and define

Definition of $(\sigma_1)^{(7)}, (\sigma_2)^{(7)}, (\tau_1)^{(7)}, (\tau_2)^{(7)}$:

(p) $(\sigma_1)^{(7)}, (\sigma_2)^{(7)}, (\tau_1)^{(7)}, (\tau_2)^{(7)}$ four constants satisfying

$$-(\sigma_2)^{(7)} \leq -(a'_{36})^{(7)} + (a'_{37})^{(7)} - (a''_{36})^{(7)}(T_{37}, t) + (a''_{37})^{(7)}(T_{37}, t) \leq -(\sigma_1)^{(7)}$$

$$-(\tau_2)^{(7)} \leq -(b'_{36})^{(7)} + (b'_{37})^{(7)} - (b''_{36})^{(7)}((G_{39}), t) - (b''_{37})^{(7)}((G_{39}), t) \leq -(\tau_1)^{(7)}$$

$$\text{and } (u_0)^{(7)} = \frac{T_{36}^0}{T_{37}^0}$$

$(\mu_2)^{(7)} = (u_1)^{(7)}, (\mu_1)^{(7)} = (u_0)^{(7)}$, if $(\bar{u}_1)^{(7)} < (u_0)^{(7)}$ where $(u_1)^{(7)}, (\bar{u}_1)^{(7)}$ are defined by 59 and 67 respectively

Then the solution of GLOBAL EQUATIONS satisfies the inequalities

$$G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{36}(t) \leq G_{36}^0 e^{(S_1)^{(7)}t}$$

where $(p_i)^{(7)}$ is defined

$$\frac{1}{(m_7)^{(7)}} G_{36}^0 e^{((S_1)^{(7)} - (p_{36})^{(7)})t} \leq G_{37}(t) \leq \frac{1}{(m_2)^{(7)}} G_{36}^0 e^{(S_1)^{(7)}t}$$

$$\left(\frac{(a_{38})^{(7)} G_{36}^0}{(m_1)^{(7)}((S_1)^{(7)} - (p_{36})^{(7)} - (S_2)^{(7)})} \left[e^{((S_1)^{(7)} - (p_{36})^{(7)})t} - e^{-(S_2)^{(7)}t} \right] + G_{38}^0 e^{-(S_2)^{(7)}t} \leq G_{38}(t) \leq \frac{(a_{38})^{(7)} G_{36}^0}{(m_2)^{(7)}((S_1)^{(7)} - (a'_{38})^{(7)})} \left[e^{(S_1)^{(7)}t} - e^{-(a'_{38})^{(7)}t} \right] + G_{38}^0 e^{-(a'_{38})^{(7)}t} \right)$$

$$\boxed{T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{1}{(\mu_1)^{(7)}} T_{36}^0 e^{(R_1)^{(7)}t} \leq T_{36}(t) \leq \frac{1}{(\mu_2)^{(7)}} T_{36}^0 e^{((R_1)^{(7)} + (r_{36})^{(7)})t}$$

$$\frac{(b_{38})^{(7)} T_{36}^0}{(\mu_1)^{(7)}((R_1)^{(7)} - (b_{38})^{(7)})} \left[e^{(R_1)^{(7)}t} - e^{-(b'_{38})^{(7)}t} \right] + T_{38}^0 e^{-(b'_{38})^{(7)}t} \leq T_{38}(t) \leq$$

$$\frac{(a_{38})^{(7)} T_{36}^0}{(\mu_2)^{(7)}((R_1)^{(7)} + (r_{36})^{(7)} + (R_2)^{(7)})} \left[e^{((R_1)^{(7)} + (r_{36})^{(7)})t} - e^{-(R_2)^{(7)}t} \right] + T_{38}^0 e^{-(R_2)^{(7)}t}$$

Definition of $(S_1)^{(7)}, (S_2)^{(7)}, (R_1)^{(7)}, (R_2)^{(7)}$:-

Where $(S_1)^{(7)} = (a_{36})^{(7)}(m_2)^{(7)} - (a'_{36})^{(7)}$

$$\begin{aligned} (S_2)^{(7)} &= (a_{38})^{(7)} - (p_{38})^{(7)} \\ (R_1)^{(7)} &= (b_{36})^{(7)}(\mu_2)^{(7)} - (b'_{36})^{(7)} \\ (R_2)^{(7)} &= (b_{38})^{(7)} - (r_{38})^{(7)} \end{aligned}$$

From CONCATENATED GLOBAL EQUATIONS we obtain

$$\frac{dv^{(7)}}{dt} = (a_{36})^{(7)} - \left((a'_{36})^{(7)} - (a'_{37})^{(7)} + (a''_{36})^{(7)}(T_{37}, t) \right) - (a''_{37})^{(7)}(T_{37}, t)v^{(7)} - (a_{37})^{(7)}v^{(7)}$$

Definition of $v^{(7)}$:-
$$v^{(7)} = \frac{G_{36}}{G_{37}}$$

It follows

$$-\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_2)^{(7)}v^{(7)} - (a_{36})^{(7)}\right) \leq \frac{dv^{(7)}}{dt} \leq -\left((a_{37})^{(7)}(v^{(7)})^2 + (\sigma_1)^{(7)}v^{(7)} - (a_{36})^{(7)}\right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(7)}, (v_0)^{(7)}$:-

(m) For $0 < \frac{G_{36}^0}{G_{37}^0} < (v_1)^{(7)} < (\bar{v}_1)^{(7)}$

$$v^{(7)}(t) \geq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_0)^{(7)}]t}}, \quad (C)^{(7)} = \frac{(v_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (v_2)^{(7)}}$$

it follows $(v_0)^{(7)} \leq v^{(7)}(t) \leq (v_1)^{(7)}$

In the same manner, we get

$$v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}, \quad (\bar{C})^{(7)} = \frac{(\bar{v}_1)^{(7)} - (v_0)^{(7)}}{(v_0)^{(7)} - (\bar{v}_2)^{(7)}}$$

541

From which we deduce $(v_0)^{(7)} \leq v^{(7)}(t) \leq (\bar{v}_1)^{(7)}$

(n) If $0 < (v_1)^{(7)} < (v_0)^{(7)} = \frac{G_{36}^0}{G_{37}^0} < (\bar{v}_1)^{(7)}$ we find like in the previous case,

542

$$(v_1)^{(7)} \leq \frac{(v_1)^{(7)} + (C)^{(7)}(v_2)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}}{1 + (C)^{(7)} e^{[-(a_{37})^{(7)}(v_1)^{(7)} - (v_2)^{(7)}]t}} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (\bar{v}_1)^{(7)}$$

(o) If $0 < (v_1)^{(7)} \leq (\bar{v}_1)^{(7)} \leq \frac{G_{36}^0}{G_{37}^0}$, we obtain

543

$$(v_1)^{(7)} \leq v^{(7)}(t) \leq \frac{(\bar{v}_1)^{(7)} + (\bar{C})^{(7)}(\bar{v}_2)^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}}{1 + (\bar{C})^{(7)} e^{[-(a_{37})^{(7)}(\bar{v}_1)^{(7)} - (\bar{v}_2)^{(7)}]t}} \leq (v_0)^{(7)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(7)}(t)$:-

$$(m_2)^{(7)} \leq v^{(7)}(t) \leq (m_1)^{(7)}, \quad v^{(7)}(t) = \frac{G_{36}(t)}{G_{37}(t)}$$

In a completely analogous way, we obtain

Definition of $u^{(7)}(t)$:-

$$(\mu_2)^{(7)} \leq u^{(7)}(t) \leq (\mu_1)^{(7)}, \quad u^{(7)}(t) = \frac{T_{36}(t)}{T_{37}(t)}$$

Now, using this result and replacing it in CONCATENATED GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{36})^{(7)} = (a_{37})^{(7)}$, then $(\sigma_1)^{(7)} = (\sigma_2)^{(7)}$ and in this case $(v_1)^{(7)} = (\bar{v}_1)^{(7)}$ if in addition $(v_0)^{(7)} = (v_1)^{(7)}$ then $v^{(7)}(t) = (v_0)^{(7)}$ and as a consequence $G_{36}(t) = (v_0)^{(7)}G_{37}(t)$ **this also defines $(v_0)^{(7)}$ for the special case.**

Analogously if $(b_{36})^{(7)} = (b_{37})^{(7)}$, then $(\tau_1)^{(7)} = (\tau_2)^{(7)}$ and then

$(u_1)^{(7)} = (\bar{u}_1)^{(7)}$ if in addition $(u_0)^{(7)} = (u_1)^{(7)}$ then $T_{36}(t) = (u_0)^{(7)}T_{37}(t)$ This is an important consequence of the relation between $(v_1)^{(7)}$ and $(\bar{v}_1)^{(7)}$, **and definition of $(u_0)^{(7)}$.**

$$(b_{14})^{(1)}T_{13} - [(b'_{14})^{(1)} - (b''_{14})^{(1)}(G)]T_{14} = 0$$

544

$$(b_{15})^{(1)}T_{14} - [(b'_{15})^{(1)} - (b''_{15})^{(1)}(G)]T_{15} = 0$$

545

has a unique positive solution, which is an equilibrium solution for the system

546

$$(b_{38})^{(7)}T_{37} - [(b'_{38})^{(7)} - (b''_{38})^{(7)}(G_{39})]T_{38} = 0 \quad 589$$

has a unique positive solution , which is an equilibrium solution for the system 560

(a) Indeed the first two equations have a nontrivial solution G_{36}, G_{37} if

$$F(T_{39}) = (a'_{36})^{(7)}(a'_{37})^{(7)} - (a_{36})^{(7)}(a_{37})^{(7)} + (a'_{36})^{(7)}(a''_{37})^{(7)}(T_{37}) + (a'_{37})^{(7)}(a''_{36})^{(7)}(T_{37}) + (a_{36})^{(7)}(T_{37})(a''_{37})^{(7)}(T_{37}) = 0$$

Definition and uniqueness of T_{37}^* :- 561

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(7)}(T_{37})$ being increasing, it follows that there exists a unique T_{37}^* for which $f(T_{37}^*) = 0$. With this value , we obtain from the three first equations

$$G_{36} = \frac{(a_{36})^{(7)}G_{37}}{[(a'_{36})^{(7)} + (a_{36})^{(7)}(T_{37}^*)]} , \quad G_{38} = \frac{(a_{38})^{(7)}G_{37}}{[(a'_{38})^{(7)} + (a_{38})^{(7)}(T_{37}^*)]}$$

(e) By the same argument, the equations(SOLUTIONAL) admit solutions G_{36}, G_{37} if

$$\varphi(G_{39}) = (b'_{36})^{(7)}(b'_{37})^{(7)} - (b_{36})^{(7)}(b_{37})^{(7)} - [(b'_{36})^{(7)}(b''_{37})^{(7)}(G_{39}) + (b'_{37})^{(7)}(b''_{36})^{(7)}(G_{39})] + (b''_{36})^{(7)}(G_{39})(b''_{37})^{(7)}(G_{39}) = 0$$

Where in $(G_{39})(G_{36}, G_{37}, G_{38}), G_{36}, G_{38}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{37} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{37}^* such that $\varphi(G^*) = 0$ 562

Finally we obtain the unique solution OF THE SYSTEM

G_{37}^* given by $\varphi((G_{39})^*) = 0, T_{37}^*$ given by $f(T_{37}^*) = 0$ and

$$G_{36}^* = \frac{(a_{36})^{(7)}G_{37}^*}{[(a'_{36})^{(7)} + (a_{36})^{(7)}(T_{37}^*)]} , \quad G_{38}^* = \frac{(a_{38})^{(7)}G_{37}^*}{[(a'_{38})^{(7)} + (a_{38})^{(7)}(T_{37}^*)]}$$

$$T_{36}^* = \frac{(b_{36})^{(7)}T_{37}^*}{[(b'_{36})^{(7)} - (b_{36})^{(7)}((G_{39})^*)]} , \quad T_{38}^* = \frac{(b_{38})^{(7)}T_{37}^*}{[(b'_{38})^{(7)} - (b_{38})^{(7)}((G_{39})^*)]} \quad 563$$

Definition and uniqueness of T_{21}^* :- 564

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(1)}(T_{21})$ being increasing, it follows that there exists a unique T_{21}^* for which $f(T_{21}^*) = 0$. With this value , we obtain from the three first equations

$$G_{20} = \frac{(a_{20})^{(3)}G_{21}}{[(a'_{20})^{(3)} + (a_{20})^{(3)}(T_{21}^*)]} , \quad G_{22} = \frac{(a_{22})^{(3)}G_{21}}{[(a'_{22})^{(3)} + (a_{22})^{(3)}(T_{21}^*)]}$$

Definition and uniqueness of T_{25}^* :- 566

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(4)}(T_{25})$ being increasing, it follows that there exists a unique T_{25}^* for which $f(T_{25}^*) = 0$. With this value , we obtain from the three first equations

$$G_{24} = \frac{(a_{24})^{(4)}G_{25}}{[(a'_{24})^{(4)} + (a_{24})^{(4)}(T_{25}^*)]} , \quad G_{26} = \frac{(a_{26})^{(4)}G_{25}}{[(a'_{26})^{(4)} + (a_{26})^{(4)}(T_{25}^*)]}$$

Definition and uniqueness of T_{29}^* :- 567

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(5)}(T_{29})$ being increasing, it follows that there exists a unique T_{29}^* for which $f(T_{29}^*) = 0$. With this value , we obtain from the three first equations

$$G_{28} = \frac{(a_{28})^{(5)}G_{29}}{[(a'_{28})^{(5)} + (a_{28})^{(5)}(T_{29}^*)]} , \quad G_{30} = \frac{(a_{30})^{(5)}G_{29}}{[(a'_{30})^{(5)} + (a_{30})^{(5)}(T_{29}^*)]}$$

Definition and uniqueness of T_{33}^* :- 568

After hypothesis $f(0) < 0, f(\infty) > 0$ and the functions $(a_i'')^{(6)}(T_{33})$ being increasing, it follows that there exists a unique T_{33}^* for which $f(T_{33}^*) = 0$. With this value , we obtain from the three first equations

$$G_{32} = \frac{(a_{32})^{(6)}G_{33}}{[(a'_{32})^{(6)}+(a''_{32})^{(6)}(T_{33}^*)]} , \quad G_{34} = \frac{(a_{34})^{(6)}G_{33}}{[(a'_{34})^{(6)}+(a''_{34})^{(6)}(T_{33}^*)]}$$

(f) By the same argument, the equations 92,93 admit solutions G_{13}, G_{14} if 569

$$\varphi(G) = (b'_{13})^{(1)}(b'_{14})^{(1)} - (b''_{13})^{(1)}(b''_{14})^{(1)} - [(b'_{13})^{(1)}(b''_{14})^{(1)}(G) + (b'_{14})^{(1)}(b''_{13})^{(1)}(G)] + (b''_{13})^{(1)}(G)(b''_{14})^{(1)}(G) = 0$$

Where in $G(G_{13}, G_{14}, G_{15}), G_{13}, G_{15}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{14} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{14}^* such that $\varphi(G^*) = 0$

(g) By the same argument, the equations 92,93 admit solutions G_{16}, G_{17} if 570

$$\varphi(G_{19}) = (b'_{16})^{(2)}(b'_{17})^{(2)} - (b''_{16})^{(2)}(b''_{17})^{(2)} - [(b'_{16})^{(2)}(b''_{17})^{(2)}(G_{19}) + (b'_{17})^{(2)}(b''_{16})^{(2)}(G_{19})] + (b''_{16})^{(2)}(G_{19})(b''_{17})^{(2)}(G_{19}) = 0$$

Where in $(G_{19})(G_{16}, G_{17}, G_{18}), G_{16}, G_{18}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{17} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{17}^* such that $\varphi((G_{19})^*) = 0$ 571

(a) By the same argument, the concatenated equations admit solutions G_{20}, G_{21} if 572

$$\varphi(G_{23}) = (b'_{20})^{(3)}(b'_{21})^{(3)} - (b''_{20})^{(3)}(b''_{21})^{(3)} - [(b'_{20})^{(3)}(b''_{21})^{(3)}(G_{23}) + (b'_{21})^{(3)}(b''_{20})^{(3)}(G_{23})] + (b''_{20})^{(3)}(G_{23})(b''_{21})^{(3)}(G_{23}) = 0$$

Where in $G_{23}(G_{20}, G_{21}, G_{22}), G_{20}, G_{22}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{21} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{21}^* such that $\varphi((G_{23})^*) = 0$ 573

(b) By the same argument, the equations of modules admit solutions G_{24}, G_{25} if 574

$$\varphi(G_{27}) = (b'_{24})^{(4)}(b'_{25})^{(4)} - (b''_{24})^{(4)}(b''_{25})^{(4)} - [(b'_{24})^{(4)}(b''_{25})^{(4)}(G_{27}) + (b'_{25})^{(4)}(b''_{24})^{(4)}(G_{27})] + (b''_{24})^{(4)}(G_{27})(b''_{25})^{(4)}(G_{27}) = 0$$

Where in $(G_{27})(G_{24}, G_{25}, G_{26}), G_{24}, G_{26}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{25} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{25}^* such that $\varphi((G_{27})^*) = 0$

(c) By the same argument, the equations (modules) admit solutions G_{28}, G_{29} if 575

$$\varphi(G_{31}) = (b'_{28})^{(5)}(b'_{29})^{(5)} - (b''_{28})^{(5)}(b''_{29})^{(5)} - [(b'_{28})^{(5)}(b''_{29})^{(5)}(G_{31}) + (b'_{29})^{(5)}(b''_{28})^{(5)}(G_{31})] + (b''_{28})^{(5)}(G_{31})(b''_{29})^{(5)}(G_{31}) = 0$$

Where in $(G_{31})(G_{28}, G_{29}, G_{30}), G_{28}, G_{30}$ must be replaced by their values from 96. It is easy to see that φ is a decreasing function in G_{29} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{29}^* such that $\varphi((G_{31})^*) = 0$

(d) By the same argument, the equations (modules) admit solutions G_{32}, G_{33} if 578

$$\varphi(G_{35}) = (b'_{32})^{(6)}(b'_{33})^{(6)} - (b''_{32})^{(6)}(b''_{33})^{(6)} - [(b'_{32})^{(6)}(b''_{33})^{(6)}(G_{35}) + (b'_{33})^{(6)}(b''_{32})^{(6)}(G_{35})] + (b''_{32})^{(6)}(G_{35})(b''_{33})^{(6)}(G_{35}) = 0$$

Where in $(G_{35})(G_{32}, G_{33}, G_{34}), G_{32}, G_{34}$ must be replaced by their values It is easy to see that φ is a decreasing function in G_{33} taking into account the hypothesis $\varphi(0) > 0, \varphi(\infty) < 0$ it follows that there exists a unique G_{33}^* such that $\varphi(G^*) = 0$ 580
581

Finally we obtain the unique solution of 89 to 94 582

G_{14}^* given by $\varphi(G^*) = 0, T_{14}^*$ given by $f(T_{14}^*) = 0$ and

$$G_{13}^* = \frac{(a_{13})^{(1)}G_{14}^*}{[(a'_{13})^{(1)}+(a''_{13})^{(1)}(T_{14}^*)]} , \quad G_{15}^* = \frac{(a_{15})^{(1)}G_{14}^*}{[(a'_{15})^{(1)}+(a''_{15})^{(1)}(T_{14}^*)]}$$

$$T_{13}^* = \frac{(b_{13})^{(1)}T_{14}^*}{[(b'_{13})^{(1)}-(b''_{13})^{(1)}(G^*)]} , \quad T_{15}^* = \frac{(b_{15})^{(1)}T_{14}^*}{[(b'_{15})^{(1)}-(b''_{15})^{(1)}(G^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution 583

G_{17}^* given by $\varphi((G_{19})^*) = 0, T_{17}^*$ given by $f(T_{17}^*) = 0$ and 584

$$G_{16}^* = \frac{(a_{16})^{(2)}G_{17}^*}{[(a'_{16})^{(2)}+(a''_{16})^{(2)}(T_{17}^*)]} , \quad G_{18}^* = \frac{(a_{18})^{(2)}G_{17}^*}{[(a'_{18})^{(2)}+(a''_{18})^{(2)}(T_{17}^*)]}$$

$$T_{16}^* = \frac{(b_{16})^{(2)}T_{17}^*}{[(b'_{16})^{(2)}-(b''_{16})^{(2)}((G_{19})^*)]} , \quad T_{18}^* = \frac{(b_{18})^{(2)}T_{17}^*}{[(b'_{18})^{(2)}-(b''_{18})^{(2)}((G_{19})^*)]}$$

Obviously, these values represent an equilibrium solution 587

Finally we obtain the unique solution 588

G_{21}^* given by $\varphi((G_{23})^*) = 0, T_{21}^*$ given by $f(T_{21}^*) = 0$ and

$$G_{20}^* = \frac{(a_{20})^{(3)}G_{21}^*}{[(a'_{20})^{(3)}+(a''_{20})^{(3)}(T_{21}^*)]} , \quad G_{22}^* = \frac{(a_{22})^{(3)}G_{21}^*}{[(a'_{22})^{(3)}+(a''_{22})^{(3)}(T_{21}^*)]}$$

$$T_{20}^* = \frac{(b_{20})^{(3)}T_{21}^*}{[(b_{20})^{(3)} - (b_{20}'')^{(3)}(G_{23}^*)]} , T_{22}^* = \frac{(b_{22})^{(3)}T_{21}^*}{[(b_{22})^{(3)} - (b_{22}'')^{(3)}(G_{23}^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{25}^* given by $\varphi(G_{27}) = 0$, T_{25}^* given by $f(T_{25}^*) = 0$ and

$$G_{24}^* = \frac{(a_{24})^{(4)}G_{25}^*}{[(a_{24})^{(4)} + (a_{24}'')^{(4)}(T_{25}^*)]} , G_{26}^* = \frac{(a_{26})^{(4)}G_{25}^*}{[(a_{26})^{(4)} + (a_{26}'')^{(4)}(T_{25}^*)]}$$

$$T_{24}^* = \frac{(b_{24})^{(4)}T_{25}^*}{[(b_{24})^{(4)} - (b_{24}'')^{(4)}((G_{27})^*)]} , T_{26}^* = \frac{(b_{26})^{(4)}T_{25}^*}{[(b_{26})^{(4)} - (b_{26}'')^{(4)}((G_{27})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{29}^* given by $\varphi((G_{31})^*) = 0$, T_{29}^* given by $f(T_{29}^*) = 0$ and

$$G_{28}^* = \frac{(a_{28})^{(5)}G_{29}^*}{[(a_{28})^{(5)} + (a_{28}'')^{(5)}(T_{29}^*)]} , G_{30}^* = \frac{(a_{30})^{(5)}G_{29}^*}{[(a_{30})^{(5)} + (a_{30}'')^{(5)}(T_{29}^*)]}$$

$$T_{28}^* = \frac{(b_{28})^{(5)}T_{29}^*}{[(b_{28})^{(5)} - (b_{28}'')^{(5)}((G_{31})^*)]} , T_{30}^* = \frac{(b_{30})^{(5)}T_{29}^*}{[(b_{30})^{(5)} - (b_{30}'')^{(5)}((G_{31})^*)]}$$

Obviously, these values represent an equilibrium solution

Finally we obtain the unique solution

G_{33}^* given by $\varphi((G_{35})^*) = 0$, T_{33}^* given by $f(T_{33}^*) = 0$ and

$$G_{32}^* = \frac{(a_{32})^{(6)}G_{33}^*}{[(a_{32})^{(6)} + (a_{32}'')^{(6)}(T_{33}^*)]} , G_{34}^* = \frac{(a_{34})^{(6)}G_{33}^*}{[(a_{34})^{(6)} + (a_{34}'')^{(6)}(T_{33}^*)]}$$

$$T_{32}^* = \frac{(b_{32})^{(6)}T_{33}^*}{[(b_{32})^{(6)} - (b_{32}'')^{(6)}((G_{35})^*)]} , T_{34}^* = \frac{(b_{34})^{(6)}T_{33}^*}{[(b_{34})^{(6)} - (b_{34}'')^{(6)}((G_{35})^*)]}$$

Obviously, these values represent an equilibrium solution

ASYMPTOTIC STABILITY ANALYSIS

Theorem 4: If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ Belong to $C^{(1)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable.

Proof: Denote

Definition of G_i, T_i :-

$$G_i = G_i^* + G_i , T_i = T_i^* + T_i$$

$$\frac{\partial (a_{14}'')^{(1)}}{\partial T_{14}}(T_{14}^*) = (q_{14})^{(1)} , \frac{\partial (b_i'')^{(1)}}{\partial G_j}(G^*) = s_{ij}$$

Then taking into account equations (global) and neglecting the terms of power 2, we obtain

$$\frac{dG_{13}}{dt} = -((a_{13}')^{(1)} + (p_{13})^{(1)})G_{13} + (a_{13})^{(1)}G_{14} - (q_{13})^{(1)}G_{13}^*T_{14}$$

$$\frac{dG_{14}}{dt} = -((a_{14}')^{(1)} + (p_{14})^{(1)})G_{14} + (a_{14})^{(1)}G_{13} - (q_{14})^{(1)}G_{14}^*T_{14}$$

$$\frac{dG_{15}}{dt} = -((a_{15}')^{(1)} + (p_{15})^{(1)})G_{15} + (a_{15})^{(1)}G_{14} - (q_{15})^{(1)}G_{15}^*T_{14}$$

$$\frac{dT_{13}}{dt} = -((b_{13}')^{(1)} - (r_{13})^{(1)})T_{13} + (b_{13})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(13)(j)})T_{13}^*G_j$$

$$\frac{dT_{14}}{dt} = -((b_{14}')^{(1)} - (r_{14})^{(1)})T_{14} + (b_{14})^{(1)}T_{13} + \sum_{j=13}^{15} (s_{(14)(j)})T_{14}^*G_j$$

$$\frac{dT_{15}}{dt} = -((b_{15}')^{(1)} - (r_{15})^{(1)})T_{15} + (b_{15})^{(1)}T_{14} + \sum_{j=13}^{15} (s_{(15)(j)})T_{15}^*G_j$$

If the conditions of the previous theorem are satisfied and if the functions $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ Belong to $C^{(2)}(\mathbb{R}_+)$ then the above equilibrium point is asymptotically stable

Denote

(13)[^] Note that the relativistic mass, in contrast to the rest mass m_0 , is not a relativistic invariant, and that the velocity is not a Minkowski four-vector, in contrast to the quantity dx^μ , where dx^μ is the differential of the proper time. However, the energy-momentum four-vector is a genuine Minkowski four-vector, and the intrinsic origin of the square-root in the definition of the relativistic mass is the distinction between $d\tau$ and dt .

(26)[^] There is usually more than one possible way to define a field energy, because any field can be made to couple to gravity in many different ways. By general scaling arguments, the correct answer at everyday distances, which are long compared to the quantum gravity scale, should be *minimal coupling*, which means that no powers of the curvature tensor appear. Any non-minimal couplings, along with other higher order terms, are presumably only determined by a theory of quantum gravity, and within string theory, they only start to contribute to experiments at the string scale.

Stamford, CT - 06902, USA,

ABSTRACT: The thermal degradation and fractional distillation process applied with polypropylene (PP) of waste plastic using stainless steel reactor without using any kind of catalyst. The polymer has been selected for the experiment 100% by weight and 1% activated carbon was used. The experimental temperature was used for thermal degradation liquefaction process at 100-400 °C and fractional distillation for third fraction fuel or aviation/kerosene/jet category fuel collection temperature was 180-210 °C and overall experiment run time was 6-6.30 hours. The obtained products density is 0.75 g/ml and production yield percentage are third fraction liquid fuel or aviation/kerosene/jet category fuel yield is 30.40%, other fraction fuel percentage was 62.60% light gas 3% and black carbon residue 4%. Various techniques (Gas Chromatography and Mass Spectrometer, FT-IR and DSC) were used for produced third fraction fuel or aviation/kerosene/jet category fractional fuel analysis purpose. GC/MS result is showing that hydrocarbon compound ranges in this fuel are C₈-C₁₉ and light gas are present hydrocarbon range C₁-C₄. Third fractional fuel or kerosene / jet / aviation category fuel analysis results is showing different carbon range and produced third fractional fuel present short chain to long chain hydrocarbon like alkane and alkene group. Produce fuel can be use for internal combustion engine or electricity generation or feed stock refinery process.

Keywords: PP, waste plastic, kerosene, fuel, activated carbon, GC/MS, polypropylene

I. INTRODUCTION

Solving the problem of waste materials such as used plastics, waste tires, and waste oils is undoubtedly a major challenge being faced in all the countries of the world to maintain the sustainable and environmentally compatible economic growth. One of the major problems caused in the recycling of waste plastics is the in homogeneity of the polymers in the waste. Actually, different types of polymers (polyethylene (PE), polypropylene (PP), polystyrene (PS), polyethylene terephthalate (PET), polyvinyl chloride (PVC), acrylonitrile-butadiene-styrene (ABS) and etc.) can be present in waste plastic mixture. Especially, co-processing of co-mingled waste plastics with waste motor oils through a tertiary recycling technique [1-4] can achieve the purpose of waste recycling into commercially viable chemicals or fuel oils. The growing amount of plastic waste is generating more and more environmental problems worldwide. The present rate of economic growth is unimaginable without saving of fossil energy like crude oil, natural gas or coal. Suitable waste management is another important aspect of sustainable

development. Plastic wastes represent a considerable part of municipal wastes; furthermore huge amounts of plastic waste arise as a by-product or faulty product in industry and agriculture. According to estimates, plastic wastes represent 15-25% of municipal waste. The amount of plastic materials was 25 Mt in Europe and it will reach 35 Mt by 2010 [5, 6].

Nowadays there are three ways to utilize plastic waste: landfilling, incineration with or without energy recovery and recycling. The largest amount of plastic wastes is disposed of by landfilling (65-70%), and incineration (20-25%), Recycling is only about 10%. At the present time, it is thought that efficient co-processing processes which are feasible in technical and economical aspects should be developed. In parallel with this, an overall national network system [7-10] such as waste plastics collection, pretreatment and regulatory considerations should be provided for successful recycling of waste materials. Korea produces 2.6 million tonnes per annum of thermoplastic wastes of which less than 10% is recycled for the material recovery (primary recycling). In addition, almost 120 million gallons of waste motor oils are generated each year posing severe environmental problems as a result of its metal compounds and high sulfur content (ca. 4000- 6000 ppm wt.) resulting from such additives as dispersants (Copolymer sulfonate), oxidation inhibitors (organic sulfur compounds, aminophenol), corrosion inhibitors (organic amines) and extreme pressure additives and from existing sulfur naturally in lube base stock. In this study, co-processing of waste plastics (HDPE, LDPE, PS, PP, PET and ABS) with waste oil by statistical rotatable pentagonal design experiments in a micro-reactor system (40 ml capacity) were explored to extract the optimum pyrolysis conditions for conversion of each plastic/ waste oil blend into oils [11].

II. MATERIALS & METHOD

PP waste plastic was collected from local city coffee shop and local restaurant. Coffee cup PP waste plastic color was transparent, food container and food container cover was white and black color. PP plastic comes with food particle and left over coffee because we collected PP waste plastic from store. After collection PP waste plastic wash with water and none foaming detergent by using electrical plastic washing machine. After finished wash PP waste plastic make it dry with using same machine at 22 °C temperature. During washing PP waste plastic also generating some waste water that waste water we did not discharge into drainage system because our main goal is waste plastic problem solve from land fill not to create another waste problem. Produced waste water treatment for reuse of waster again waste plastic washing purpose.

This type process is one kind of cyclic process not to generate waste water. Waste water was treated by using chemical and chemical is not harm fuel for human body because we are using only Sodium Hydroxide and Potash Alum. PP waste plastic after dried cut into small pieces manually by using scissor then transfer into grinder machine of grinding and size about 2-3mm. Small pieces grounded PP waste plastic transfer into steel reactor chamber for liquefaction process. Experimental process setup was shown into figure 1. PP waste plastic to kerosene/aviation/jet category fuel production process diagram describe fig.1 and describe figure 1 all number such as 1 = polypropylene waste plastic, 2= Steel reactor, 3 = Fractional distillation column, 4= 1st fraction temperature, 5= 2nd fraction temperature, 6=3rd fraction temperature, 7= 4th fraction temperature, 8= 5th fraction temperature, 9= light gas cleaning system, 10= 1st fraction fuel collection tank, 11=2nd fraction fuel collection tank, 12=3rd fraction fuel collection tank, 13=4th fraction fuel collection tank, 14 = 5th fraction fuel collection tank, 15 = small pump, 16 = Teflon bag for light gas storage. Fuel production process diagram was shown number 12 is aviation/ kerosene/jet fuel collection system. PP waste plastic to fuel production process grounded waste plastic put into reactor chamber and covered by reactor cover and screw tighten properly because we do not want to escape any gas during fuel production period. Condensation with fractional distillation column setup top of reactor with grading temperature wise with electrical coil and temperature was monitor by using watlow company provided watlow meter. For experimental purpose feed was use only 500 gm by weight and activated carbon was use only 1% by weight. In this experiment PP waste plastic to liquefaction temperature used 100 to 400 °C and collection aviation /kerosene/jet category fuel fractional temperature was 180-210 °C. Collection device end part was collected light gas

cleaning device and this device was fill up with alkali solution for removing light gas contamination and water portion which was generated from production. In this experiment did not apply vacuum system and did not apply any kind of catalyst. After finished all set up experimental procedure we start reactor electrical power for heated up PP waste plastic. PP waste plastic start to melt due to heat applies then turns into liquid slurry, liquid slurry turns into gas vapor this gas vapor pass through fractional column based on boiling point temperature at the end collected 3rd fractional or aviation/kerosene/jet grade fuel. In this experiment main goal was aviation/kerosene/jet category fuel collection. Activated carbon help to reduce fuel dye level because when heated up PP waste plastic with activated carbon, activated carbon absorbed plastic additives color and produce fuel made cleaner. PP waste plastic to 3rd fractional fuel or aviation/ kerosene/jet category fuel production period also generate some light gas its call natural gas and this gas hydrocarbon range C₁-C₄. These gases pass through alkali chamber and remove contamination transfer Teflon bag by using small pump for future use. Collected 3rd fractional fuel purified by RCI purification device and removed fuel sediment. Total experiment run time was 6-6.30 hours and input electricity was 6.12 kWh. From this experiment in mass balance calculation indicate that 3rd fractional fuel or aviation/kerosene/jet category fuel conversion 152 gm from 500 gm of initial feed. Light gas converted feed sample 15 gm, solid black residue leftover 20 gm from total feed and rest of other grade fuel generated 313 gm sample during in this experiment. In percentage ratio third fraction liquid fuel or aviation/kerosene/jet category fuel yield percentage is 30.40%, other fraction fuel percentage was 62.60% light gas 3% and black carbon residue 4%.

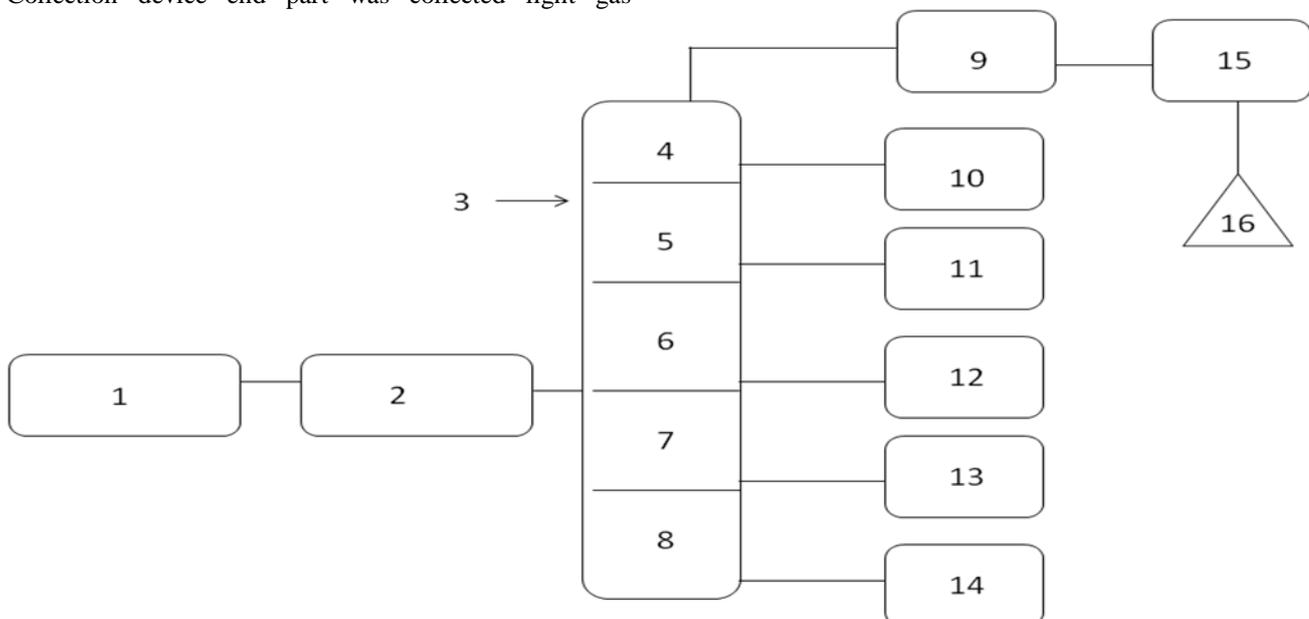

Fig.1: Polypropylene (PP) waste plastic to Kerosene/Jet/ Aviation grade fuel production process

III. RESULTS & DISCUSSION

From GC-MS analysis of PP waste plastic to 3rd fractional fuel or kerosene/jet/aviation (fig. 2 and table 1) in accordance with the various retention times and trace masses different types of hydrocarbon compounds are appeared in the analysis result index. Many compounds are emerged on the analysis carbon range C₈ to C₁₅ among them and few of compounds are discussed. Based on the retention time and trace mass following hydrocarbon compounds as follows such as at the initial phase of the analysis at retention time 4.59 and trace mass 41, compound is 1-Heptene, 4-methyl- (C₈H₁₆), retention time 4.74 and trace mass 71, compound is Heptane, 4-methyl- (C₈H₁₈), retention time 5.05 and trace mass 56, compound is 1-Heptene, 2-methyl- (C₈H₁₆), retention time 5.22 and trace mass 95, compound is 2,4-Hexadiene, 2,5-dimethyl-, (C₈H₁₄), retention time 5.93 and trace mass 111, compound is Cyclohexane, 1,3,5-trimethyl-, (1 α ,3 α ,5 α)-(C₉H₁₈), retention time 6.02 and trace

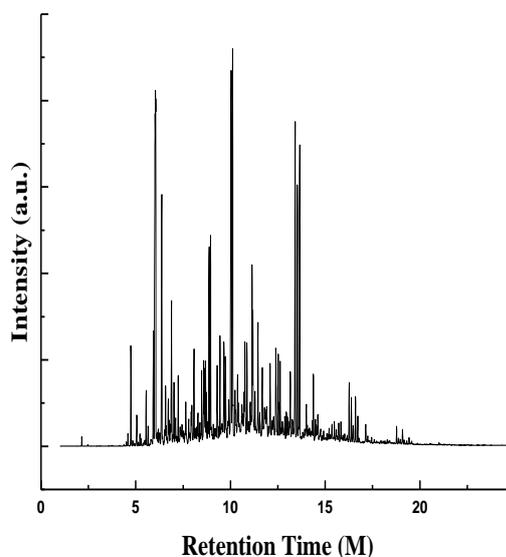

Fig. 2: GC/MS chromatogram of PP waste plastic to kerosene/aviation/ jet category fuel

mass 57, compound is 2,4-Dimethyl-1-heptene (C₉H₁₈), retention time 6.38 and trace mass 42, compound is Cyclohexane, 1,2,4-trimethyl-, (1 α ,2 β ,4 β)-(C₉H₁₈), retention time 6.58 and trace mass 109, compound is Cyclohexane, 1,2,4-trimethyl-, (1 α ,2 β ,4 β)-(C₉H₁₆), retention time 6.89 and trace mass 69, compound is 3-Octene, 2,2-dimethyl- (C₁₀H₂₀), retention time 7.02 and trace mass 43, compound is Hexane,2,4-Dimethyl-(C₈H₁₈), retention time 7.10 and trace mass 83, compound is 1,6-Octadiene, 5,7-dimethyl-, (R)-(C₁₀H₁₈), retention time 7.64 and trace mass 43, compound is 2-Undecanethiol, 2-methyl- (C₁₂H₂₆O), retention time 7.34 and trace mass 95, compound is Cyclohexene, 3-methyl-6-(1-methylethyl)-(C₁₀H₁₈), retention time 7.44 and trace mass 41, compound is compound is 1-Dodecyne (C₁₂H₂₂), retention time 7.96 and trace mass 41, compound is cis-3-Decene (C₁₀H₂₀), retention time 8.29 and trace mass 41, compound is trans-7-Methyl-3-octene (C₁₀H₁₈),

retention time 8.48 and trace mass 56, compound is 2-Methyl-1-Nonene (C₁₀H₂₂), retention time 8.59 and trace mass 41, compound is 3-Undecene,(Z),(C₁₁H₂₂), retention time 8.95 and trace mass 42 compound is Octane, 2,6-dimethyl- (C₁₀H₂₂), retention time 9.45 and trace mass 56, compound name is 3-Undecene, (Z)- (C₁₁H₂₂), retention time 10.87 and trace mass 43, compound is 2-Undecanethiol, 2-methyl- (C₁₂H₂₆S), retention time 11.68 and trace mass 69, compound is Cyclohexane, 1,1,4,4-tetramethyl- (C₁₀H₂₂), retention time 12.39 and trace mass 43, compound is Decane, 2,3,5,8-tetramethyl- (C₁₄H₃₀), retention time 13.65 and trace mass 55, compound is E-14-Hexadecenal (C₁₆H₃₀O), retention time 14.38 and trace mass 55, compound is E-2-Octadecadecen-1-ol (C₁₈H₃₆O), retention time 15.48 and trace mass 43, compound is Decane, 2,3,5,8-tetramethyl- (C₁₄H₃₀), retention time 16.27 and trace mass 43, compound is 2-Hexyl-1-octanol (C₁₄H₃₀O), retention time 17.14 and trace mass 55, compound is E-2-Octadecadecen-1-ol (C₁₈H₃₆O). Ultimately also at retention time 18.77 and trace mass 43, compound is 1-Heptadecene (C₁₇H₃₄) and ultimately retention time 19.57 and trace mass 69, compound is 11-Dodecen-1-ol, 2,4,6-trimethyl-, (R,R,R)- (C₁₅H₃₀O) respectively.

From FT-IR analysis of PP waste plastic to 3rd fractional fuel or jet/kerosene/aviation fuel (fig. 3 and table 2) according to their wave number and spectrum band following types of functional groups are appeared in the analysis. In the spectrum field we noticed that higher wave number are emerged in the initial phase and middle index of the spectrum and in higher wave number small and bulky both functional groups are available and in low wave number double bond and single bond functional groups are available such as methane group, cis and trans alkene etc. Hereafter wave number wave number 2927.06 cm⁻¹ and 2727.53 cm⁻¹ functional group is C-CH₃, wave number 1781.50 cm⁻¹ and 1648.95 cm⁻¹ functional group is Non-Conjugated, wave number 1470.16 cm⁻¹ functional group is CH₃, wave number 993.43 cm⁻¹ functional group is -CH=CH₂, wave number 964.95 cm⁻¹, functional group is -CH=CH-(trans) and ultimately wave number 887.95 cm⁻¹ functional group is C=CH₂ respectively. Energy values are calculated, using formula is E=hv, Where h=Planks Constant, h =6.626x10⁻³⁴ J, v= Frequency in Hertz (sec⁻¹), Where v=c/ λ , c=Speed of light, where, c=3x10¹⁰ m/s, W=1/ λ , where λ is wave length and W is wave number in cm⁻¹. Therefore the equation E=hv, can substitute by the following equation, E=hcW. According to their wave number such as for 2927.06 (cm⁻¹) calculated energy, E=5.81x10⁻²⁰ J, wave number 2727.53 (cm⁻¹) calculated energy, E=5.41x10⁻²⁰ J. Similarly, wave number 1781.50 (cm⁻¹) energy, E =3.53x10⁻²⁰ J, wave number 1648.95(cm⁻¹) calculated energy, E=3.27x10⁻²⁰ J, wave number 1470.16 (cm⁻¹) calculated energy, E = 2.92x10⁻²⁰ J, wave number 993.43 (cm⁻¹), calculated energy, E=1.97x10⁻²⁰ J, wave number 964.95 (cm⁻¹) calculated energy, E=1.91x10⁻²⁰ J and eventually wave number 894.22 (cm⁻¹) calculated energy, E =1.78x10⁻²⁰ J respectively.

Table1: GC/MS chromatogram of PP waste plastic to 3rd fractional or kerosene/jet/aviation fuel compound list

Peak Number	Retention Time (M)	Trace Mass (m/z)	Compound Name	Compound Formula	Molecular Weight	Probability %
1	4.59	41	1-Heptene, 4-methyl-	C ₈ H ₁₆	112	30.7
2	4.74	71	Heptane, 4-methyl-	C ₈ H ₁₈	114	54.6
3	5.05	56	1-Heptene, 2-methyl-	C ₈ H ₁₆	112	48.4
4	5.22	95	2,4-Hexadiene, 2,5-dimethyl-	C ₈ H ₁₄	110	13.9
5	5.55	69	Cyclopentane, 1,1,3,4-tetramethyl-, cis-	C ₉ H ₁₈	126	15.8
6	5.65	43	Hexane, 3-ethyl-	C ₈ H ₁₈	114	19.4

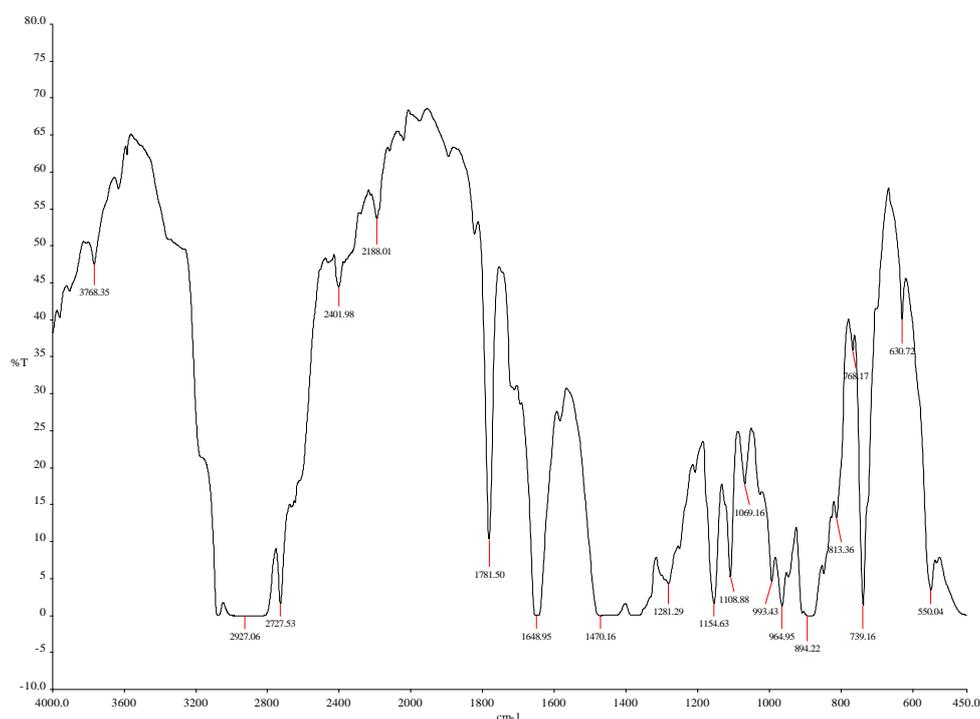

Fig. 3: FT-IR spectrum of PP waste plastic to 3rd fractional fuel or jet/kerosene/aviation fuel

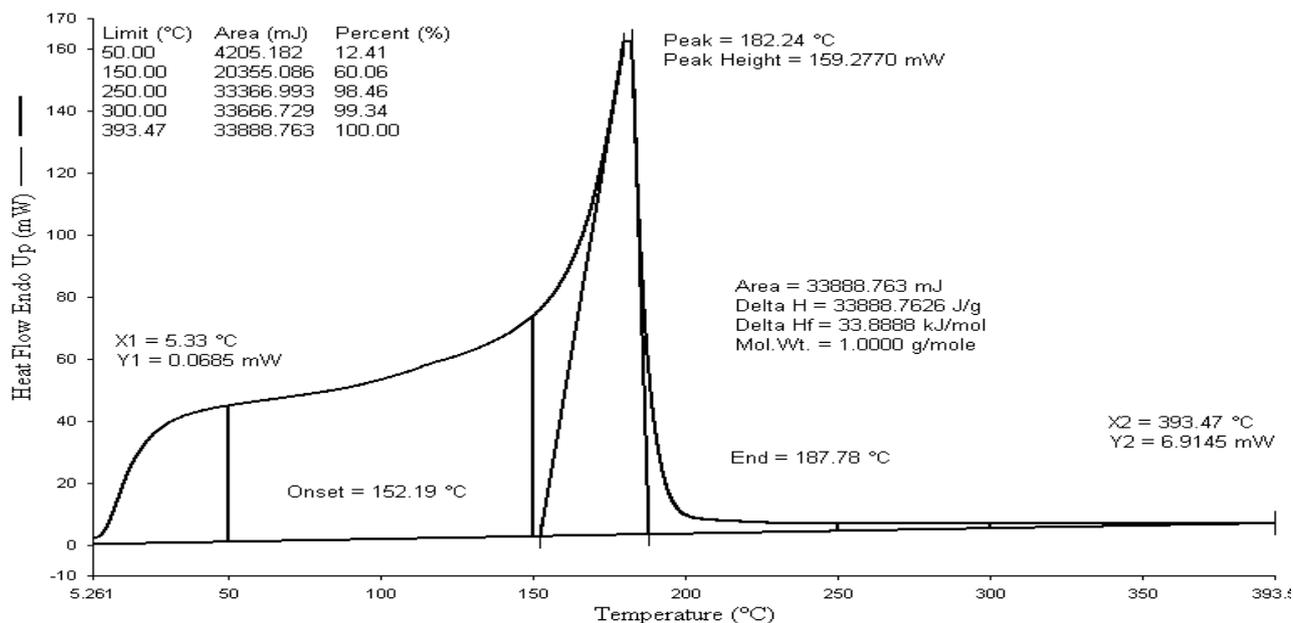

Fig.4: DSC graph of PP waste plastic to 3rd fractional or jet/kerosene/aviation fuel

Third (3rd) fractional fuel or kerosene/aviation/jet category fuel (seen fig. 4) collected from PP waste plastic by using fractional distillation column process at temperature range was 180-210 °C. This fuel category is similar to jet/kerosene/aviation fuel. This fuel looks like heavier fuel and 3rd fractional fuel was analyzed by using DSC for boiling point and enthalpy value measuring. After analyzed fraction fuel by DSC, we noticed that fuel graph showed fuel boil start 5.33 °C and 0.0685 mW, fuel graph onset temperature 152.19 °C and fuel boiling point peak temperature is 182.24 °C, peak height 159.2770 mW. 3rd fraction fuel or kerosene/aviation/ jet fuel heat enthalpy value delta H is 33888.7626 J/g and graph area 33888.763 mJ. Analysis fuel graph showing end temperature is 187.78 °C. Fuel boiling percentage shown at 50°C temperature was 12.41%, 150 °C temperature was 60.06% and finally 100 % fuel boil finished at temperature was 393.47 °C.

IV. CONCLUSION

PP waste plastic to 3rd fractional or kerosene/aviation/ jet category fuel production purposed was use 2 type temperatures profile one for liquefaction temperature and another one was fractional distillation temperature. PP waste plastic produced fuel percentage is 30.40% and in this experiment collected also other grade fuels. Produced fuel density is 0.75 g/ml. Different types of equipment were used for analysis 3rd fractional or aviation/kerosene/jet category fuel such as GC/MS, FTIR and DSC. GC-MS (Gas Chromatography and Mass Spectrometer) analysis result is indicates that in aviation/kerosene/jet category fuel contains extensive number of carbon chain compounds that are derived out by numerous retention time and trace masses of distinct compound. FT-IR analysis derived out available hydrocarbon functional groups are in the aviation/kerosene/jet category fuel and determined that the wide number of hydrocarbon functional group including alkane, alkene and alkyne (Saturated and unsaturated hydrocarbon) compounds are also present in

the fuel. Differential Scanning Calorimeter (DSC) giving the onset temperature of the fuel which represents the boiling point of the aviation/kerosene/jet category fuel. Fuel analysis of GC/MS results indicate that produce fuel hydrocarbon range C₈ to C₁₉. Produced fuel could be use as feed stock refinery for further modification or commercial use. By using this technology could be solve PP waste plastic problem and also reduce the land fill problem that is the cause of infertility of agriculture land.

Abstract: Photovoltaic (PV) energy is the most important energy resource since it is clean, pollution free, and inexhaustible. Due to rapid growth in the semiconductor and power electronics techniques, it is important to operate PV energy conversion systems near the maximum power point to increase the output efficiency of PV arrays. The output power of PV arrays is always changing with weather conditions, which mean solar irradiation and atmospheric temperature. Some MPPT techniques are available in that perturbation and observation (P&O) and improved perturbation and observation (IP&O). A P&O method is the most simple, which moves the operating point toward the maximum power point periodically increasing or decreasing the PV array voltage. It was proved that the P&O method control system sometimes deviates from the maximum operating point. When the MPP is reached, the P&O method will oscillate around it in case of constant or slowly varying atmospheric conditions. This problem can be solved to decrease the perturbation step; however, the tracking response will be slower. In case of rapidly changing atmospheric conditions, the P&O method can occasionally make the system operation point far from the MPP. Perturbation and observation (P&O) is that the operating point oscillates around the maximum power point (MPP). The improved P&O method is introduced, based on hysteresis band and auto-tuning perturbation step. There is trade-off between dynamic response and steady state due to the selection of "dv". The Improved perturbation and observation (IP&O) has the tracking response will be higher. IP&O method has rapidly changing atmospheric conditions then the unpredictable performance with oscillations around maximum power point (MPP). In IP&O has high reliability and it is very complexity. A Mat lab-Simulink based simulation study of PV cell/PV module/PV array is carried out and presented.

I. Introduction:

A photovoltaic system converts sunlight into electricity. The basic device of a photovoltaic system is the photovoltaic cell. Cells may be grouped to form panels or modules. Panels can be grouped to form large photovoltaic arrays. The term array is usually employed to describe a photovoltaic panel (with several cells connected in series and/or parallel) or a group of panels. The term array used henceforth means any photovoltaic device composed of several basic cells. The use of new efficient photovoltaic solar cells (PVSCs) has emerged as an alternative measure of

renewable green power, energy conservation and demand-side management. The performance of a PV array system depends on the operating conditions as well as the solar cell and array design quality. The output voltage, current and power of PV array vary as functions of solar irradiation level, temperature and load current. Therefore the effects of these three quantities must be considered in the design of PV arrays so that any change in temperature and solar irradiation levels should not adversely affect the PV array output to the load/utility, which is either a power company utility grid or any stand alone electrical type load.

Perturbation and Observation (P&O) can track the Maximum Power Point (MPP) all the time, irrespective of the atmospheric conditions, type of PV panel, and even aging, by processing actual values of PV voltage and current. Since the cost of the required circuitry for implementing on-line MPPTs is higher, they are usually employed for larger PV arrays. P&O method is widely used in PV systems because of its simplicity and easy of implementation. However, it presents drawbacks such as slow response speed, oscillation around the MPP in steady state, and even tracking in wrong way under rapidly changing atmospheric conditions. To overcome the above drawbacks of P&O method, provided that the computation is carried out at very fast rates. They are usually based on the comparison of average values of 'i_{p_v}' and 'v_{p_v}' obtained from low-pass filters, which introduce delays, and on the control of the average value of either 'i_{p_v}' or 'v_{p_v}' resulting in slow speeds of response. The proposes a new implementation of a P&O algorithm that mitigates the main drawbacks commonly related to the P&O Method.

An improved perturbation and observation method (IP&O) based on fixed algorithm is proposed, which is automatically adjusts the reference step size and hysteresis bandwidth for power comparison. The IP&O increases the total PV output power by 0.5% at an unsettled weather condition compare to traditional perturbation and observation method (P&O). The Improved perturbation and observation (IP&O) has the tracking response will be higher. When IP&O method has rapidly changing atmospheric conditions then the unpredictable performance with oscillations around maximum power point (MPP). In IP&O has high reliability and it is very complexity The improved P&O method is introduced, based on hysteresis band and auto-tuning perturbation step. There is trade-off between dynamic response and steady state due to the selection of 'dv'.

II. Photovoltaic modeling

Equivalent Electric Circuit of Photovoltaic Cell:

A mathematical description of current voltage terminal characteristics for PV cells. The single exponential equation which models a PV cell is derived from the physics of the PN junction and is generally accepted as reflecting the characteristic behavior of the cell. A double exponential equation may be used for the polycrystalline silicon cells.

$$I = I_{ph} - I_s \left(\frac{\exp(q(V + IR_s))}{N.K.T} - 1 \right) - \frac{(V + IR_s)}{R_{sh}} \quad (1)$$

A solar cell, which is basically a *p-n* semiconductor junction directly, converts light energy into electricity. PV cells are grouped in larger units called PV modules, which are further interconnected in a parallel-series configuration to form PV arrays or generators. The photovoltaic cell considered can be modeled mathematically using the following procedure:

Voltage output of a PV cell:

$$V_{pv} = \left[\frac{N_s AKT}{q} \right] \ln \left[\frac{N_p \times I_{ph} - I_{pv} + N_p \times I_o}{I_o} \right] - I_{pv} R_s \quad (2)$$

Current output of a PV cell:

$$I_{pv} = N_p \times I_{ph} - N_p \times I_o \left[\exp \left\{ \frac{q \times (V_{pv} + I_{pv} R_s)}{N_s AKT} \right\} - 1 \right] \quad (3)$$

$$I_{ph} = [I_{scr} + K_t (T - 298)] \times \frac{\lambda}{100} \quad (4)$$

$$I_o = I_{or} \left[\frac{T}{T_r} \right]^3 \exp \left[\frac{q \times E_{go}}{BK} \left\{ \frac{1}{T_r} - \frac{1}{T} \right\} \right] \quad (5)$$

The PV array power P can be calculated using the following equation:

$$P_{pv} = I_{PV} \times V_{PV}$$

$$P_{pv} = V_{pv} \times N_p \times I_{ph} - V_{pv} \times N_p \times I_o \left[\exp \left\{ \frac{q \times (V_{pv} + I_{pv} R_s)}{N_s AKT} \right\} - 1 \right] \quad (6)$$

Where,

V_{pv} Is output voltage of a PV cell (V)

I_{pv} Is output current of a PV cell (A)

N_s Is the number of modules connected in series

N_p Is the number of modules connected in parallel

I_{ph} is the light generated current in a PV cell (A)

I_o is the PV cell saturation current (A)

R_s is the series resistance of a PV cell

$A=B$ is an ideality factor=1.6

K is Boltzmann constant=1.3805e-23Nm/K

T is the cell temperature in Kelvin=298K

Q is electron charge=1.6e-19Coulombs

T_r =The reference temperature=301.18k

I_{scr} =PV cell short-circuit current at 25°C and 100Mw/cm²=3.27A

N = number of cells

K_t =The short-circuit current temperature co-efficient at

I_{scr} =0.0017A/°C

R_{sh} = shunt resistance of a PV cell

I_s = saturation current

λ =is the PV cell illumination (MW/cm²)=100Mw/cm²

I_{or} =Saturation current at T_r =2.0793e^{-6A}

E_{go} = is the band gap for silicon=1.1eV

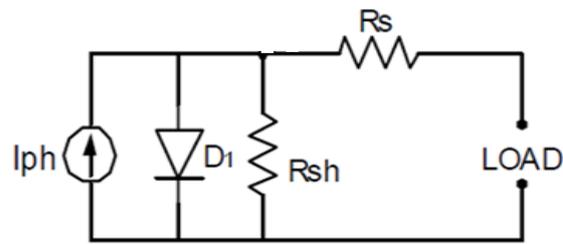

Figure1: PV Cell Circuit Model

The complete behavior of PV cells are described by five model parameters (I_{ph} , N , I_s , R_s , R_{sh}) which is representative of the physical behavior of PV cell/module. These five parameters of PV cell/module are in fact related to two environmental conditions of solar isolation & temperature. The determination of these model parameters is not straightforward owing to non-linear nature of equation.

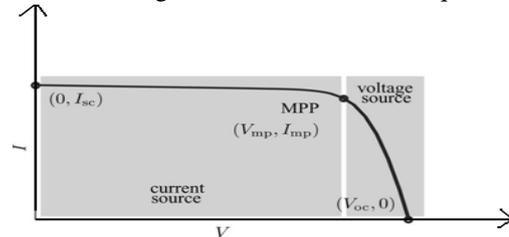

Figure 2: Maximum Power Point (V_{mp} , I_{mp})

Characteristic $I-V$ curve of a practical PV device and the three remarkable points: short circuit ($0, I_{sc}$), MPP (V_{mp}, I_{mp}), and open circuit ($V_{oc}, 0$).

III. MPPT Techniques

A. Perturbation and Observation:

P&O algorithms are widely used in MPPT because of their simple structure and the few measured parameters which are required. They operate by periodically perturbing (i.e. incrementing or decrementing) the array termed voltage and comparing the PV output power with that of the previous perturbation cycle. If the power is increasing, the perturbation will continue in the same direction in the next cycle, otherwise the perturbation direction will be reversed. This means the array terminal voltage is perturbed every

MPPT cycle, therefore when the P&O is reached, the P&O algorithm will oscillate around it resulting in a loss of PV power, especially in cases of constant or slowly varying atmospheric conditions. This problem can be solved by improving the logic of the P&O algorithm to compare the parameters of two preceding cycles in order to check when the P&O is reached, and bypass the perturbation stage. Another way to reduce the power loss around the P&O is to decrease the perturbation step, however, the algorithm will be slow in following the P&O when the atmospheric conditions start to vary and more power will be lost.

The implementation of P&O type MPPTs with increased refresh rates of current (I)-requires two things. First, the P&O algorithm should operate with high sampling rates and the sample values of voltage and current should reflect the tendency of the output power when increasing or decreasing the reference signal for the MPPT power converter. Second, the response time of the MPPT power converter should be very fast while keeping the switching losses (frequency) low. This can be done by comparing instantaneous, instead of average, values of V_{pv} and peak current control that presents one-cycle speed of response for small variations in the reference current, to further improve the performance of the system. The proposed MPPT system employs peak current control. The switch is turned on by a clock signal and turned off when the actual current reaches the reference current. Therefore, the reference current can be perturbed (increased or decreased) in every switching cycle, meaning that the perturbation cycle or refresh rate is equal to the switching cycle.

A.1 P&O With Fixed Perturb:

In this method, a fixed perturb value is utilized to generate a reference signal for the outer control loop. The Perturb signal is either the array reference voltage or current. The fixed perturb step is determined according to the system designer as a result of previous experience. Therefore, the solution provided by this method is not generic and system dependent. For small perturb steps, the tracking is slow but the power/voltage oscillations are minimal. In the case of large perturb step, faster tracking is achieved with increased oscillations. Hence, P&O techniques with fixed perturb suffer an inherent tracking-oscillations trade off problem. A PI/hysteresis Controller following the MPPT is utilized to control the power converter.

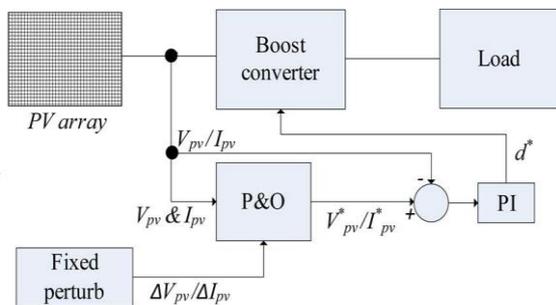

Fig.4 Fixed perturb with Perturbation and Observation

The size of the perturbation has to be chosen according to the inductor size and the switching (clock) frequency so that the switch always turns off before the next turn on signal. The perturbation and observation method (P&O), which moves the operation point of array toward the maximum power point (MPP) by periodically of any output voltage, is often used in many PV systems. It works well when the Irradiance changed very slowly, but the P&O method fails to track the MPP when irradiance changed suddenly by having slow dynamic response.

B. Improved Perturbation and Observation:

The improved perturbation and observation method (IP&O) is proposed. The IP&O method is implemented in a software program with fixed algorithm, which automatically adjusts the reference voltage step size and hysteresis band to achieve dynamic response and search exactly MPP under rapidly changing condition. The improved P&O method is introduced, based on hysteresis band and auto-tuning perturbation step. There is trade-off between dynamic response and steady state due to the selection of 'dv' the perturbation step. The system response of the IP&O method has faster dynamic response and higher induced-power than the Perturbation and Observation (P&O) method has. The overall Maximum Power Point (MPP) tracking efficiencies of Improved Perturbation and Observation (IP&O) method are also higher as around 0.5% in the unsettled weather condition than those of P&O method.

The number of samples per switching cycle, type (synchronized/ unsynchronized) and ideal instant for sampling (maximum and minimum current) are investigated in order to obtain fast calculation of the direction of the next perturbation. The Improved perturbation and observation was used to implement the proposed MPPT control system, which controls the dc/dc boost converter in the 3kW grid-connected PV power systems. The IP&O results shows that the increases total PV output power by 0.5% at an unsettled weather condition compare to traditional perturbation and observation.

The limitation of P&O methods is that they tend to mistrack the MPP under rapidly changing atmospheric conditions. During a transient it moves the operating point away from the MPP instead of towards it. This phenomenon shows how a faster IP&O implementation can reduce this problem. IP&O MPPT algorithms are based on the assumption of constant atmospheric conditions and that the variations in the output power are due to the injected perturbations. It compares values of p_{pv} and i_{pv} at are supposed to lie on the same curve. Problems arise when the two points are not on the same curve due to a sudden variation on the solar irradiation. Let's assume that the solar irradiation level is initially and then increases. Depending on the sampling frequency, the present values for P and I will be obtained from curves (high sampling rate). The IP&O algorithm would be decrease I, driving the operating point towards the new MPP. However, for low sampling rates, would then be increased by the IP&O algorithm driving the operating point away from the new MPP. Therefore, operation with high sampling rates (small perturbation

cycles) reduces the odds of wrong tracking the MPP during sudden solar irradiation variations.

B.1 Improved P&O With Fixed Perturb:

In this technique, instead of utilizing the array voltage or current as the perturbed signal, the converter duty ratio is used. This eases the control process as it eliminates the PI/hysteresis controller after the MPPT block, enabling direct control of the converter’s duty cycle. The perturb step is fixed and designer dependent. Hence, the previously mentioned trade off problem still persists. In order to improve the performance of P&O techniques, the modified calculation of the perturb value is utilized instead of the fixed values. The Improved P&O techniques review are discussed in the following sections.

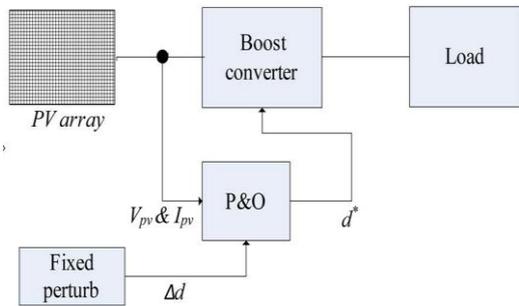

Fig5. Improved with fixed Perturbation and Observation

IV. Simulation Results

PV array Curves

The PV cell temperature is maintained constant at 25°C and the solar intensity is varied in steps up to the rated value of 100mWcm⁻². It is seen from the figure .6 that for a constant solar intensity the current remains constant with increasing voltage up to 100Volts after which it decreases. It is further observed that the current increase with increasing intensity thereby increasing the power output of the solar cell.

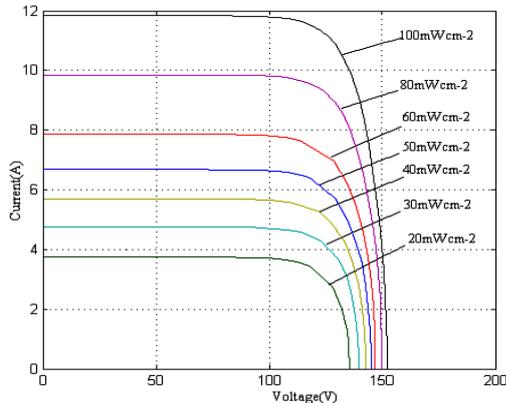

Figure6: V-I Curve with different irradiation

The PV cell temperature is maintained constant at 25°C and the solar intensity is varied in steps up to the rated value of 100mWcm⁻². It is seen from the figure .7 that for a

constant solar intensity the power remains constant with increasing voltage up to 100Volts after which it decreases.

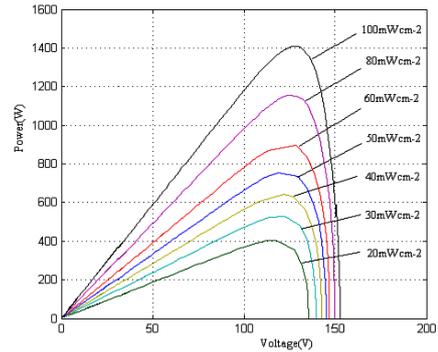

Figure7: P-V Curve with different irradianations

The effect of temperature variations on the V-I characteristics of the PV cell is shown in figure.8. A marginal variation in current is observed for a temperature variation from 25°C to 65°C for a voltage up to 65Volts. Above this value the current decreases in a sharp manner for small variation in voltage. It is further seen that the voltage of which the cell current becomes zero increases with decreasing temperature.

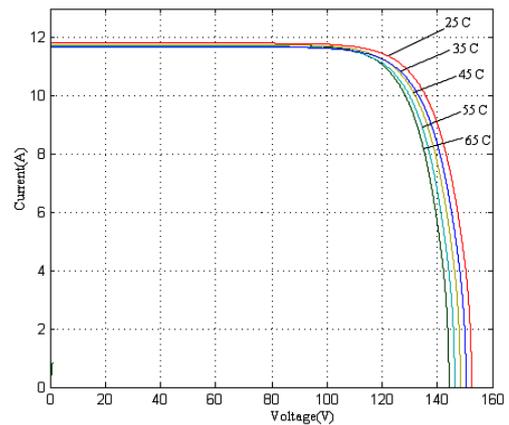

Figure8: V-I Curve with different temperature

The effect of temperature variations on the P-V characteristics of the PV cell is shown in figure 9. power variation is observed for a temperature variation from 25°C to 65°C for a voltage up to 65volts.the power decreases in a sharp manner for small variation in voltage.

Table 1. Comparison of P&O and Improved P&O MPPT Techniques:

S.NO	MPPT TECHNIQUES	VOLTAGE (V)	CURRENT (A)	POWER (W)	EFFICIENCY (%)
1	PERTURBATION AND OBSERVATION	137.8	7.577	1044	90%
2	IMPROVED PERTURBATION AND OBSERVATION	135.2	8.104	1096	94.38%

Table2. Comparison of two MPPT methods:

Specifications	Perturbation and Observation	Improved Perturbation and Observation
Cost	Relatively lower	Moderately lower
Reliability	Accurate but oscillates around the MPP	Precise but oscillates around the MPP
Complexity	Easy but complex when site conditions vary	High
Realization	Easy to implement as few measured parameters	Difficult to implement as few measured parameters
Efficiency	High about 90%	High about 98%
Rapidly Changing Atmospheric conditions	Unpredictable performance with oscillations around MPP. slower response	Efficient performance with oscillations around MPP. Higher response

V. Conclusion

This paper proposes design of photo voltaic system, simple boost converter, perturbation and observation (P&O), improved perturbation and observation (IP&O). The PV cell output voltage varies with atmospheric parameters such as temperature and irradiation. By increasing series and parallel cells, voltage will be drop. The PV Array output voltage gradually decrease and then steady state conditions. PV array Cascaded with Boost converter is used to step up output voltage. Perturbation and observation (P&O) method is widely used in photovoltaic (PV) systems because of its simplicity and easily of implementation. A P&O method is the most simple, which moves the operating point towards the maximum power point. P&O method control system sometimes deviates from the maximum operating point. This paper proposes design of photo voltaic system, simple boost converter IP&O based on modified fixed algorithm is automatically adjusts the reference step size and hysteresis bandwidth for power conversion. The improved P&O method is based on auto-tuning perturbation. The Improved perturbation and observation (IP&O) has the tracking response will be higher. When IP&O method has rapidly changing atmospheric conditions then the unpredictable performance with oscillations around maximum power point (MPP). In IP&O has high reliability and it is very complexity. The advantage of improved perturbation and observation (IP&O). It finds the real MPP under any working conditions. No oscillation during tracking and steady state operations. Low computational burden required. Hence, fast tracking using low cost controller is achievable. Applications of Improved perturbation and observation (IP&O) are Impedance matching and Micro grid technology. In future, Advanced MPPT techniques are used like adaptive

perturbation (AP&O), fuzzy logic controller and neural networks.

ABSTRACT: The objective of fabric inspection is to ascertain whether the fabric received is of expected Quality standard or not. The main objective is detection of fabric defects as early as possible so that time and money are not wasted in the manufacturing, process. The ultimate goal of any quality control activity in clothing' industry is to satisfy the customers. Most defects in cloth occur while it is woven on the loom. Some of these fabric defects are visible, while others are not. Again some fabric defects may be rectified during weaving and after weaving while others are not. Often inspectors are given the responsibility of inspecting finished garments manually without adequate training in fabric defects and their causes. Detection of defects was generally carried out by time-consuming and tedious human inspection. Such manual inspection procedures are commonly agreed upon to be inefficient with detection efficiency suffering from deterioration due to boredom and lack of vigilance. The problem is accentuated by the presence of several types of defects those may occur in woven fabric at random. As we know that fabric are the main and costly raw materials of a garment. So it is very important to use fabric efficiently and control wastage of fabric. On the other hand fabric defects are the maximum defects of garments, for which many-unexpected problem may occur in a clothing industry. Such as- short shipment, discount, low price etc.

Keywords: Fabric inspection, Hybrid model, YCBCR technique, Wavelet transform (WT), Image distance difference algorithm.

I. INTRODUCTION

The production of quality fabric is the foremost goal of the modern textile industry. Typical textile mills employ humans to inspect and grade the fabric in the production facility. The job is monotonous, as it requires the employee to sit at an inspection frame and watch as fabric that is 5-9ft wide passes over the board at speeds ranging from 8-20 yards a minute, all the while visually scanning that wide area of fabric for possible defects as shown in Fig.1 Traditional fabric inspection. The average human inspection department is only able to find 60%-75% of existing defects, which translates into a substantial amount of second quality shipped or returned. This alone leads to a considerable reduction in production efficiency, as most customers will only accept a certain percentage of second quality fabric in their order, meaning that the production facility must spend time producing re-work to be able to meet the customer demands. In an effort to improve the efficiency of inspection departments and subsequently reduce the costs of production, textile manufacturers have begun turning to automate inspection

systems. An automated inspection system usually consists of a computer based vision system. Because they are computer based, these systems do not suffer the drawbacks of human visual inspection, such as fatigue, boredom, or inattentiveness. Automated systems are able to inspect fabric in a continuous manner without pause.

Fig.1 Traditional fabric inspections.

In this paper, a new fabric defect detection algorithm based on YCBCR technique is proposed. This technique is used to have more accurate results.

II. FABRIC DEFECTS

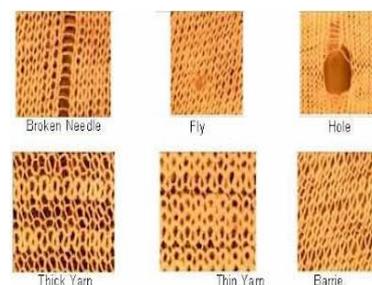

In fabric field there are different types of faults such as scratch, hole, dirty spots, color bleeding etc. If these faults are not detected properly it will affect the production system massively.

Major and Minor Defects

The following definitions are central to fabric inspection:

Major Defect: A defect that, if conspicuous on the finished product, would cause the item to be a second. (A "second" is a garment with a conspicuous defect that affects the salability or serviceability of the item.

Minor Defects: A defect that would not cause the product to be termed a second either because of severity or location. When inspecting piece goods prior to cutting, it is necessary to rate questionable defects as major, since the inspector will not know where the defect may occur on the item.

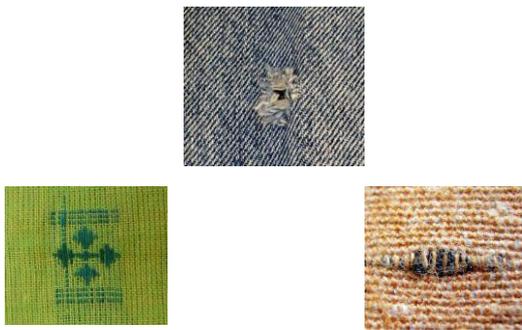

Fig.2 Defects in fabric

III. YCbCr TECHNIQUE

One of two primary color spaces used to represent digital component video (the other is RGB). **YCbCr**, **Y'CbCr**, or **Y Pb/Cb Pr/Cr**, also written as $Y C_B C_R$ or $Y' C_B C_R$, is a family of color spaces used as a part of the color image pipeline in video and digital photography systems. The difference between YCbCr and RGB is that YCbCr represents color as brightness and two color difference signals, while RGB represents color as red, green and blue. In YCbCr, the Y is the brightness (luma), Cb is blue minus luma (B-Y) and Cr is red minus luma (R-Y). **YCBCR = rgb2ycbcr(RGB)** converts the truecolor image RGB to the equivalent image in the YCbCr color space.

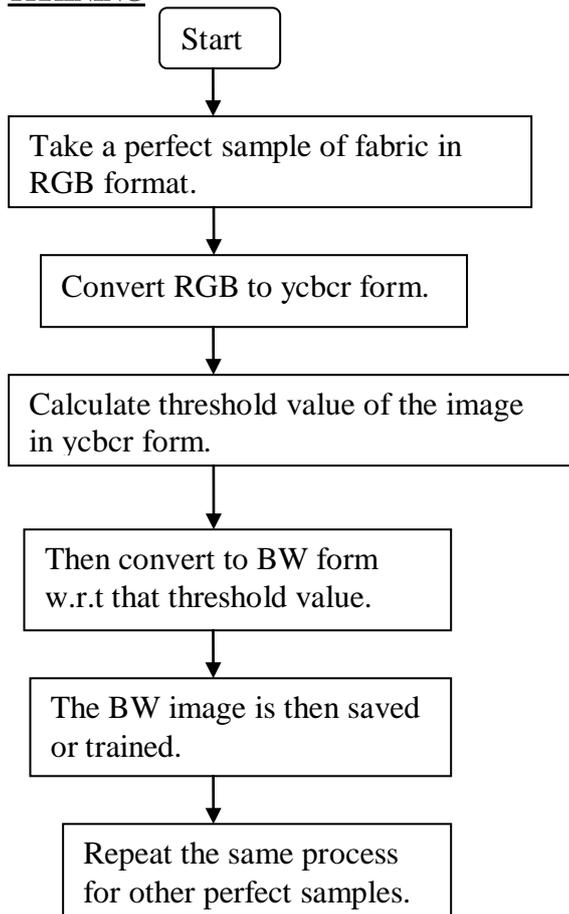

If the input is uint8, YCBCR is uint8, where Y is in the range [16 235], and Cb and Cr are in the range [16 240]. If the input is a double, Y is in the range [16/255 235/255] and Cb and Cr are in the range [16/255 240/255]. If the input is uint16, Y is in the range [4112 60395] and Cb and Cr are in the range [4112 61680]. YCbCr and Y'CbCr are a practical approximation to color processing and perceptual uniformity, where the primary colors corresponding roughly to red, green and blue are processed into perceptually meaningful information. By doing this, subsequent image/video processing, transmission and storage can do operations and introduce errors in perceptually meaningful ways. Y'CbCr is used to separate out a luma signal (Y') that can be stored with high resolution or transmitted at high bandwidth, and two chroma components (C_B and C_R) that can be bandwidth-reduced, subsampled, compressed, or otherwise treated separately for improved system efficiency.

IV. METHODOLOGY OF PAPER

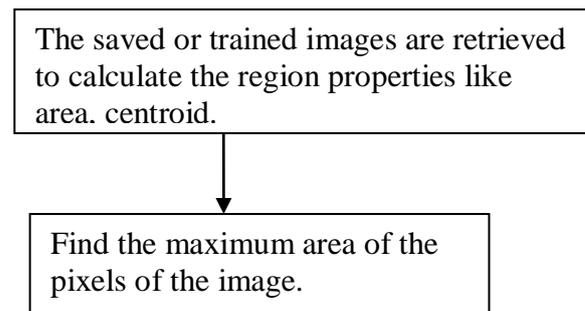

Our defect detection system consists mainly of three parts: **Training, feature extraction and testing (detection)**.

- The training and feature extraction part uses wavelet transform (WT) technique in decomposition of image into wavelets.
- The testing (detection) part utilizes image distance difference algorithm to find the absolute difference between the trained and tested image.

V. CONCLUSION

The conclusions from this paper suggest that the combination of Wavelet Transform and image distance difference algorithm approaches can give better results than any single approach, and is suggested for further research. Experiments show that using YCbCr color space technique has improved the detection performance of the defective fabric.

As it is simple and efficient, it is also appropriate to real-time defect detection.

Theory of Alfa Ray Production, Quantum Tunneling, Redundancy, Entropy, Event, Cause, Space, Time, Storage Ability and Entanglement-A Tarantula-Guillemot Model

¹Dr. K. N. Prasanna Kumar, ²Prof. B. S. Kiranagi, ³Prof. C. S. Bagewadi

ABSTRACT: We propose a Theory of Alpha ray production(Radioactive decay), Quantum Tunneling, Redundancy, Entropy, Event, Cause, Space, Time, Storage ability, Quantum entanglement, Noise, Errors, by a Model that concatenates and consummates these important variables and provide predictive capacity, Stability analysis, and Solutional behaviour of the system,

I. INTRODUCTION

What is an event? Or for that matter an ideal event? An event is a singularity or rather a set of singularities or set of singular points characterizing a mathematical curve, a physical state of affairs, a psychological person or a moral person. Singularities are turning points and points of inflection: they are bottle necks, foyers and centers; they are points of fusion; condensation and boiling; points of tears and joy; sickness and health; hope and anxiety; they are so to say "sensitive" points; such singularities should not be confused or confounded, aggravated or exacerbated with personality of a system expressing itself; or the individuality and idiosyncrasies of a system which is designated with a proposition. They should also not be fused with the generalizational concept or universalistic axiomatic predications and postulation alcovishness, or the dipsomaniac flageolet dirge of a concept. Possible a concept could be signified by a figurative representation or a schematic configuration. "Singularity is essentially, pre individual, and has no personalized bias in it, or for that matter a prejudice or pre circumspection of a conceptual scheme. It is in this sense we can define a "singularity" as being neither affirmative nor non affirmative. it can be positive or negative; it can create or destroy. On the other hand it must be noted that singularity is different both in its thematic discursive from the run of the mill day to day musings and mundane drooling. There are in that sense "extra-ordinary".

Each singularity is a source and resource, the origin, reason and raison d'être of a mathematical series, it could be any series any type, and that is interpolated or extrapolated to the structural location of the destination of another singularity. This according to this standpoint, there are different, multifarious, myriad, series in a structure. In the eventuality of the fact that we conduct an unbiased and prudent examination of the series belonging to different "singularities" we can come to indubitable conclusion that the "singularity" of one system is different from the "other system" in the subterranean realm and ceratoid dualism of comparison and contrast

EPR experiment derived that there exists a communications between two particles. We go a further step to say that there exists a channel of communication however slovenly, inept, clumpy, between the two singularities. It is also possible the communication exchange could be one of belligerence, cantankerousness, tempestuousness, astutely truculent, with ensorcelled frenzy. That does not matter. All we are telling is that singularities communicate with each other.

Now, how do find the reaction of systems to these singularities. You do the same thing a boss does for you. "Problematize" the events and see how you behave. I will resort to "pressure tactics". "intimidation of deriding report", or "cut in the increment" to make you undergo trials, travails and tribulations. i am happy to see if you improve your work; but may or may not be sad if you succumb to it and hang yourself! We do the same thing with systems. systems show conducive response, felicitous reciprocation or behave erratically with inner roil, eponymous radicalism without and with blitz conviction say like a solipsist nature of bellicose and blustering particles, or for that matter coruscation, trepidational motion in fluid flows, or seemingly perfidious incendiaries in gormandizing fellow elementary particles, abnormal ebullitions, surcharges calumniation and unwarranted (you think so but the system does not!) unrighteous fulminations.

So the point that is made here is " like we problematize the "events" to understand the human behaviour we have to "problematize" the events of systems to understand their behaviour.

This statement is made in connection to the fact that there shall be creation or destruction of particles or complete obliteration of the systems (blackhole evaporation) or obfuscation of results. Some systems are like "inside traders" they will not put signature at all! How do you find they did it! Anyway, there are possibilities of a CIA/CBI finding out as they recently did! So we can do the same thing with systems to. This is accentuation, corroboration, fortification, .commendatory note to explain the various coefficients we have used in the model as also the dissipations called for In the bank example we have clarified that various systems are individually conservative, and their conservativeness extends holistically too.that one law is universal does not mean there is complete adjudication of nonexistence of totality or global or holistic figure. Total always exists and "individual" systems always exist, if we do not bring Kant in to picture! For the time being let us not! Equations would become more eneuretic and frenzied..

We TAKE In to consideration the following parameter:

- (1) Alpha ray production(Radioactive decay)
- (2) Quantum Tunneling
- (3) Redundancy
- (4) Entropy
- (5) Event
- (6) Cause
- (7) Space
- (8) Time
- (9) Storage ability
- (10) Quantum entanglement
- (11) Noise Errors.

Where we suppose.

- (A) $(a_i)^{(1)}, (a_i)^{(1)}, (a_i)^{(1)}, (b_i)^{(1)}, (b_i)^{(1)}, (b_i)^{(1)} > 0$,
 $i, j = 13, 14, 15$
 (B) The functions $(a_i)^{(1)}, (b_i)^{(1)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(1)}, (\tau_i)^{(1)}$:

$$(a_i)^{(1)}(T_{14}, t) \leq (p_i)^{(1)} \leq (\hat{A}_{13})^{(1)}$$

$$(b_i'')^{(1)}(G, t) \leq (r_i)^{(1)} \leq (b_i')^{(1)} \leq (\hat{B}_{13})^{(1)}.$$

$$(C) \quad \lim_{T_2 \rightarrow \infty} (a_i'')^{(1)}(T_{14}, t) = (p_i)^{(1)}$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(1)}(G, t) = (r_i)^{(1)}$$

Definition of $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}$:

Where $(\hat{A}_{13})^{(1)}, (\hat{B}_{13})^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}$ are positive constants and $i = 13, 14, 15$.

They satisfy Lipschitz condition:

$$|(a_i'')^{(1)}(T'_{14}, t) - (a_i'')^{(1)}(T_{14}, t)| \leq (\hat{k}_{13})^{(1)} |T'_{14} - T_{14}| e^{-(M_{13})^{(1)}t}$$

$$|(b_i'')^{(1)}(G', t) - (b_i'')^{(1)}(G, t)| < (\hat{k}_{13})^{(1)} \|G - G'\| e^{-(M_{13})^{(1)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions

$(a_i'')^{(1)}(T'_{14}, t)$ and $(a_i'')^{(1)}(T_{14}, t)$. (T'_{14}, t) and (T_{14}, t) are points belonging to the interval $[(\hat{k}_{13})^{(1)}, (\hat{M}_{13})^{(1)}]$. It is to be noted that $(a_i'')^{(1)}(T_{14}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{13})^{(1)} = 1$ then the function $(a_i'')^{(1)}(T_{14}, t)$, the first augmentation coefficient WOULD be absolutely continuous. .

Definition of $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$:

(D) $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}$, are positive constants

$$\frac{(a_i)^{(1)}}{(\hat{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\hat{M}_{13})^{(1)}} < 1.$$

Definition of $(\hat{P}_{13})^{(1)}, (\hat{Q}_{13})^{(1)}$:

(E) There exists two constants $(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ which together with $(\hat{M}_{13})^{(1)}, (\hat{k}_{13})^{(1)}, (\hat{A}_{13})^{(1)}$ and $(\hat{B}_{13})^{(1)}$ and the constants $(a_i)^{(1)}, (a_i')^{(1)}, (b_i)^{(1)}, (b_i')^{(1)}, (p_i)^{(1)}, (r_i)^{(1)}, i = 13, 14, 15$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(a_i)^{(1)} + (a_i')^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1$$

$$\frac{1}{(\hat{M}_{13})^{(1)}} [(b_i)^{(1)} + (b_i')^{(1)} + (\hat{B}_{13})^{(1)} + (\hat{Q}_{13})^{(1)} (\hat{k}_{13})^{(1)}] < 1.$$

Where we suppose.

$$(a_i)^{(2)}, (a_i')^{(2)}, (a_i'')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (b_i'')^{(2)} > 0, \quad i, j = 16, 17, 18.$$

The functions $(a_i'')^{(2)}, (b_i'')^{(2)}$ are positive continuous increasing and bounded..

Definition of $(p_i)^{(2)}, (r_i)^{(2)}$:

$$(a_i'')^{(2)}(T'_{17}, t) \leq (p_i)^{(2)} \leq (\hat{A}_{16})^{(2)}.$$

$$(b_i'')^{(2)}(G_{19}, t) \leq (r_i)^{(2)} \leq (b_i')^{(2)} \leq (\hat{B}_{16})^{(2)}.$$

$$\lim_{T_2 \rightarrow \infty} (a_i'')^{(2)}(T_{17}, t) = (p_i)^{(2)}.$$

$$\lim_{G \rightarrow \infty} (b_i'')^{(2)}(G_{19}, t) = (r_i)^{(2)}.$$

Definition of $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}$:

Where $(\hat{A}_{16})^{(2)}, (\hat{B}_{16})^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}$ are positive constants and $i = 16, 17, 18$.

They satisfy Lipschitz condition:.

$$|(a_i'')^{(2)}(T'_{17}, t) - (a_i'')^{(2)}(T_{17}, t)| \leq (\hat{k}_{16})^{(2)} |T'_{17} - T_{17}| e^{-(M_{16})^{(2)}t}$$

$$|(b_i'')^{(2)}(G'_{19}, t) - (b_i'')^{(2)}(G_{19}, t)| < (\hat{k}_{16})^{(2)} \|G_{19} - G'_{19}\| e^{-(M_{16})^{(2)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a_i'')^{(2)}(T'_{17}, t)$ and $(a_i'')^{(2)}(T_{17}, t)$. (T'_{17}, t) and (T_{17}, t) are points belonging to the interval $[(\hat{k}_{16})^{(2)}, (\hat{M}_{16})^{(2)}]$. It is to be noted that $(a_i'')^{(2)}(T_{17}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{16})^{(2)} = 1$ then the function $(a_i'')^{(2)}(T_{17}, t)$, the SECOND augmentation coefficient would be absolutely continuous. .

Definition of $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$:

(F) $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}$, are positive constants

$$\frac{(a_i)^{(2)}}{(\hat{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\hat{M}_{16})^{(2)}} < 1.$$

Definition of $(\hat{P}_{16})^{(2)}, (\hat{Q}_{16})^{(2)}$:

There exists two constants $(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ which together with $(\hat{M}_{16})^{(2)}, (\hat{k}_{16})^{(2)}, (\hat{A}_{16})^{(2)}$ and $(\hat{B}_{16})^{(2)}$ and the constants $(a_i)^{(2)}, (a_i')^{(2)}, (b_i)^{(2)}, (b_i')^{(2)}, (p_i)^{(2)}, (r_i)^{(2)}, i = 16, 17, 18$, satisfy the inequalities .

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(a_i)^{(2)} + (a_i')^{(2)} + (\hat{A}_{16})^{(2)} + (\hat{P}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1.$$

$$\frac{1}{(\hat{M}_{16})^{(2)}} [(b_i)^{(2)} + (b_i')^{(2)} + (\hat{B}_{16})^{(2)} + (\hat{Q}_{16})^{(2)} (\hat{k}_{16})^{(2)}] < 1.$$

Where we suppose.

(G) $(a_i)^{(3)}, (a'_i)^{(3)}, (a''_i)^{(3)}, (b_i)^{(3)}, (b'_i)^{(3)}, (b''_i)^{(3)} > 0, \quad i, j = 20, 21, 22$

The functions $(a''_i)^{(3)}, (b''_i)^{(3)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(3)}, (r_i)^{(3)}$:

$$(a''_i)^{(3)}(T_{21}, t) \leq (p_i)^{(3)} \leq (\hat{A}_{20})^{(3)}$$

$$(b''_i)^{(3)}(G_{23}, t) \leq (r_i)^{(3)} \leq (b'_i)^{(3)} \leq (\hat{B}_{20})^{(3)}.$$

$$\lim_{T_2 \rightarrow \infty} (a''_i)^{(3)}(T_{21}, t) = (p_i)^{(3)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(3)}(G_{23}, t) = (r_i)^{(3)}$$

Definition of $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}$:

Where $(\hat{A}_{20})^{(3)}, (\hat{B}_{20})^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}$ are positive constants and $i = 20, 21, 22$.

They satisfy Lipschitz condition:

$$|(a''_i)^{(3)}(T'_{21}, t) - (a''_i)^{(3)}(T_{21}, t)| \leq (\hat{k}_{20})^{(3)} |T_{21} - T'_{21}| e^{-(M_{20})^{(3)}t}$$

$$|(b''_i)^{(3)}(G'_{23}, t) - (b''_i)^{(3)}(G_{23}, t)| < (\hat{k}_{20})^{(3)} ||G_{23} - G'_{23}'|| e^{-(M_{20})^{(3)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(3)}(T'_{21}, t)$ and $(a''_i)^{(3)}(T_{21}, t)$. (T'_{21}, t) and (T_{21}, t) are points belonging to the interval $[(\hat{k}_{20})^{(3)}, (\hat{M}_{20})^{(3)}]$. It is to be noted that $(a''_i)^{(3)}(T_{21}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{20})^{(3)} = 1$ then the function $(a''_i)^{(3)}(T_{21}, t)$, the THIRD augmentation coefficient, would be absolutely continuous.

Definition of $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$:

(H) $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}$, are positive constants

$$\frac{(a_i)^{(3)}}{(\hat{M}_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(\hat{M}_{20})^{(3)}} < 1.$$

There exists two constants There exists two constants $(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ which together with $(\hat{M}_{20})^{(3)}, (\hat{k}_{20})^{(3)}, (\hat{A}_{20})^{(3)}$ and $(\hat{B}_{20})^{(3)}$ and the constants $(a_i)^{(3)}, (a'_i)^{(3)}, (b_i)^{(3)}, (b'_i)^{(3)}, (p_i)^{(3)}, (r_i)^{(3)}, i = 20, 21, 22$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(a_i)^{(3)} + (a'_i)^{(3)} + (\hat{A}_{20})^{(3)} + (\hat{P}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1$$

$$\frac{1}{(\hat{M}_{20})^{(3)}} [(b_i)^{(3)} + (b'_i)^{(3)} + (\hat{B}_{20})^{(3)} + (\hat{Q}_{20})^{(3)} (\hat{k}_{20})^{(3)}] < 1.$$

Where we suppose.

(I) $(a_i)^{(4)}, (a'_i)^{(4)}, (a''_i)^{(4)}, (b_i)^{(4)}, (b'_i)^{(4)}, (b''_i)^{(4)} > 0, \quad i, j = 24, 25, 26$

(J) The functions $(a''_i)^{(4)}, (b''_i)^{(4)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(4)}, (r_i)^{(4)}$:

$$(a''_i)^{(4)}(T_{25}, t) \leq (p_i)^{(4)} \leq (\hat{A}_{24})^{(4)}$$

$$(b''_i)^{(4)}((G_{27}), t) \leq (r_i)^{(4)} \leq (b'_i)^{(4)} \leq (\hat{B}_{24})^{(4)}.$$

$$(K) \quad \lim_{T_2 \rightarrow \infty} (a''_i)^{(4)}(T_{25}, t) = (p_i)^{(4)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(4)}((G_{27}), t) = (r_i)^{(4)}$$

Definition of $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}$:

Where $(\hat{A}_{24})^{(4)}, (\hat{B}_{24})^{(4)}, (p_i)^{(4)}, (r_i)^{(4)}$ are positive constants and $i = 24, 25, 26$.

They satisfy Lipschitz condition:

$$|(a''_i)^{(4)}(T'_{25}, t) - (a''_i)^{(4)}(T_{25}, t)| \leq (\hat{k}_{24})^{(4)} |T_{25} - T'_{25}| e^{-(M_{24})^{(4)}t}$$

$$|(b''_i)^{(4)}((G'_{27}), t) - (b''_i)^{(4)}((G_{27}), t)| < (\hat{k}_{24})^{(4)} ||G_{27} - (G'_{27})'|| e^{-(M_{24})^{(4)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(4)}(T'_{25}, t)$ and $(a''_i)^{(4)}(T_{25}, t)$. (T'_{25}, t) and (T_{25}, t) are points belonging to the interval $[(\hat{k}_{24})^{(4)}, (\hat{M}_{24})^{(4)}]$. It is to be noted that $(a''_i)^{(4)}(T_{25}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{24})^{(4)} = 4$ then the function $(a''_i)^{(4)}(T_{25}, t)$, the FOURTH augmentation coefficient WOULD be absolutely continuous.

Definition of $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$:

(L) $(\hat{M}_{24})^{(4)}, (\hat{k}_{24})^{(4)}$, are positive constants

(M)
$$\frac{(a_i)^{(4)}}{(\hat{M}_{24})^{(4)}}, \frac{(b_i)^{(4)}}{(\hat{M}_{24})^{(4)}} < 1.$$

Definition of $(\hat{P}_{24})^{(4)}, (\hat{Q}_{24})^{(4)}$:

(N) There exists two constants $(\hat{P}_{24})^{(4)}$ and $(\hat{Q}_{24})^{(4)}$ which together with $(\hat{M}_{24})^{(4)}$, $(\hat{k}_{24})^{(4)}$, $(\hat{A}_{24})^{(4)}$ and $(\hat{B}_{24})^{(4)}$ and the constants $(a_i)^{(4)}$, $(a'_i)^{(4)}$, $(b_i)^{(4)}$, $(b'_i)^{(4)}$, $(p_i)^{(4)}$, $(r_i)^{(4)}$, $i = 24, 25, 26$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(a_i)^{(4)} + (a'_i)^{(4)} + (\hat{A}_{24})^{(4)} + (\hat{P}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1$$

$$\frac{1}{(\hat{M}_{24})^{(4)}} [(b_i)^{(4)} + (b'_i)^{(4)} + (\hat{B}_{24})^{(4)} + (\hat{Q}_{24})^{(4)} (\hat{k}_{24})^{(4)}] < 1.$$

Where we suppose,

(O) $(a_i)^{(5)}$, $(a'_i)^{(5)}$, $(a''_i)^{(5)}$, $(b_i)^{(5)}$, $(b'_i)^{(5)}$, $(b''_i)^{(5)} > 0$, $i, j = 28, 29, 30$

(P) The functions $(a''_i)^{(5)}$, $(b''_i)^{(5)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(5)}$, $(r_i)^{(5)}$:

$$(a''_i)^{(5)}(T_{29}, t) \leq (p_i)^{(5)} \leq (\hat{A}_{28})^{(5)}$$

$$(b''_i)^{(5)}(G_{31}, t) \leq (r_i)^{(5)} \leq (b'_i)^{(5)} \leq (\hat{B}_{28})^{(5)}.$$

$$(Q) \lim_{T_2 \rightarrow \infty} (a''_i)^{(5)}(T_{29}, t) = (p_i)^{(5)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(5)}(G_{31}, t) = (r_i)^{(5)}$$

Definition of $(\hat{A}_{28})^{(5)}$, $(\hat{B}_{28})^{(5)}$:

Where $(\hat{A}_{28})^{(5)}$, $(\hat{B}_{28})^{(5)}$, $(p_i)^{(5)}$, $(r_i)^{(5)}$ are positive constants and $i = 28, 29, 30$.

They satisfy Lipschitz condition:

$$|(a''_i)^{(5)}(T'_{29}, t) - (a''_i)^{(5)}(T_{29}, t)| \leq (\hat{k}_{28})^{(5)} |T'_{29} - T_{29}| e^{-(\hat{M}_{28})^{(5)}t}$$

$$|(b''_i)^{(5)}(G'_{31}, t) - (b''_i)^{(5)}(G_{31}, t)| < (\hat{k}_{28})^{(5)} |(G'_{31}) - (G_{31})| e^{-(\hat{M}_{28})^{(5)}t}.$$

With the Lipschitz condition, we place a restriction on the behavior of functions $(a''_i)^{(5)}(T'_{29}, t)$ and $(a''_i)^{(5)}(T_{29}, t)$. (T'_{29}, t) and (T_{29}, t) are points belonging to the interval $[(\hat{k}_{28})^{(5)}, (\hat{M}_{28})^{(5)}]$. It is to be noted that $(a''_i)^{(5)}(T_{29}, t)$ is uniformly continuous. In the eventuality of the fact, that if $(\hat{M}_{28})^{(5)} = 5$ then the function $(a''_i)^{(5)}(T_{29}, t)$, the **FIFTH augmentation coefficient** attributable would be absolutely continuous. .

Definition of $(\hat{M}_{28})^{(5)}$, $(\hat{k}_{28})^{(5)}$:

(R) $(\hat{M}_{28})^{(5)}$, $(\hat{k}_{28})^{(5)}$, are positive constants

$$\frac{(a_i)^{(5)}}{(\hat{M}_{28})^{(5)}} , \frac{(b_i)^{(5)}}{(\hat{M}_{28})^{(5)}} < 1.$$

Definition of $(\hat{P}_{28})^{(5)}$, $(\hat{Q}_{28})^{(5)}$:

(S) There exists two constants $(\hat{P}_{28})^{(5)}$ and $(\hat{Q}_{28})^{(5)}$ which together with $(\hat{M}_{28})^{(5)}$, $(\hat{k}_{28})^{(5)}$, $(\hat{A}_{28})^{(5)}$ and $(\hat{B}_{28})^{(5)}$ and the constants $(a_i)^{(5)}$, $(a'_i)^{(5)}$, $(b_i)^{(5)}$, $(b'_i)^{(5)}$, $(p_i)^{(5)}$, $(r_i)^{(5)}$, $i = 28, 29, 30$, satisfy the inequalities

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(a_i)^{(5)} + (a'_i)^{(5)} + (\hat{A}_{28})^{(5)} + (\hat{P}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1$$

$$\frac{1}{(\hat{M}_{28})^{(5)}} [(b_i)^{(5)} + (b'_i)^{(5)} + (\hat{B}_{28})^{(5)} + (\hat{Q}_{28})^{(5)} (\hat{k}_{28})^{(5)}] < 1.$$

Where we suppose.

$(a_i)^{(6)}$, $(a'_i)^{(6)}$, $(a''_i)^{(6)}$, $(b_i)^{(6)}$, $(b'_i)^{(6)}$, $(b''_i)^{(6)} > 0$, $i, j = 32, 33, 34$

(T) The functions $(a''_i)^{(6)}$, $(b''_i)^{(6)}$ are positive continuous increasing and bounded.

Definition of $(p_i)^{(6)}$, $(r_i)^{(6)}$:

$$(a''_i)^{(6)}(T_{33}, t) \leq (p_i)^{(6)} \leq (\hat{A}_{32})^{(6)}$$

$$(b''_i)^{(6)}(G_{35}, t) \leq (r_i)^{(6)} \leq (b'_i)^{(6)} \leq (\hat{B}_{32})^{(6)}.$$

$$(U) \lim_{T_2 \rightarrow \infty} (a''_i)^{(6)}(T_{33}, t) = (p_i)^{(6)}$$

$$\lim_{G \rightarrow \infty} (b''_i)^{(6)}(G_{35}, t) = (r_i)^{(6)}$$

Definition of $(\hat{A}_{32})^{(6)}$, $(\hat{B}_{32})^{(6)}$:

Where $(\hat{A}_{32})^{(6)}$, $(\hat{B}_{32})^{(6)}$, $(p_i)^{(6)}$, $(r_i)^{(6)}$ are positive constants and $i = 32, 33, 34$.

They satisfy Lipschitz condition:

$$|(a''_i)^{(6)}(T'_{33}, t) - (a''_i)^{(6)}(T_{33}, t)| \leq (\hat{k}_{32})^{(6)} |T'_{33} - T_{33}| e^{-(\hat{M}_{32})^{(6)}t}$$

$$\bar{T}_{34}(t) = T_{34}^0 + \int_0^t \left[(b_{34})^{(6)} T_{33}(s_{(32)}) - \left((b'_{34})^{(6)} - (b''_{34})^{(6)} (G(s_{(32)}), s_{(32)}) \right) T_{34}(s_{(32)}) \right] ds_{(32)} .$$

Where $s_{(32)}$ is the integrand that is integrated over an interval $(0, t)$..

(a) The operator $\mathcal{A}^{(1)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{13}(t) \leq G_{13}^0 + \int_0^t \left[(a_{13})^{(1)} \left(G_{14}^0 + (\hat{P}_{13})^{(1)} e^{(\hat{M}_{13})^{(1)}s_{(13)}} \right) \right] ds_{(13)} =$$

$$\left(1 + (a_{13})^{(1)}t \right) G_{14}^0 + \frac{(a_{13})^{(1)}(\hat{P}_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left(e^{(\hat{M}_{13})^{(1)}t} - 1 \right) .$$

From which it follows that

$$(G_{13}(t) - G_{13}^0) e^{-(\hat{M}_{13})^{(1)}t} \leq \frac{(a_{13})^{(1)}}{(\hat{M}_{13})^{(1)}} \left[\left((\hat{P}_{13})^{(1)} + G_{14}^0 \right) e^{-\frac{(\hat{P}_{13})^{(1)} + G_{14}^0}{G_{14}^0}} + (\hat{P}_{13})^{(1)} \right]$$

(G_i^0) is as defined in the statement of theorem 1.

Analogous inequalities hold also for $G_{14}, G_{15}, T_{13}, T_{14}, T_{15}$.

The operator $\mathcal{A}^{(2)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that.

$$G_{16}(t) \leq G_{16}^0 + \int_0^t \left[(a_{16})^{(2)} \left(G_{17}^0 + (\hat{P}_{16})^{(2)} e^{(\hat{M}_{16})^{(2)}s_{(16)}} \right) \right] ds_{(16)} = \left(1 + (a_{16})^{(2)}t \right) G_{17}^0 + \frac{(a_{16})^{(2)}(\hat{P}_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left(e^{(\hat{M}_{16})^{(2)}t} - 1 \right) .$$

From which it follows that

$$(G_{16}(t) - G_{16}^0) e^{-(\hat{M}_{16})^{(2)}t} \leq \frac{(a_{16})^{(2)}}{(\hat{M}_{16})^{(2)}} \left[\left((\hat{P}_{16})^{(2)} + G_{17}^0 \right) e^{-\frac{(\hat{P}_{16})^{(2)} + G_{17}^0}{G_{17}^0}} + (\hat{P}_{16})^{(2)} \right]$$

Analogous inequalities hold also for $G_{17}, G_{18}, T_{16}, T_{17}, T_{18}$.

(a) The operator $\mathcal{A}^{(3)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{20}(t) \leq G_{20}^0 + \int_0^t \left[(a_{20})^{(3)} \left(G_{21}^0 + (\hat{P}_{20})^{(3)} e^{(\hat{M}_{20})^{(3)}s_{(20)}} \right) \right] ds_{(20)} =$$

$$\left(1 + (a_{20})^{(3)}t \right) G_{21}^0 + \frac{(a_{20})^{(3)}(\hat{P}_{20})^{(3)}}{(\hat{M}_{20})^{(3)}} \left(e^{(\hat{M}_{20})^{(3)}t} - 1 \right) .$$

From which it follows that

$$(G_{20}(t) - G_{20}^0) e^{-(\hat{M}_{20})^{(3)}t} \leq \frac{(a_{20})^{(3)}}{(\hat{M}_{20})^{(3)}} \left[\left((\hat{P}_{20})^{(3)} + G_{21}^0 \right) e^{-\frac{(\hat{P}_{20})^{(3)} + G_{21}^0}{G_{21}^0}} + (\hat{P}_{20})^{(3)} \right]$$

Analogous inequalities hold also for $G_{21}, G_{22}, T_{20}, T_{21}, T_{22}$.

(b) The operator $\mathcal{A}^{(4)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{24}(t) \leq G_{24}^0 + \int_0^t \left[(a_{24})^{(4)} \left(G_{25}^0 + (\hat{P}_{24})^{(4)} e^{(\hat{M}_{24})^{(4)}s_{(24)}} \right) \right] ds_{(24)} =$$

$$\left(1 + (a_{24})^{(4)}t \right) G_{25}^0 + \frac{(a_{24})^{(4)}(\hat{P}_{24})^{(4)}}{(\hat{M}_{24})^{(4)}} \left(e^{(\hat{M}_{24})^{(4)}t} - 1 \right) .$$

From which it follows that

$$(G_{24}(t) - G_{24}^0) e^{-(\hat{M}_{24})^{(4)}t} \leq \frac{(a_{24})^{(4)}}{(\hat{M}_{24})^{(4)}} \left[\left((\hat{P}_{24})^{(4)} + G_{25}^0 \right) e^{-\frac{(\hat{P}_{24})^{(4)} + G_{25}^0}{G_{25}^0}} + (\hat{P}_{24})^{(4)} \right]$$

(G_i^0) is as defined in the statement of theorem 1.

(c) The operator $\mathcal{A}^{(5)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{28}(t) \leq G_{28}^0 + \int_0^t \left[(a_{28})^{(5)} \left(G_{29}^0 + (\hat{P}_{28})^{(5)} e^{(\hat{M}_{28})^{(5)}s_{(28)}} \right) \right] ds_{(28)} =$$

$$\left(1 + (a_{28})^{(5)}t \right) G_{29}^0 + \frac{(a_{28})^{(5)}(\hat{P}_{28})^{(5)}}{(\hat{M}_{28})^{(5)}} \left(e^{(\hat{M}_{28})^{(5)}t} - 1 \right) .$$

From which it follows that

$$(G_{28}(t) - G_{28}^0) e^{-(\hat{M}_{28})^{(5)}t} \leq \frac{(a_{28})^{(5)}}{(\hat{M}_{28})^{(5)}} \left[\left((\hat{P}_{28})^{(5)} + G_{29}^0 \right) e^{-\frac{(\hat{P}_{28})^{(5)} + G_{29}^0}{G_{29}^0}} + (\hat{P}_{28})^{(5)} \right]$$

(G_i^0) is as defined in the statement of theorem 1.

(d) The operator $\mathcal{A}^{(6)}$ maps the space of functions satisfying GLOBAL EQUATIONS into itself .Indeed it is obvious that

$$G_{32}(t) \leq G_{32}^0 + \int_0^t \left[(a_{32})^{(6)} \left(G_{33}^0 + (\hat{P}_{32})^{(6)} e^{(\mathcal{M}_{32})^{(6)} s_{(32)}} \right) \right] ds_{(32)} =$$

$$\left(1 + (a_{32})^{(6)} t \right) G_{33}^0 + \frac{(a_{32})^{(6)} (\hat{P}_{32})^{(6)}}{(\mathcal{M}_{32})^{(6)}} \left(e^{(\mathcal{M}_{32})^{(6)} t} - 1 \right).$$

From which it follows that

$$(G_{32}(t) - G_{32}^0) e^{-(\mathcal{M}_{32})^{(6)} t} \leq \frac{(a_{32})^{(6)}}{(\mathcal{M}_{32})^{(6)}} \left[\left((\hat{P}_{32})^{(6)} + G_{33}^0 \right) e^{-\frac{(\hat{P}_{32})^{(6)} + G_{33}^0}{G_{33}^0}} + (\hat{P}_{32})^{(6)} \right]$$

(G_i^0) is as defined in the statement of theorem 6

Analogous inequalities hold also for $G_{25}, G_{26}, T_{24}, T_{25}, T_{26}$.

It is now sufficient to take $\frac{(a_i)^{(1)}}{(\mathcal{M}_{13})^{(1)}}, \frac{(b_i)^{(1)}}{(\mathcal{M}_{13})^{(1)}} < 1$ and to choose

$(\hat{P}_{13})^{(1)}$ and $(\hat{Q}_{13})^{(1)}$ large to have.

$$\frac{(a_i)^{(1)}}{(\mathcal{M}_{13})^{(1)}} \left[(\hat{P}_{13})^{(1)} + \left((\hat{P}_{13})^{(1)} + G_j^0 \right) e^{-\frac{(\hat{P}_{13})^{(1)} + G_j^0}{G_j^0}} \right] \leq (\hat{P}_{13})^{(1)}.$$

$$\frac{(b_i)^{(1)}}{(\mathcal{M}_{13})^{(1)}} \left[\left((\hat{Q}_{13})^{(1)} + T_j^0 \right) e^{-\frac{(\hat{Q}_{13})^{(1)} + T_j^0}{T_j^0}} + (\hat{Q}_{13})^{(1)} \right] \leq (\hat{Q}_{13})^{(1)}.$$

In order that the operator $\mathcal{A}^{(1)}$ transforms the space of sextuples of functions G_i, T_i satisfying GLOBAL EQUATIONS into itself.

The operator $\mathcal{A}^{(1)}$ is a contraction with respect to the metric

$$d \left((G^{(1)}, T^{(1)}), (G^{(2)}, T^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\mathcal{M}_{13})^{(1)} t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\mathcal{M}_{13})^{(1)} t} \right\}.$$

Indeed if we denote

Definition of \tilde{G}, \tilde{T} :

$$(\tilde{G}, \tilde{T}) = \mathcal{A}^{(1)}(G, T)$$

It results

$$|\tilde{G}_{13}^{(1)} - \tilde{G}_i^{(2)}| \leq \int_0^t (a_{13})^{(1)} |G_{14}^{(1)} - G_{14}^{(2)}| e^{-(\mathcal{M}_{13})^{(1)} s_{(13)}} e^{(\mathcal{M}_{13})^{(1)} s_{(13)}} ds_{(13)} +$$

$$\int_0^t \left\{ (a'_{13})^{(1)} |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\mathcal{M}_{13})^{(1)} s_{(13)}} e^{-(\mathcal{M}_{13})^{(1)} s_{(13)}} + \right.$$

$$(a''_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) |G_{13}^{(1)} - G_{13}^{(2)}| e^{-(\mathcal{M}_{13})^{(1)} s_{(13)}} e^{(\mathcal{M}_{13})^{(1)} s_{(13)}} +$$

$$\left. G_{13}^{(2)} |(a'_{13})^{(1)} (T_{14}^{(1)}, s_{(13)}) - (a'_{13})^{(1)} (T_{14}^{(2)}, s_{(13)})| e^{-(\mathcal{M}_{13})^{(1)} s_{(13)}} e^{(\mathcal{M}_{13})^{(1)} s_{(13)}} \right\} ds_{(13)}$$

Where $s_{(13)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$|G^{(1)} - G^{(2)}| e^{-(\mathcal{M}_{13})^{(1)} t} \leq \frac{1}{(\mathcal{M}_{13})^{(1)}} \left((a_{13})^{(1)} + (a'_{13})^{(1)} + (\hat{A}_{13})^{(1)} + (\hat{P}_{13})^{(1)} (\hat{k}_{13})^{(1)} \right) d \left((G^{(1)}, T^{(1)}); (G^{(2)}, T^{(2)}) \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows.

Remark 1: The fact that we supposed $(a'_{13})^{(1)}$ and $(b'_{13})^{(1)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\hat{P}_{13})^{(1)} e^{(\mathcal{M}_{13})^{(1)} t}$ and $(\hat{Q}_{13})^{(1)} e^{(\mathcal{M}_{13})^{(1)} t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(1)}$ and $(b''_i)^{(1)}, i = 13, 14, 15$ depend only on T_{14} and respectively on G (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \left\{ (a'_i)^{(1)} - (a''_i)^{(1)} (T_{14}(s_{(13)}), s_{(13)}) \right\} ds_{(13)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(1)} t} > 0 \text{ for } t > 0.$$

Definition of $(\widehat{\mathcal{M}}_{13})^{(1)}_1, (\widehat{\mathcal{M}}_{13})^{(1)}_2$ and $(\widehat{\mathcal{M}}_{13})^{(1)}_3$:

Remark 3: if G_{13} is bounded, the same property have also G_{14} and G_{15} . indeed if

$$G_{13} < (\widehat{\mathcal{M}}_{13})^{(1)} \text{ it follows } \frac{dG_{14}}{dt} \leq ((\widehat{\mathcal{M}}_{13})^{(1)})_1 - (a'_{14})^{(1)} G_{14} \text{ and by integrating}$$

$$G_{14} \leq ((\widehat{\mathcal{M}}_{13})^{(1)})_2 = G_{14}^0 + 2(a_{14})^{(1)} ((\widehat{\mathcal{M}}_{13})^{(1)})_1 / (a'_{14})^{(1)}$$

In the same way, one can obtain

$$G_{15} \leq ((\widehat{\mathcal{M}}_{13})^{(1)})_3 = G_{15}^0 + 2(a_{15})^{(1)} ((\widehat{\mathcal{M}}_{13})^{(1)})_2 / (a'_{15})^{(1)}$$

If G_{14} or G_{15} is bounded, the same property follows for G_{13}, G_{15} and G_{13}, G_{14} respectively..

Remark 4: If G_{13} is bounded, from below, the same property holds for G_{14} and G_{15} . The proof is analogous with the preceding one. An analogous property is true if G_{14} is bounded from below..

Remark 5: If T_{13} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(1)}(G(t), t)) = (b_{14}')^{(1)}$ then $T_{14} \rightarrow \infty$.

Definition of $(m)^{(1)}$ and ε_1 :

Indeed let t_1 be so that for $t > t_1$

$$(b_{14})^{(1)} - (b_i'')^{(1)}(G(t), t) < \varepsilon_1, T_{13}(t) > (m)^{(1)}.$$

Then $\frac{dT_{14}}{dt} \geq (a_{14})^{(1)}(m)^{(1)} - \varepsilon_1 T_{14}$ which leads to

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{\varepsilon_1} \right) (1 - e^{-\varepsilon_1 t}) + T_{14}^0 e^{-\varepsilon_1 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_1 t} = \frac{1}{2} \text{ it results}$$

$$T_{14} \geq \left(\frac{(a_{14})^{(1)}(m)^{(1)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_1} \text{ By taking now } \varepsilon_1 \text{ sufficiently small one sees that } T_{14} \text{ is unbounded. The same property}$$

holds for T_{15} if $\lim_{t \rightarrow \infty} (b_{15}'')^{(1)}(G(t), t) = (b_{15}')^{(1)}$

We now state a more precise theorem about the behaviors at infinity of the solutions .

It is now sufficient to take $\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}}, \frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} < 1$ and to choose

$(\hat{P}_{16})^{(2)}$ and $(\hat{Q}_{16})^{(2)}$ large to have.

$$\frac{(a_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[(\hat{P}_{16})^{(2)} + ((\hat{P}_{16})^{(2)} + G_j^0) e^{-\left(\frac{(\hat{P}_{16})^{(2)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{16})^{(2)}.$$

$$\frac{(b_i)^{(2)}}{(\bar{M}_{16})^{(2)}} \left[((\hat{Q}_{16})^{(2)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{16})^{(2)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{16})^{(2)} \right] \leq (\hat{Q}_{16})^{(2)}.$$

In order that the operator $\mathcal{A}^{(2)}$ transforms the space of sextuples of functions G_i, T_i satisfying .

The operator $\mathcal{A}^{(2)}$ is a contraction with respect to the metric

$$d \left(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\bar{M}_{16})^{(2)}t} \right\}.$$

Indeed if we denote

$$\text{Definition of } \widehat{G}_{19}, \widehat{T}_{19} : (\widehat{G}_{19}, \widehat{T}_{19}) = \mathcal{A}^{(2)}(G_{19}, T_{19}).$$

It results

$$\begin{aligned} |\widehat{G}_{16}^{(1)} - \widehat{G}_{16}^{(2)}| &\leq \int_0^t (a_{16})^{(2)} |G_{17}^{(1)} - G_{17}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} ds_{(16)} + \\ &\int_0^t \{ (a'_{16})^{(2)} |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{-(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &(a''_{16})^{(2)}(T_{17}^{(1)}, s_{(16)}) |G_{16}^{(1)} - G_{16}^{(2)}| e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} + \\ &G_{16}^{(2)} | (a''_{16})^{(2)}(T_{17}^{(1)}, s_{(16)}) - (a''_{16})^{(2)}(T_{17}^{(2)}, s_{(16)}) | e^{-(\bar{M}_{16})^{(2)}s_{(16)}} e^{(\bar{M}_{16})^{(2)}s_{(16)}} \} ds_{(16)}. \end{aligned}$$

Where $s_{(16)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$|(G_{19})^{(1)} - (G_{19})^{(2)}| e^{-(\bar{M}_{16})^{(2)}t} \leq$$

$$\frac{1}{(\bar{M}_{16})^{(2)}} \left((a_{16})^{(2)} + (a'_{16})^{(2)} + (\widehat{A}_{16})^{(2)} + (\widehat{P}_{16})^{(2)} (\widehat{K}_{16})^{(2)} \right) d \left(((G_{19})^{(1)}, (T_{19})^{(1)}), ((G_{19})^{(2)}, (T_{19})^{(2)}) \right).$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows.

Remark 1: The fact that we supposed $(a'_{16})^{(2)}$ and $(b''_{16})^{(2)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ and $(\widehat{Q}_{16})^{(2)} e^{(\bar{M}_{16})^{(2)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(2)}$ and $(b''_i)^{(2)}, i = 16, 17, 18$ depend only on T_{17} and respectively on (G_{19}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(2)} - (a''_i)^{(2)}(T_{17}(s_{(16)}), s_{(16)}) \} ds_{(16)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(2)}t} > 0 \text{ for } t > 0.$$

Definition of $(\widehat{M}_{16})^{(2)}_1, (\widehat{M}_{16})^{(2)}_2$ and $(\widehat{M}_{16})^{(2)}_3$:

Remark 3: if G_{16} is bounded, the same property have also G_{17} and G_{18} . indeed if

$$G_{16} < (\widehat{M}_{16})^{(2)} \text{ it follows } \frac{dG_{17}}{dt} \leq ((\widehat{M}_{16})^{(2)})_1 - (a'_{17})^{(2)} G_{17} \text{ and by integrating}$$

$$G_{17} \leq ((\widehat{M}_{16})^{(2)})_2 = G_{17}^0 + 2(a_{17})^{(2)} ((\widehat{M}_{16})^{(2)})_1 / (a'_{17})^{(2)}$$

In the same way , one can obtain

$$G_{18} \leq ((\widehat{M}_{16})^{(2)})_3 = G_{18}^0 + 2(a_{18})^{(2)} ((\widehat{M}_{16})^{(2)})_2 / (a'_{18})^{(2)}$$

If G_{17} or G_{18} is bounded, the same property follows for G_{16} , G_{18} and G_{16} , G_{17} respectively..

Remark 4: If G_{16} is bounded, from below, the same property holds for G_{17} and G_{18} . The proof is analogous with the preceding one. An analogous property is true if G_{17} is bounded from below..

Remark 5: If T_{16} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(2)}((G_{19})(t), t)) = (b_{17}')^{(2)}$ then $T_{17} \rightarrow \infty$.

Definition of $(m)^{(2)}$ and ε_2 :

Indeed let t_2 be so that for $t > t_2$

$$(b_{17})^{(2)} - (b_i'')^{(2)}((G_{19})(t), t) < \varepsilon_2, T_{16}(t) > (m)^{(2)}.$$

Then $\frac{dT_{17}}{dt} \geq (a_{17})^{(2)}(m)^{(2)} - \varepsilon_2 T_{17}$ which leads to

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{\varepsilon_2} \right) (1 - e^{-\varepsilon_2 t}) + T_{17}^0 e^{-\varepsilon_2 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_2 t} = \frac{1}{2} \text{ it results .}$$

$$T_{17} \geq \left(\frac{(a_{17})^{(2)}(m)^{(2)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_2} \text{ By taking now } \varepsilon_2 \text{ sufficiently small one sees that } T_{17} \text{ is unbounded. The same property}$$

holds for T_{18} if $\lim_{t \rightarrow \infty} ((b_{18}'')^{(2)}((G_{19})(t), t)) = (b_{18}')^{(2)}$

We now state a more precise theorem about the behaviors at infinity of the solutions .

It is now sufficient to take $\frac{(a_i)^{(3)}}{(M_{20})^{(3)}}, \frac{(b_i)^{(3)}}{(M_{20})^{(3)}} < 1$ and to choose

$(\hat{P}_{20})^{(3)}$ and $(\hat{Q}_{20})^{(3)}$ large to have.

$$\frac{(a_i)^{(3)}}{(M_{20})^{(3)}} \left[(\hat{P}_{20})^{(3)} + ((\hat{P}_{20})^{(3)} + G_j^0) e^{-\left(\frac{(\hat{P}_{20})^{(3)} + G_j^0}{G_j^0} \right)} \right] \leq (\hat{P}_{20})^{(3)}.$$

$$\frac{(b_i)^{(3)}}{(M_{20})^{(3)}} \left[((\hat{Q}_{20})^{(3)} + T_j^0) e^{-\left(\frac{(\hat{Q}_{20})^{(3)} + T_j^0}{T_j^0} \right)} + (\hat{Q}_{20})^{(3)} \right] \leq (\hat{Q}_{20})^{(3)}.$$

In order that the operator $\mathcal{A}^{(3)}$ transforms the space of sextuples of functions G_i, T_i into itself.

The operator $\mathcal{A}^{(3)}$ is a contraction with respect to the metric

$$d \left(((G_{23})^{(1)}, (T_{23})^{(1)}), ((G_{23})^{(2)}, (T_{23})^{(2)}) \right) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(M_{20})^{(3)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(M_{20})^{(3)}t} \}.$$

Indeed if we denote

$$\text{Definition of } \widehat{G}_{23}, \widehat{T}_{23} : ((\widehat{G}_{23}), (\widehat{T}_{23})) = \mathcal{A}^{(3)}((G_{23}), (T_{23})).$$

It results

$$\begin{aligned} |\widehat{G}_{20}^{(1)} - \widehat{G}_i^{(2)}| &\leq \int_0^t (a_{20})^{(3)} |G_{21}^{(1)} - G_{21}^{(2)}| e^{-(M_{20})^{(3)}s_{(20)}} e^{(M_{20})^{(3)}s_{(20)}} ds_{(20)} + \\ &\int_0^t \{ (a_{20}')^{(3)} |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(M_{20})^{(3)}s_{(20)}} e^{-(M_{20})^{(3)}s_{(20)}} + \\ &(a_{20}'')^{(3)} (T_{21}^{(1)}, s_{(20)}) |G_{20}^{(1)} - G_{20}^{(2)}| e^{-(M_{20})^{(3)}s_{(20)}} e^{(M_{20})^{(3)}s_{(20)}} + \\ &G_{20}^{(2)} | (a_{20}'')^{(3)} (T_{21}^{(1)}, s_{(20)}) - (a_{20}'')^{(3)} (T_{21}^{(2)}, s_{(20)}) | e^{-(M_{20})^{(3)}s_{(20)}} e^{(M_{20})^{(3)}s_{(20)}} \} ds_{(20)} \end{aligned}$$

Where $s_{(20)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$|G^{(1)} - G^{(2)}| e^{-(M_{20})^{(3)}t} \leq$$

$$\frac{1}{(M_{20})^{(3)}} ((a_{20})^{(3)} + (a_{20}')^{(3)} + (\widehat{A}_{20})^{(3)} + (\widehat{P}_{20})^{(3)} (\widehat{k}_{20})^{(3)}) d \left(((G_{23})^{(1)}, (T_{23})^{(1)}); (G_{23})^{(2)}, (T_{23})^{(2)}) \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows.

Remark 1: The fact that we supposed $(a_{20}'')^{(3)}$ and $(b_{20}'')^{(3)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{20})^{(3)} e^{(M_{20})^{(3)}t}$ and $(\widehat{Q}_{20})^{(3)} e^{(M_{20})^{(3)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(3)}$ and $(b_i'')^{(3)}, i = 20, 21, 22$ depend only on T_{21} and respectively on (G_{23}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a_i')^{(3)} - (a_i'')^{(3)} (T_{21}(s_{(20)}), s_{(20)}) \} ds_{(20)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(3)}t} > 0 \text{ for } t > 0.$$

Definition of $((\widehat{M}_{20})^{(3)})_1, ((\widehat{M}_{20})^{(3)})_2$ and $((\widehat{M}_{20})^{(3)})_3$:

Remark 3: if G_{20} is bounded, the same property have also G_{21} and G_{22} . indeed if

$$G_{20} < (\widehat{M}_{20})^{(3)} \text{ it follows } \frac{dG_{21}}{dt} \leq ((\widehat{M}_{20})^{(3)})_1 - (a_{21}')^{(3)} G_{21} \text{ and by integrating}$$

$$G_{21} \leq ((\widehat{M}_{20})^{(3)})_2 = G_{21}^0 + 2(a_{21})^{(3)} ((\widehat{M}_{20})^{(3)})_1 / (a_{21}')^{(3)}$$

In the same way , one can obtain

$$G_{22} \leq ((\widehat{M}_{20})^{(3)})_3 = G_{22}^0 + 2(a_{22})^{(3)}((\widehat{M}_{20})^{(3)})_2 / (a'_{22})^{(3)}$$

If G_{21} or G_{22} is bounded, the same property follows for G_{20} , G_{22} and G_{20} , G_{21} respectively..

Remark 4: If G_{20} is bounded, from below, the same property holds for G_{21} and G_{22} . The proof is analogous with the preceding one. An analogous property is true if G_{21} is bounded from below..

Remark 5: If T_{20} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(3)}((G_{23})(t), t)) = (b'_{21})^{(3)}$ then $T_{21} \rightarrow \infty$.

Definition of $(m)^{(3)}$ and ε_3 :

Indeed let t_3 be so that for $t > t_3$

$$(b_{21})^{(3)} - (b''_i)^{(3)}((G_{23})(t), t) < \varepsilon_3, T_{20}(t) > (m)^{(3)}.$$

Then $\frac{dT_{21}}{dt} \geq (a_{21})^{(3)}(m)^{(3)} - \varepsilon_3 T_{21}$ which leads to

$$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{\varepsilon_3} \right) (1 - e^{-\varepsilon_3 t}) + T_{21}^0 e^{-\varepsilon_3 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_3 t} = \frac{1}{2} \text{ it results}$$

$$T_{21} \geq \left(\frac{(a_{21})^{(3)}(m)^{(3)}}{2} \right), t = \log \frac{2}{\varepsilon_3} \text{ By taking now } \varepsilon_3 \text{ sufficiently small one sees that } T_{21} \text{ is unbounded. The same property}$$

holds for T_{22} if $\lim_{t \rightarrow \infty} (b''_{22})^{(3)}((G_{23})(t), t) = (b'_{22})^{(3)}$

We now state a more precise theorem about the behaviors at infinity of the solutions .

It is now sufficient to take $\frac{(a_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} , \frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} < 1$ and to choose

$(\widehat{P}_{24})^{(4)}$ and $(\widehat{Q}_{24})^{(4)}$ large to have.

$$\frac{(a_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[(\widehat{P}_{24})^{(4)} + ((\widehat{P}_{24})^{(4)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{24})^{(4)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{24})^{(4)}.$$

$$\frac{(b_i)^{(4)}}{(\widehat{M}_{24})^{(4)}} \left[((\widehat{Q}_{24})^{(4)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{24})^{(4)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{24})^{(4)} \right] \leq (\widehat{Q}_{24})^{(4)}.$$

In order that the operator $\mathcal{A}^{(4)}$ transforms the space of sextuples of functions G_i, T_i satisfying IN to itself.

The operator $\mathcal{A}^{(4)}$ is a contraction with respect to the metric

$$d((G_{27})^{(1)}, (T_{27})^{(1)}, (G_{27})^{(2)}, (T_{27})^{(2)}) =$$

$$\sup_i \{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{24})^{(4)}t} \}$$

Indeed if we denote

$$\text{Definition of } (\widehat{G}_{27}), (\widehat{T}_{27}) : ((\widehat{G}_{27}), (\widehat{T}_{27})) = \mathcal{A}^{(4)}((G_{27}), (T_{27}))$$

It results

$$\begin{aligned} |\widehat{G}_{24}^{(1)} - \widehat{G}_i^{(2)}| &\leq \int_0^t (a_{24})^{(4)} |G_{25}^{(1)} - G_{25}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s_{(24)}} e^{(\widehat{M}_{24})^{(4)}s_{(24)}} ds_{(24)} + \\ &\int_0^t \{ (a'_{24})^{(4)} |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s_{(24)}} e^{-(\widehat{M}_{24})^{(4)}s_{(24)}} + \\ &(a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) |G_{24}^{(1)} - G_{24}^{(2)}| e^{-(\widehat{M}_{24})^{(4)}s_{(24)}} e^{(\widehat{M}_{24})^{(4)}s_{(24)}} + \\ &G_{24}^{(2)} |(a''_{24})^{(4)} (T_{25}^{(1)}, s_{(24)}) - (a''_{24})^{(4)} (T_{25}^{(2)}, s_{(24)})| e^{-(\widehat{M}_{24})^{(4)}s_{(24)}} e^{(\widehat{M}_{24})^{(4)}s_{(24)}} \} ds_{(24)} \end{aligned}$$

Where $s_{(24)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$|(G_{27})^{(1)} - (G_{27})^{(2)}| e^{-(\widehat{M}_{24})^{(4)}t} \leq$$

$$\frac{1}{(\widehat{M}_{24})^{(4)}} ((a_{24})^{(4)} + (a'_{24})^{(4)} + (\widehat{A}_{24})^{(4)} + (\widehat{P}_{24})^{(4)} (\widehat{k}_{24})^{(4)}) d(((G_{27})^{(1)}, (T_{27})^{(1)}); (G_{27})^{(2)}, (T_{27})^{(2)})$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows.

Remark 1: The fact that we supposed $(a''_{24})^{(4)}$ and $(b''_{24})^{(4)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ and $(\widehat{Q}_{24})^{(4)} e^{(\widehat{M}_{24})^{(4)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(4)}$ and $(b''_i)^{(4)}$, $i = 24, 25, 26$ depend only on T_{25} and respectively on (G_{27}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 19 to 24 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{ (a'_i)^{(4)} - (a''_i)^{(4)} (T_{25}(s_{(24)}), s_{(24)}) \} ds_{(24)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b'_i)^{(4)}t} > 0 \text{ for } t > 0.$$

Definition of $((\widehat{M}_{24})^{(4)})_1, ((\widehat{M}_{24})^{(4)})_2$ and $((\widehat{M}_{24})^{(4)})_3$:

Remark 3: if G_{24} is bounded, the same property have also G_{25} and G_{26} . indeed if

$G_{24} < (\widehat{M}_{24})^{(4)}$ it follows $\frac{dG_{25}}{dt} \leq ((\widehat{M}_{24})^{(4)})_1 - (a'_{25})^{(4)}G_{25}$ and by integrating
 $G_{25} \leq ((\widehat{M}_{24})^{(4)})_2 = G_{25}^0 + 2(a_{25})^{(4)}((\widehat{M}_{24})^{(4)})_1 / (a'_{25})^{(4)}$

In the same way, one can obtain

$$G_{26} \leq ((\widehat{M}_{24})^{(4)})_3 = G_{26}^0 + 2(a_{26})^{(4)}((\widehat{M}_{24})^{(4)})_2 / (a'_{26})^{(4)}$$

If G_{25} or G_{26} is bounded, the same property follows for G_{24} , G_{26} and G_{24} , G_{25} respectively..

Remark 4: If G_{24} is bounded, from below, the same property holds for G_{25} and G_{26} . The proof is analogous with the preceding one. An analogous property is true if G_{25} is bounded from below..

Remark 5: If T_{24} is bounded from below and $\lim_{t \rightarrow \infty} ((b''_i)^{(4)}((G_{27})(t), t)) = (b'_{25})^{(4)}$ then $T_{25} \rightarrow \infty$.

Definition of $(m)^{(4)}$ and ε_4 :

Indeed let t_4 be so that for $t > t_4$

$$(b_{25})^{(4)} - (b''_i)^{(4)}((G_{27})(t), t) < \varepsilon_4, T_{24}(t) > (m)^{(4)} :$$

Then $\frac{dT_{25}}{dt} \geq (a_{25})^{(4)}(m)^{(4)} - \varepsilon_4 T_{25}$ which leads to

$$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{\varepsilon_4} \right) (1 - e^{-\varepsilon_4 t}) + T_{25}^0 e^{-\varepsilon_4 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_4 t} = \frac{1}{2} \text{ it results}$$

$T_{25} \geq \left(\frac{(a_{25})^{(4)}(m)^{(4)}}{2} \right)$, $t = \log \frac{2}{\varepsilon_4}$ By taking now ε_4 sufficiently small one sees that T_{25} is unbounded. The same property holds for T_{26} if $\lim_{t \rightarrow \infty} (b''_{26})^{(4)}((G_{27})(t), t) = (b'_{26})^{(4)}$

We now state a more precise theorem about the behaviors at infinity of the solutions ANALOGOUS inequalities hold also for $G_{29}, G_{30}, T_{28}, T_{29}, T_{30}$:

It is now sufficient to take $\frac{(a_i)^{(5)}}{(\widehat{M}_{28})^{(5)}}, \frac{(b_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} < 1$ and to choose $(\widehat{P}_{28})^{(5)}$ and $(\widehat{Q}_{28})^{(5)}$ large to have

$$\frac{(a_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[(\widehat{P}_{28})^{(5)} + ((\widehat{P}_{28})^{(5)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{28})^{(5)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{28})^{(5)} .$$

$$\frac{(b_i)^{(5)}}{(\widehat{M}_{28})^{(5)}} \left[((\widehat{Q}_{28})^{(5)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{28})^{(5)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{28})^{(5)} \right] \leq (\widehat{Q}_{28})^{(5)} .$$

In order that the operator $\mathcal{A}^{(5)}$ transforms the space of sextuples of functions G_i, T_i into itself.

The operator $\mathcal{A}^{(5)}$ is a contraction with respect to the metric

$$d \left(((G_{31})^{(1)}, (T_{31})^{(1)}), ((G_{31})^{(2)}, (T_{31})^{(2)}) \right) = \sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{28})^{(5)}t} \right\}$$

Indeed if we denote

$$\text{Definition of } (\widehat{G}_{31}), (\widehat{T}_{31}) : ((\widehat{G}_{31}), (\widehat{T}_{31})) = \mathcal{A}^{(5)}((G_{31}), (T_{31}))$$

It results

$$\begin{aligned} |\widehat{G}_{28}^{(1)} - \widehat{G}_i^{(2)}| &\leq \int_0^t (a_{28})^{(5)} |G_{29}^{(1)} - G_{29}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} ds_{(28)} + \\ &\int_0^t \{ (a'_{28})^{(5)} |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} + \\ &(a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) |G_{28}^{(1)} - G_{28}^{(2)}| e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} + \\ &G_{28}^{(2)} | (a''_{28})^{(5)} (T_{29}^{(1)}, s_{(28)}) - (a''_{28})^{(5)} (T_{29}^{(2)}, s_{(28)}) | e^{-(\widehat{M}_{28})^{(5)}s_{(28)}} e^{(\widehat{M}_{28})^{(5)}s_{(28)}} \} ds_{(28)} \end{aligned}$$

Where $s_{(28)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$\begin{aligned} |(G_{31})^{(1)} - (G_{31})^{(2)}| e^{-(\widehat{M}_{28})^{(5)}t} &\leq \\ \frac{1}{(\widehat{M}_{28})^{(5)}} & \left((a_{28})^{(5)} + (a'_{28})^{(5)} + (\widehat{A}_{28})^{(5)} + (\widehat{P}_{28})^{(5)} (\widehat{k}_{28})^{(5)} \right) d \left(((G_{31})^{(1)}, (T_{31})^{(1)}); (G_{31})^{(2)}, (T_{31})^{(2)} \right) \end{aligned}$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis (35,35,36) the result follows.

Remark 1: The fact that we supposed $(a''_{28})^{(5)}$ and $(b''_{28})^{(5)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis, in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ and $(\widehat{Q}_{28})^{(5)} e^{(\widehat{M}_{28})^{(5)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a''_i)^{(5)}$ and $(b''_i)^{(5)}$, $i = 28, 29, 30$ depend only on T_{29} and respectively on (G_{31}) (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From GLOBAL EQUATIONS it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(5)} - (a_i'')^{(5)}\} (T_{29}(s_{(28)}), s_{(28)}) ds_{(28)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(5)}t} > 0 \quad \text{for } t > 0.$$

Definition of $((\widehat{M}_{28})^{(5)})_1, ((\widehat{M}_{28})^{(5)})_2$ and $((\widehat{M}_{28})^{(5)})_3$:

Remark 3: if G_{28} is bounded, the same property have also G_{29} and G_{30} . indeed if

$G_{28} < ((\widehat{M}_{28})^{(5)})$ it follows $\frac{dG_{29}}{dt} \leq ((\widehat{M}_{28})^{(5)})_1 - (a_{29}')^{(5)}G_{29}$ and by integrating

$$G_{29} \leq ((\widehat{M}_{28})^{(5)})_2 = G_{29}^0 + 2(a_{29}')^{(5)}((\widehat{M}_{28})^{(5)})_1 / (a_{29}')^{(5)}$$

In the same way , one can obtain

$$G_{30} \leq ((\widehat{M}_{28})^{(5)})_3 = G_{30}^0 + 2(a_{30}')^{(5)}((\widehat{M}_{28})^{(5)})_2 / (a_{30}')^{(5)}$$

If G_{29} or G_{30} is bounded, the same property follows for G_{28} , G_{30} and G_{28} , G_{29} respectively..

Remark 4: If G_{28} is bounded, from below, the same property holds for G_{29} and G_{30} . The proof is analogous with the preceding one. An analogous property is true if G_{29} is bounded from below..

Remark 5: If T_{28} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(5)}((G_{31})(t), t)) = (b_{29}')^{(5)}$ then $T_{29} \rightarrow \infty$.

Definition of $(m)^{(5)}$ and ε_5 :

Indeed let t_5 be so that for $t > t_5$

$$(b_{29}')^{(5)} - (b_i'')^{(5)}((G_{31})(t), t) < \varepsilon_5, T_{28}(t) > (m)^{(5)}:$$

Then $\frac{dT_{29}}{dt} \geq (a_{29}')^{(5)}(m)^{(5)} - \varepsilon_5 T_{29}$ which leads to

$$T_{29} \geq \left(\frac{(a_{29}')^{(5)}(m)^{(5)}}{\varepsilon_5} \right) (1 - e^{-\varepsilon_5 t}) + T_{29}^0 e^{-\varepsilon_5 t} \quad \text{If we take } t \text{ such that } e^{-\varepsilon_5 t} = \frac{1}{2} \text{ it results}$$

$$T_{29} \geq \left(\frac{(a_{29}')^{(5)}(m)^{(5)}}{2} \right), \quad t = \log \frac{2}{\varepsilon_5} \quad \text{By taking now } \varepsilon_5 \text{ sufficiently small one sees that } T_{29} \text{ is unbounded. The same property}$$

holds for T_{30} if $\lim_{t \rightarrow \infty} (b_{30}'')^{(5)}((G_{31})(t), t) = (b_{30}')^{(5)}$

We now state a more precise theorem about the behaviors at infinity of the solutions

Analogous inequalities hold also for $G_{33}, G_{34}, T_{32}, T_{33}, T_{34}$:

It is now sufficient to take $\frac{(a_i)^{(6)}}{(\widehat{M}_{32})^{(6)}}, \frac{(b_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} < 1$ and to choose

$(\widehat{P}_{32})^{(6)}$ and $(\widehat{Q}_{32})^{(6)}$ large to have.

$$\frac{(a_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} \left[(\widehat{P}_{32})^{(6)} + ((\widehat{P}_{32})^{(6)} + G_j^0) e^{-\left(\frac{(\widehat{P}_{32})^{(6)} + G_j^0}{G_j^0} \right)} \right] \leq (\widehat{P}_{32})^{(6)} .$$

$$\frac{(b_i)^{(6)}}{(\widehat{M}_{32})^{(6)}} \left[((\widehat{Q}_{32})^{(6)} + T_j^0) e^{-\left(\frac{(\widehat{Q}_{32})^{(6)} + T_j^0}{T_j^0} \right)} + (\widehat{Q}_{32})^{(6)} \right] \leq (\widehat{Q}_{32})^{(6)} .$$

In order that the operator $\mathcal{A}^{(6)}$ transforms the space of sextuples of functions G_i, T_i into itself.

The operator $\mathcal{A}^{(6)}$ is a contraction with respect to the metric

$$d \left(((G_{35})^{(1)}, (T_{35})^{(1)}), ((G_{35})^{(2)}, (T_{35})^{(2)}) \right) =$$

$$\sup_i \left\{ \max_{t \in \mathbb{R}_+} |G_i^{(1)}(t) - G_i^{(2)}(t)| e^{-(\widehat{M}_{32})^{(6)}t}, \max_{t \in \mathbb{R}_+} |T_i^{(1)}(t) - T_i^{(2)}(t)| e^{-(\widehat{M}_{32})^{(6)}t} \right\}$$

Indeed if we denote

$$\text{Definition of } (\widehat{G}_{35}), (\widehat{T}_{35}) : ((\widehat{G}_{35}), (\widehat{T}_{35})) = \mathcal{A}^{(6)}((G_{35}), (T_{35}))$$

It results

$$\begin{aligned} |\widehat{G}_{32}^{(1)} - \widehat{G}_{32}^{(2)}| &\leq \int_0^t (a_{32})^{(6)} |G_{33}^{(1)} - G_{33}^{(2)}| e^{-(\widehat{M}_{32})^{(6)}s_{(32)}} e^{(\widehat{M}_{32})^{(6)}s_{(32)}} ds_{(32)} + \\ &\int_0^t \{(a_{32}')^{(6)} |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\widehat{M}_{32})^{(6)}s_{(32)}} e^{-(\widehat{M}_{32})^{(6)}s_{(32)}} + \\ &(a_{32}'')^{(6)}(T_{33}^{(1)}, s_{(32)}) |G_{32}^{(1)} - G_{32}^{(2)}| e^{-(\widehat{M}_{32})^{(6)}s_{(32)}} e^{(\widehat{M}_{32})^{(6)}s_{(32)}} + \\ &G_{32}^{(2)} |(a_{32}')^{(6)}(T_{33}^{(1)}, s_{(32)}) - (a_{32}')^{(6)}(T_{33}^{(2)}, s_{(32)})| e^{-(\widehat{M}_{32})^{(6)}s_{(32)}} e^{(\widehat{M}_{32})^{(6)}s_{(32)}}\} ds_{(32)} \end{aligned}$$

Where $s_{(32)}$ represents integrand that is integrated over the interval $[0, t]$

From the hypotheses it follows.

$$|(G_{35})^{(1)} - (G_{35})^{(2)}| e^{-(\widehat{M}_{32})^{(6)}t} \leq$$

$$\frac{1}{(\widehat{M}_{32})^{(6)}} ((a_{32})^{(6)} + (a_{32}')^{(6)} + (\widehat{A}_{32})^{(6)} + (\widehat{P}_{32})^{(6)} (\widehat{k}_{32})^{(6)}) d \left(((G_{35})^{(1)}, (T_{35})^{(1)}); (G_{35})^{(2)}, (T_{35})^{(2)} \right)$$

And analogous inequalities for G_i and T_i . Taking into account the hypothesis the result follows.

Remark 1: The fact that we supposed $(a_{32}'')^{(6)}$ and $(b_{32}'')^{(6)}$ depending also on t can be considered as not conformal with the reality, however we have put this hypothesis ,in order that we can postulate condition necessary to prove the uniqueness of the solution bounded by $(\widehat{P}_{32})^{(6)} e^{(\widehat{M}_{32})^{(6)}t}$ and $(\widehat{Q}_{32})^{(6)} e^{(\widehat{M}_{32})^{(6)}t}$ respectively of \mathbb{R}_+ .

If instead of proving the existence of the solution on \mathbb{R}_+ , we have to prove it only on a compact then it suffices to consider that $(a_i'')^{(6)}$ and $(b_i'')^{(6)}$, $i = 32, 33, 34$ depend only on T_{33} and respectively on $(G_{35})(t, t)$ (and not on t) and hypothesis can be replaced by a usual Lipschitz condition..

Remark 2: There does not exist any t where $G_i(t) = 0$ and $T_i(t) = 0$

From 69 to 32 it results

$$G_i(t) \geq G_i^0 e^{-\int_0^t \{(a_i')^{(6)} - (a_i'')^{(6)}(T_{33}(s_{(32)}), s_{(32)})\} ds_{(32)}} \geq 0$$

$$T_i(t) \geq T_i^0 e^{-(b_i')^{(6)}t} > 0 \text{ for } t > 0.$$

Definition of $((\widehat{M}_{32})^{(6)})_1, ((\widehat{M}_{32})^{(6)})_2$ and $((\widehat{M}_{32})^{(6)})_3$:

Remark 3: if G_{32} is bounded, the same property have also G_{33} and G_{34} . indeed if

$G_{32} < (\widehat{M}_{32})^{(6)}$ it follows $\frac{dG_{33}}{dt} \leq ((\widehat{M}_{32})^{(6)})_1 - (a_{33}')^{(6)}G_{33}$ and by integrating

$$G_{33} \leq ((\widehat{M}_{32})^{(6)})_2 = G_{33}^0 + 2(a_{33}')^{(6)}((\widehat{M}_{32})^{(6)})_1 / (a_{33}')^{(6)}$$

In the same way, one can obtain

$$G_{34} \leq ((\widehat{M}_{32})^{(6)})_3 = G_{34}^0 + 2(a_{34}')^{(6)}((\widehat{M}_{32})^{(6)})_2 / (a_{34}')^{(6)}$$

If G_{33} or G_{34} is bounded, the same property follows for G_{32} , G_{34} and G_{32} , G_{33} respectively..

Remark 4: If G_{32} is bounded, from below, the same property holds for G_{33} and G_{34} . The proof is analogous with the preceding one. An analogous property is true if G_{33} is bounded from below..

Remark 5: If T_{32} is bounded from below and $\lim_{t \rightarrow \infty} ((b_i'')^{(6)}((G_{35})(t), t)) = (b_{33}')^{(6)}$ then $T_{33} \rightarrow \infty$.

Definition of $(m)^{(6)}$ and ε_6 :

Indeed let t_6 be so that for $t > t_6$

$$(b_{33}')^{(6)} - (b_i'')^{(6)}((G_{35})(t), t) < \varepsilon_6, T_{32}(t) > (m)^{(6)} :$$

Then $\frac{dT_{33}}{dt} \geq (a_{33}')^{(6)}(m)^{(6)} - \varepsilon_6 T_{33}$ which leads to

$$T_{33} \geq \left(\frac{(a_{33}')^{(6)}(m)^{(6)}}{\varepsilon_6} \right) (1 - e^{-\varepsilon_6 t}) + T_{33}^0 e^{-\varepsilon_6 t} \text{ If we take } t \text{ such that } e^{-\varepsilon_6 t} = \frac{1}{2} \text{ it results}$$

$$T_{33} \geq \left(\frac{(a_{33}')^{(6)}(m)^{(6)}}{2} \right), t = \log \frac{2}{\varepsilon_6} \text{ By taking now } \varepsilon_6 \text{ sufficiently small one sees that } T_{33} \text{ is unbounded. The same property}$$

holds for T_{34} if $\lim_{t \rightarrow \infty} (b_{34}')^{(6)}((G_{35})(t), t(t), t) = (b_{34}')^{(6)}$

We now state a more precise theorem about the behaviors at infinity of the solutions.

Behavior of the solutions

If we denote and define

Definition of $(\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)}$:

- (a) $(\sigma_1)^{(1)}, (\sigma_2)^{(1)}, (\tau_1)^{(1)}, (\tau_2)^{(1)}$ four constants satisfying
 $-(\sigma_2)^{(1)} \leq -(a_{13}')^{(1)} + (a_{14}')^{(1)} - (a_{13}'')^{(1)}(T_{14}, t) + (a_{14}'')^{(1)}(T_{14}, t) \leq -(\sigma_1)^{(1)}$
 $-(\tau_2)^{(1)} \leq -(b_{13}')^{(1)} + (b_{14}')^{(1)} - (b_{13}'')^{(1)}(G, t) - (b_{14}'')^{(1)}(G, t) \leq -(\tau_1)^{(1)}$.

Definition of $(v_1)^{(1)}, (v_2)^{(1)}, (u_1)^{(1)}, (u_2)^{(1)}, v^{(1)}, u^{(1)}$:

By $(v_1)^{(1)} > 0, (v_2)^{(1)} < 0$ and respectively $(u_1)^{(1)} > 0, (u_2)^{(1)} < 0$ the roots of the equations $(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0$ and $(b_{14})^{(1)}(u^{(1)})^2 + (\tau_1)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$:

Definition of $(\bar{v}_1)^{(1)}, (\bar{v}_2)^{(1)}, (\bar{u}_1)^{(1)}, (\bar{u}_2)^{(1)}$:

By $(\bar{v}_1)^{(1)} > 0, (\bar{v}_2)^{(1)} < 0$ and respectively $(\bar{u}_1)^{(1)} > 0, (\bar{u}_2)^{(1)} < 0$ the roots of the equations $(a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} = 0$ and $(b_{14})^{(1)}(u^{(1)})^2 + (\tau_2)^{(1)}u^{(1)} - (b_{13})^{(1)} = 0$.

Definition of $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}, (v_0)^{(1)}$:-

- (b) If we define $(m_1)^{(1)}, (m_2)^{(1)}, (\mu_1)^{(1)}, (\mu_2)^{(1)}$ by
 $(m_2)^{(1)} = (v_0)^{(1)}, (m_1)^{(1)} = (v_1)^{(1)}$, if $(v_0)^{(1)} < (v_1)^{(1)}$
 $(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (\bar{v}_1)^{(1)}$, if $(v_1)^{(1)} < (v_0)^{(1)} < (\bar{v}_1)^{(1)}$,

$$\text{and } (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}$$

$$(m_2)^{(1)} = (v_1)^{(1)}, (m_1)^{(1)} = (v_0)^{(1)}, \text{ if } (\bar{v}_1)^{(1)} < (v_0)^{(1)} :$$

and analogously

$$(\mu_2)^{(1)} = (u_0)^{(1)}, (\mu_1)^{(1)} = (u_1)^{(1)}, \text{ if } (u_0)^{(1)} < (u_1)^{(1)}$$

$$(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (\bar{u}_1)^{(1)}, \text{ if } (u_1)^{(1)} < (u_0)^{(1)} < (\bar{u}_1)^{(1)},$$

$$\text{and } (u_0)^{(1)} = \frac{T_{13}^0}{T_{14}^0}$$

$$(\mu_2)^{(1)} = (u_1)^{(1)}, (\mu_1)^{(1)} = (u_0)^{(1)}, \text{ if } (\bar{u}_1)^{(1)} < (u_0)^{(1)} \text{ where } (u_1)^{(1)}, (\bar{u}_1)^{(1)}$$

are defined respectively.

Then the solution satisfies the inequalities

$$G_{13}^0 e^{((s_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{13}(t) \leq G_{13}^0 e^{(s_1)^{(1)}t}$$

where $(p_i)^{(1)}$ is defined

$$\frac{1}{(m_1)^{(1)}} G_{13}^0 e^{((S_1)^{(1)} - (p_{13})^{(1)})t} \leq G_{14}(t) \leq \frac{1}{(m_2)^{(1)}} G_{13}^0 e^{(S_1)^{(1)}t} .$$

$$\left(\frac{(a_{15})^{(1)} G_{13}^0}{(m_1)^{(1)}((S_1)^{(1)} - (p_{13})^{(1)} - (S_2)^{(1)})} \left[e^{((S_1)^{(1)} - (p_{13})^{(1)})t} - e^{-(S_2)^{(1)}t} \right] + G_{15}^0 e^{-(S_2)^{(1)}t} \leq G_{15}(t) \leq \frac{(a_{15})^{(1)} G_{13}^0}{(m_2)^{(1)}((S_1)^{(1)} - (a'_{15})^{(1)})} \left[e^{(S_1)^{(1)}t} - e^{-(a'_{15})^{(1)}t} \right] + G_{15}^0 e^{-(a'_{15})^{(1)}t} \right) .$$

$$\boxed{T_{13}^0 e^{(R_1)^{(1)}t} \leq T_{13}(t) \leq T_{13}^0 e^{((R_1)^{(1)} + (r_{13})^{(1)})t} .}$$

$$\frac{1}{(\mu_1)^{(1)}} T_{13}^0 e^{(R_1)^{(1)}t} \leq T_{13}(t) \leq \frac{1}{(\mu_2)^{(1)}} T_{13}^0 e^{((R_1)^{(1)} + (r_{13})^{(1)})t} .$$

$$\frac{(b_{15})^{(1)} T_{13}^0}{(\mu_1)^{(1)}((R_1)^{(1)} - (b'_{15})^{(1)})} \left[e^{(R_1)^{(1)}t} - e^{-(b'_{15})^{(1)}t} \right] + T_{15}^0 e^{-(b'_{15})^{(1)}t} \leq T_{15}(t) \leq \frac{(a_{15})^{(1)} T_{13}^0}{(\mu_2)^{(1)}((R_1)^{(1)} + (r_{13})^{(1)} + (R_2)^{(1)})} \left[e^{((R_1)^{(1)} + (r_{13})^{(1)})t} - e^{-(R_2)^{(1)}t} \right] + T_{15}^0 e^{-(R_2)^{(1)}t} .$$

Definition of $(S_1)^{(1)}, (S_2)^{(1)}, (R_1)^{(1)}, (R_2)^{(1)}$:-

Where $(S_1)^{(1)} = (a_{13})^{(1)}(m_2)^{(1)} - (a'_{13})^{(1)}$
 $(S_2)^{(1)} = (a_{15})^{(1)} - (p_{15})^{(1)}$
 $(R_1)^{(1)} = (b_{13})^{(1)}(\mu_2)^{(1)} - (b'_{13})^{(1)}$
 $(R_2)^{(1)} = (b'_{15})^{(1)} - (r_{15})^{(1)} .$

Behavior of the solutions

If we denote and define.

Definition of $(\sigma_1)^{(2)}, (\sigma_2)^{(2)}, (\tau_1)^{(2)}, (\tau_2)^{(2)}$:

$\sigma_1^{(2)}, (\sigma_2)^{(2)}, (\tau_1)^{(2)}, (\tau_2)^{(2)}$ four constants satisfying.
 $-(\sigma_2)^{(2)} \leq -(a'_{16})^{(2)} + (a'_{17})^{(2)} - (a''_{16})^{(2)}(T_{17}, t) + (a''_{17})^{(2)}(T_{17}, t) \leq -(\sigma_1)^{(2)} .$
 $-(\tau_2)^{(2)} \leq -(b'_{16})^{(2)} + (b'_{17})^{(2)} - (b''_{16})^{(2)}((G_{19}), t) - (b''_{17})^{(2)}((G_{19}), t) \leq -(\tau_1)^{(2)} .$

Definition of $(v_1)^{(2)}, (v_2)^{(2)}, (u_1)^{(2)}, (u_2)^{(2)}$:-

By $(v_1)^{(2)} > 0, (v_2)^{(2)} < 0$ and respectively $(u_1)^{(2)} > 0, (u_2)^{(2)} < 0$ the roots.

of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_1)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0 .$

and $(b_{14})^{(2)}(u^{(2)})^2 + (\tau_1)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0$ and.

Definition of $(\bar{v}_1)^{(2)}, (\bar{v}_2)^{(2)}, (\bar{u}_1)^{(2)}, (\bar{u}_2)^{(2)}$:-

By $(\bar{v}_1)^{(2)} > 0, (\bar{v}_2)^{(2)} < 0$ and respectively $(\bar{u}_1)^{(2)} > 0, (\bar{u}_2)^{(2)} < 0$ the

roots of the equations $(a_{17})^{(2)}(v^{(2)})^2 + (\sigma_2)^{(2)}v^{(2)} - (a_{16})^{(2)} = 0 .$

and $(b_{17})^{(2)}(u^{(2)})^2 + (\tau_2)^{(2)}u^{(2)} - (b_{16})^{(2)} = 0 .$

Definition of $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$:-

If we define $(m_1)^{(2)}, (m_2)^{(2)}, (\mu_1)^{(2)}, (\mu_2)^{(2)}$ by.

$(m_2)^{(2)} = (v_0)^{(2)}, (m_1)^{(2)} = (v_1)^{(2)}, \text{ if } (v_0)^{(2)} < (v_1)^{(2)} .$
 $(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (\bar{v}_1)^{(2)}, \text{ if } (v_1)^{(2)} < (v_0)^{(2)} < (\bar{v}_1)^{(2)},$

and $\boxed{(v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0}} .$

$(m_2)^{(2)} = (v_1)^{(2)}, (m_1)^{(2)} = (v_0)^{(2)}, \text{ if } (\bar{v}_1)^{(2)} < (v_0)^{(2)} .$

and analogously

$(\mu_2)^{(2)} = (u_0)^{(2)}, (\mu_1)^{(2)} = (u_1)^{(2)}, \text{ if } (u_0)^{(2)} < (u_1)^{(2)}$
 $(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (\bar{u}_1)^{(2)}, \text{ if } (u_1)^{(2)} < (u_0)^{(2)} < (\bar{u}_1)^{(2)},$

and $\boxed{(u_0)^{(2)} = \frac{T_{16}^0}{T_{17}^0}} .$

$(\mu_2)^{(2)} = (u_1)^{(2)}, (\mu_1)^{(2)} = (u_0)^{(2)}, \text{ if } (\bar{u}_1)^{(2)} < (u_0)^{(2)} .$

Then the solution satisfies the inequalities

$G_{16}^0 e^{(S_1)^{(2)} - (p_{16})^{(2)}t} \leq G_{16}(t) \leq G_{16}^0 e^{(S_1)^{(2)}t} .$

$(p_i)^{(2)}$ is defined.

$$\frac{1}{(m_1)^{(2)}} G_{16}^0 e^{((S_1)^{(2)} - (p_{16})^{(2)})t} \leq G_{17}(t) \leq \frac{1}{(m_2)^{(2)}} G_{16}^0 e^{(S_1)^{(2)}t} .$$

(l) If we define $(m_1)^{(6)}, (m_2)^{(6)}, (\mu_1)^{(6)}, (\mu_2)^{(6)}$ by

$$(m_2)^{(6)} = (v_0)^{(6)}, (m_1)^{(6)} = (v_1)^{(6)}, \text{ if } (v_0)^{(6)} < (v_1)^{(6)}$$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (\bar{v}_6)^{(6)}, \text{ if } (v_1)^{(6)} < (v_0)^{(6)} < (\bar{v}_1)^{(6)},$$

$$\text{and } \boxed{(v_0)^{(6)} = \frac{a_{32}^0}{a_{33}^0}}$$

$$(m_2)^{(6)} = (v_1)^{(6)}, (m_1)^{(6)} = (v_0)^{(6)}, \text{ if } (\bar{v}_1)^{(6)} < (v_0)^{(6)}$$

and analogously

$$(\mu_2)^{(6)} = (u_0)^{(6)}, (\mu_1)^{(6)} = (u_1)^{(6)}, \text{ if } (u_0)^{(6)} < (u_1)^{(6)}$$

$$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (\bar{u}_1)^{(6)}, \text{ if } (u_1)^{(6)} < (u_0)^{(6)} < (\bar{u}_1)^{(6)},$$

$$\text{and } \boxed{(u_0)^{(6)} = \frac{T_{32}^0}{T_{33}^0}}$$

$$(\mu_2)^{(6)} = (u_1)^{(6)}, (\mu_1)^{(6)} = (u_0)^{(6)}, \text{ if } (\bar{u}_1)^{(6)} < (u_0)^{(6)} \text{ where } (u_1)^{(6)}, (\bar{u}_1)^{(6)}$$

are defined respectively

Then the solution satisfies the inequalities

$$G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{32}(t) \leq G_{32}^0 e^{(S_1)^{(6)}t}$$

where $(p_i)^{(6)}$ is defined.

$$\frac{1}{(m_1)^{(6)}} G_{32}^0 e^{((S_1)^{(6)} - (p_{32})^{(6)})t} \leq G_{33}(t) \leq \frac{1}{(m_2)^{(6)}} G_{32}^0 e^{(S_1)^{(6)}t}$$

$$\left(\frac{(a_{34})^{(6)} G_{32}^0}{(m_1)^{(6)} ((S_1)^{(6)} - (p_{32})^{(6)} - (S_2)^{(6)})} \left[e^{((S_1)^{(6)} - (p_{32})^{(6)})t} - e^{-(S_2)^{(6)}t} \right] + G_{34}^0 e^{-(S_2)^{(6)}t} \right) \leq G_{34}(t) \leq \frac{(a_{34})^{(6)} G_{32}^0}{(m_2)^{(6)} ((S_1)^{(6)} - (a_{34}')^{(6)})} \left[e^{(S_1)^{(6)}t} - e^{-(a_{34}')^{(6)}t} + G_{340} e^{-(a_{34}')^{(6)}t} \right]$$

$$\boxed{T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t}$$

$$\frac{1}{(\mu_1)^{(6)}} T_{32}^0 e^{(R_1)^{(6)}t} \leq T_{32}(t) \leq \frac{1}{(\mu_2)^{(6)}} T_{32}^0 e^{((R_1)^{(6)} + (r_{32})^{(6)})t}$$

$$\frac{(b_{34})^{(6)} T_{32}^0}{(\mu_1)^{(6)} ((R_1)^{(6)} - (b_{34})^{(6)})} \left[e^{(R_1)^{(6)}t} - e^{-(b_{34}')^{(6)}t} \right] + T_{34}^0 e^{-(b_{34}')^{(6)}t} \leq T_{34}(t) \leq$$

$$\frac{(a_{34})^{(6)} T_{32}^0}{(\mu_2)^{(6)} ((R_1)^{(6)} + (r_{32})^{(6)} + (R_2)^{(6)})} \left[e^{((R_1)^{(6)} + (r_{32})^{(6)})t} - e^{-(R_2)^{(6)}t} \right] + T_{34}^0 e^{-(R_2)^{(6)}t}$$

Definition of $(S_1)^{(6)}, (S_2)^{(6)}, (R_1)^{(6)}, (R_2)^{(6)}$:-

$$\text{Where } (S_1)^{(6)} = (a_{32})^{(6)}(m_2)^{(6)} - (a_{32}')^{(6)}$$

$$(S_2)^{(6)} = (a_{34})^{(6)} - (p_{34})^{(6)}$$

$$(R_1)^{(6)} = (b_{32})^{(6)}(\mu_2)^{(6)} - (b_{32}')^{(6)}$$

$$(R_2)^{(6)} = (b_{34}')^{(6)} - (r_{34})^{(6)}.$$

Proof : From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(1)}}{dt} = (a_{13})^{(1)} - \left((a_{13}')^{(1)} - (a_{14}')^{(1)} + (a_{13}'')^{(1)}(T_{14}, t) \right) - (a_{14}'')^{(1)}(T_{14}, t)v^{(1)} - (a_{14})^{(1)}v^{(1)}$$

Definition of $v^{(1)}$:- $\boxed{v^{(1)} = \frac{G_{13}}{G_{14}}}$

It follows

$$- \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_2)^{(1)}v^{(1)} - (a_{13})^{(1)} \right) \leq \frac{dv^{(1)}}{dt} \leq - \left((a_{14})^{(1)}(v^{(1)})^2 + (\sigma_1)^{(1)}v^{(1)} - (a_{13})^{(1)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(1)}, (v_0)^{(1)}$:-

(a) For $0 < \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}} < (v_1)^{(1)} < (\bar{v}_1)^{(1)}$

$$v^{(1)}(t) \geq \frac{(v_1)^{(1)} + (C)^{(1)}(v_2)^{(1)} e^{-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}t}}{1 + (C)^{(1)} e^{-(a_{14})^{(1)}(v_1)^{(1)} - (v_0)^{(1)}t}}, \quad \boxed{(C)^{(1)} = \frac{(v_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (v_2)^{(1)}}$$

it follows $(v_0)^{(1)} \leq v^{(1)}(t) \leq (v_1)^{(1)}$.

In the same manner , we get

$$v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)} (\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}} \quad , \quad \boxed{(\bar{C})^{(1)} = \frac{(\bar{v}_1)^{(1)} - (v_0)^{(1)}}{(v_0)^{(1)} - (\bar{v}_2)^{(1)}}$$

From which we deduce $(v_0)^{(1)} \leq v^{(1)}(t) \leq (\bar{v}_1)^{(1)}$

(b) If $0 < (v_1)^{(1)} < (v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0} < (\bar{v}_1)^{(1)}$ we find like in the previous case,

$$(v_1)^{(1)} \leq \frac{(v_1)^{(1)} + (\bar{C})^{(1)} (v_2)^{(1)} e^{[-(a_{14})^{(1)} ((v_1)^{(1)} - (v_2)^{(1)}) t]}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)} ((v_1)^{(1)} - (v_2)^{(1)}) t]}} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)} (\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}} \leq (\bar{v}_1)^{(1)} .$$

(c) If $0 < (v_1)^{(1)} \leq (\bar{v}_1)^{(1)} \leq \boxed{(v_0)^{(1)} = \frac{G_{13}^0}{G_{14}^0}}$, we obtain

$$(v_1)^{(1)} \leq v^{(1)}(t) \leq \frac{(\bar{v}_1)^{(1)} + (\bar{C})^{(1)} (\bar{v}_2)^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}}{1 + (\bar{C})^{(1)} e^{[-(a_{14})^{(1)} (\bar{v}_1)^{(1)} - (\bar{v}_2)^{(1)}] t}} \leq (v_0)^{(1)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(1)}(t)$:-

$$(m_2)^{(1)} \leq v^{(1)}(t) \leq (m_1)^{(1)}, \quad \boxed{v^{(1)}(t) = \frac{G_{13}(t)}{G_{14}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(1)}(t)$:-

$$(\mu_2)^{(1)} \leq u^{(1)}(t) \leq (\mu_1)^{(1)}, \quad \boxed{u^{(1)}(t) = \frac{T_{13}(t)}{T_{14}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{13}'')^{(1)} = (a_{14}'')^{(1)}$, then $(\sigma_1)^{(1)} = (\sigma_2)^{(1)}$ and in this case $(v_1)^{(1)} = (\bar{v}_1)^{(1)}$ if in addition $(v_0)^{(1)} = (v_1)^{(1)}$ then $v^{(1)}(t) = (v_0)^{(1)}$ and as a consequence $G_{13}(t) = (v_0)^{(1)} G_{14}(t)$ this also defines $(v_0)^{(1)}$ for the special case

Analogously if $(b_{13}'')^{(1)} = (b_{14}'')^{(1)}$, then $(\tau_1)^{(1)} = (\tau_2)^{(1)}$ and then

$(u_1)^{(1)} = (\bar{u}_1)^{(1)}$ if in addition $(u_0)^{(1)} = (u_1)^{(1)}$ then $T_{13}(t) = (u_0)^{(1)} T_{14}(t)$ This is an important consequence of the relation between $(v_1)^{(1)}$ and $(\bar{v}_1)^{(1)}$, and definition of $(u_0)^{(1)}$.

we obtain

$$\frac{dv^{(2)}}{dt} = (a_{16})^{(2)} - \left((a'_{16})^{(2)} - (a'_{17})^{(2)} + (a''_{16})^{(2)} (T_{17}, t) \right) - (a''_{17})^{(2)} (T_{17}, t) v^{(2)} - (a_{17})^{(2)} v^{(2)} .$$

Definition of $v^{(2)}$:- $\boxed{v^{(2)} = \frac{G_{16}}{G_{17}}}$

It follows

$$- \left((a_{17})^{(2)} (v^{(2)})^2 + (\sigma_2)^{(2)} v^{(2)} - (a_{16})^{(2)} \right) \leq \frac{dv^{(2)}}{dt} \leq - \left((a_{17})^{(2)} (v^{(2)})^2 + (\sigma_1)^{(2)} v^{(2)} - (a_{16})^{(2)} \right) .$$

From which one obtains

Definition of $(\bar{v}_1)^{(2)}, (v_0)^{(2)}$:-

(d) For $0 < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (v_1)^{(2)} < (\bar{v}_1)^{(2)}$

$$v^{(2)}(t) \geq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}((v_1)^{(2)} - (v_0)^{(2)})t]}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}((v_1)^{(2)} - (v_0)^{(2)})t]}} , \quad \boxed{(C)^{(2)} = \frac{(v_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (v_2)^{(2)}}$$

it follows $(v_0)^{(2)} \leq v^{(2)}(t) \leq (v_1)^{(2)}$.

In the same manner , we get

$$v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}} , \quad \boxed{(\bar{C})^{(2)} = \frac{(\bar{v}_1)^{(2)} - (v_0)^{(2)}}{(v_0)^{(2)} - (\bar{v}_2)^{(2)}}$$

From which we deduce $(v_0)^{(2)} \leq v^{(2)}(t) \leq (\bar{v}_1)^{(2)}$.

(e) If $0 < (v_1)^{(2)} < (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0} < (\bar{v}_1)^{(2)}$ we find like in the previous case,

$$(v_1)^{(2)} \leq \frac{(v_1)^{(2)} + (C)^{(2)}(v_2)^{(2)} e^{[-(a_{17})^{(2)}((v_1)^{(2)} - (v_2)^{(2)})t]}}{1 + (C)^{(2)} e^{[-(a_{17})^{(2)}((v_1)^{(2)} - (v_2)^{(2)})t]}} \leq v^{(2)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}} \leq (\bar{v}_1)^{(2)} .$$

(f) If $0 < (v_1)^{(2)} \leq (\bar{v}_1)^{(2)} \leq (v_0)^{(2)} = \frac{G_{16}^0}{G_{17}^0}$, we obtain

$$(v_1)^{(2)} \leq v^{(2)}(t) \leq \frac{(\bar{v}_1)^{(2)} + (\bar{C})^{(2)}(\bar{v}_2)^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}}{1 + (\bar{C})^{(2)} e^{[-(a_{17})^{(2)}((\bar{v}_1)^{(2)} - (\bar{v}_2)^{(2)})t]}} \leq (v_0)^{(2)}$$

And so with the notation of the first part of condition (c) , we have .

Definition of $v^{(2)}(t)$:-

$$(m_2)^{(2)} \leq v^{(2)}(t) \leq (m_1)^{(2)} , \quad \boxed{v^{(2)}(t) = \frac{G_{16}(t)}{G_{17}(t)}} .$$

In a completely analogous way, we obtain

Definition of $u^{(2)}(t)$:-

$$(\mu_2)^{(2)} \leq u^{(2)}(t) \leq (\mu_1)^{(2)} , \quad \boxed{u^{(2)}(t) = \frac{T_{16}(t)}{T_{17}(t)}} .$$

Particular case :

If $(a_{16}'')^{(2)} = (a_{17}'')^{(2)}$, then $(\sigma_1)^{(2)} = (\sigma_2)^{(2)}$ and in this case $(v_1)^{(2)} = (\bar{v}_1)^{(2)}$ if in addition $(v_0)^{(2)} = (v_1)^{(2)}$ then $v^{(2)}(t) = (v_0)^{(2)}$ and as a consequence $G_{16}(t) = (v_0)^{(2)} G_{17}(t)$

Analogously if $(b_{16}'')^{(2)} = (b_{17}'')^{(2)}$, then $(\tau_1)^{(2)} = (\tau_2)^{(2)}$ and then

$(u_1)^{(2)} = (\bar{u}_1)^{(2)}$ if in addition $(u_0)^{(2)} = (u_1)^{(2)}$ then $T_{16}(t) = (u_0)^{(2)} T_{17}(t)$ This is an important consequence of the relation between $(v_1)^{(2)}$ and $(\bar{v}_1)^{(2)}$.

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(3)}}{dt} = (a_{20})^{(3)} - \left((a_{20}')^{(3)} - (a_{21}')^{(3)} + (a_{20}'')^{(3)}(T_{21}, t) \right) - (a_{21}'')^{(3)}(T_{21}, t)v^{(3)} - (a_{21})^{(3)}v^{(3)} .$$

Definition of $v^{(3)}$:- $\boxed{v^{(3)} = \frac{G_{20}}{G_{21}}}$

It follows

$$-\left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_2)^{(3)}v^{(3)} - (a_{20})^{(3)}\right) \leq \frac{dv^{(3)}}{dt} \leq -\left((a_{21})^{(3)}(v^{(3)})^2 + (\sigma_1)^{(3)}v^{(3)} - (a_{20})^{(3)}\right).$$

From which one obtains

(a) For $0 < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (v_1)^{(3)} < (\bar{v}_1)^{(3)}$

$$v^{(3)}(t) \geq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_0)^{(3)})t]}} , \quad \boxed{(C)^{(3)} = \frac{(v_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (v_2)^{(3)}}}$$

it follows $(v_0)^{(3)} \leq v^{(3)}(t) \leq (v_1)^{(3)}$.

In the same manner, we get

$$v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} , \quad \boxed{(\bar{C})^{(3)} = \frac{(\bar{v}_1)^{(3)} - (v_0)^{(3)}}{(v_0)^{(3)} - (\bar{v}_2)^{(3)}}$$

Definition of $(\bar{v}_1)^{(3)}$:-

From which we deduce $(v_0)^{(3)} \leq v^{(3)}(t) \leq (\bar{v}_1)^{(3)}$.

(b) If $0 < (v_1)^{(3)} < (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0} < (\bar{v}_1)^{(3)}$ we find like in the previous case,

$$(v_1)^{(3)} \leq \frac{(v_1)^{(3)} + (C)^{(3)}(v_2)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}}{1 + (C)^{(3)} e^{[-(a_{21})^{(3)}((v_1)^{(3)} - (v_2)^{(3)})t]}} \leq v^{(3)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (\bar{v}_1)^{(3)}$$

(c) If $0 < (v_1)^{(3)} \leq (\bar{v}_1)^{(3)} \leq (v_0)^{(3)} = \frac{G_{20}^0}{G_{21}^0}$, we obtain

$$(v_1)^{(3)} \leq v^{(3)}(t) \leq \frac{(\bar{v}_1)^{(3)} + (\bar{C})^{(3)}(\bar{v}_2)^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}}{1 + (\bar{C})^{(3)} e^{[-(a_{21})^{(3)}((\bar{v}_1)^{(3)} - (\bar{v}_2)^{(3)})t]}} \leq (v_0)^{(3)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(3)}(t)$:-

$$(m_2)^{(3)} \leq v^{(3)}(t) \leq (m_1)^{(3)}, \quad \boxed{v^{(3)}(t) = \frac{G_{20}(t)}{G_{21}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(3)}(t)$:-

$$(\mu_2)^{(3)} \leq u^{(3)}(t) \leq (\mu_1)^{(3)}, \quad \boxed{u^{(3)}(t) = \frac{T_{20}(t)}{T_{21}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{20})^{(3)} = (a_{21})^{(3)}$, then $(\sigma_1)^{(3)} = (\sigma_2)^{(3)}$ and in this case $(v_1)^{(3)} = (\bar{v}_1)^{(3)}$ if in addition $(v_0)^{(3)} = (v_1)^{(3)}$ then $v^{(3)}(t) = (v_0)^{(3)}$ and as a consequence $G_{20}(t) = (v_0)^{(3)}G_{21}(t)$

Analogously if $(b_{20})^{(3)} = (b_{21})^{(3)}$, then $(\tau_1)^{(3)} = (\tau_2)^{(3)}$ and then

$(u_1)^{(3)} = (\bar{u}_1)^{(3)}$ if in addition $(u_0)^{(3)} = (u_1)^{(3)}$ then $T_{20}(t) = (u_0)^{(3)}T_{21}(t)$ This is an important consequence of the relation between $(v_1)^{(3)}$ and $(\bar{v}_1)^{(3)}$.

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(4)}}{dt} = (a_{24})^{(4)} - \left((a'_{24})^{(4)} - (a'_{25})^{(4)} + (a''_{24})^{(4)}(T_{25}, t) \right) - (a''_{25})^{(4)}(T_{25}, t)v^{(4)} - (a_{25})^{(4)}v^{(4)}$$

Definition of $v^{(4)}$:- $v^{(4)} = \frac{G_{24}}{G_{25}}$

It follows

$$- \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_2)^{(4)}v^{(4)} - (a_{24})^{(4)} \right) \leq \frac{dv^{(4)}}{dt} \leq - \left((a_{25})^{(4)}(v^{(4)})^2 + (\sigma_4)^{(4)}v^{(4)} - (a_{24})^{(4)} \right)$$

From which one obtains

Definition of $(v_1)^{(4)}, (v_0)^{(4)}$:-

(d) For $0 < \left[(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} \right] < (v_1)^{(4)} < (\bar{v}_1)^{(4)}$

$$v^{(4)}(t) \geq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}}{4 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_0)^{(4)})t]}} , \quad \left[(C)^{(4)} = \frac{(v_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (v_2)^{(4)}} \right]$$

it follows $(v_0)^{(4)} \leq v^{(4)}(t) \leq (v_1)^{(4)}$

In the same manner , we get

$$v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{4 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} , \quad \left[(\bar{C})^{(4)} = \frac{(\bar{v}_1)^{(4)} - (v_0)^{(4)}}{(v_0)^{(4)} - (\bar{v}_2)^{(4)}} \right]$$

From which we deduce $(v_0)^{(4)} \leq v^{(4)}(t) \leq (\bar{v}_1)^{(4)}$

(e) If $0 < (v_1)^{(4)} < (v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} < (\bar{v}_1)^{(4)}$ we find like in the previous case,

$$(v_1)^{(4)} \leq \frac{(v_1)^{(4)} + (C)^{(4)}(v_2)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}}{1 + (C)^{(4)} e^{[-(a_{25})^{(4)}((v_1)^{(4)} - (v_2)^{(4)})t]}} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (\bar{v}_1)^{(4)} .$$

(f) If $0 < (v_1)^{(4)} \leq (\bar{v}_1)^{(4)} \leq \left[(v_0)^{(4)} = \frac{G_{24}^0}{G_{25}^0} \right]$, we obtain

$$(v_1)^{(4)} \leq v^{(4)}(t) \leq \frac{(\bar{v}_1)^{(4)} + (\bar{C})^{(4)}(\bar{v}_2)^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}}{1 + (\bar{C})^{(4)} e^{[-(a_{25})^{(4)}((\bar{v}_1)^{(4)} - (\bar{v}_2)^{(4)})t]}} \leq (v_0)^{(4)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(4)}(t)$:-

$$(m_2)^{(4)} \leq v^{(4)}(t) \leq (m_1)^{(4)} , \quad \left[v^{(4)}(t) = \frac{G_{24}(t)}{G_{25}(t)} \right]$$

In a completely analogous way, we obtain

Definition of $u^{(4)}(t) :-$

$$(\mu_2)^{(4)} \leq u^{(4)}(t) \leq (\mu_1)^{(4)}, \quad \boxed{u^{(4)}(t) = \frac{T_{24}(t)}{T_{25}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{24})^{(4)} = (a''_{25})^{(4)}$, then $(\sigma_1)^{(4)} = (\sigma_2)^{(4)}$ and in this case $(v_1)^{(4)} = (\bar{v}_1)^{(4)}$ if in addition $(v_0)^{(4)} = (v_1)^{(4)}$ then $v^{(4)}(t) = (v_0)^{(4)}$ and as a consequence $G_{24}(t) = (v_0)^{(4)}G_{25}(t)$ **this also defines $(v_0)^{(4)}$ for the special case .**

Analogously if $(b''_{24})^{(4)} = (b''_{25})^{(4)}$, then $(\tau_1)^{(4)} = (\tau_2)^{(4)}$ and then

$(u_1)^{(4)} = (\bar{u}_4)^{(4)}$ if in addition $(u_0)^{(4)} = (u_1)^{(4)}$ then $T_{24}(t) = (u_0)^{(4)}T_{25}(t)$ This is an important consequence of the relation between $(v_1)^{(4)}$ and $(\bar{v}_1)^{(4)}$, **and definition of $(u_0)^{(4)}$.**

From GLOBAL EQUATIONS we obtain

$$\frac{dv^{(5)}}{dt} = (a_{28})^{(5)} - \left((a'_{28})^{(5)} - (a'_{29})^{(5)} + (a''_{28})^{(5)}(T_{29}, t) \right) - (a''_{29})^{(5)}(T_{29}, t)v^{(5)} - (a_{29})^{(5)}v^{(5)}$$

Definition of $v^{(5)} :-$ $\boxed{v^{(5)} = \frac{G_{28}}{G_{29}}}$

It follows

$$- \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_2)^{(5)}v^{(5)} - (a_{28})^{(5)} \right) \leq \frac{dv^{(5)}}{dt} \leq - \left((a_{29})^{(5)}(v^{(5)})^2 + (\sigma_1)^{(5)}v^{(5)} - (a_{28})^{(5)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(5)}, (v_0)^{(5)} :-$

(g) For $0 < \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}} < (v_1)^{(5)} < (\bar{v}_1)^{(5)}$

$$v^{(5)}(t) \geq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}{5 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_0)^{(5)}]t}}, \quad \boxed{(C)^{(5)} = \frac{(v_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (v_2)^{(5)}}$$

it follows $(v_0)^{(5)} \leq v^{(5)}(t) \leq (v_1)^{(5)}$

In the same manner , we get

$$v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{5 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}, \quad \boxed{(\bar{C})^{(5)} = \frac{(\bar{v}_1)^{(5)} - (v_0)^{(5)}}{(v_0)^{(5)} - (\bar{v}_2)^{(5)}}$$

From which we deduce $(v_0)^{(5)} \leq v^{(5)}(t) \leq (\bar{v}_5)^{(5)}$

(h) If $0 < (v_1)^{(5)} < (v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0} < (\bar{v}_1)^{(5)}$ we find like in the previous case,

$$(v_1)^{(5)} \leq \frac{(v_1)^{(5)} + (C)^{(5)}(v_2)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}(v_1)^{(5)} - (v_2)^{(5)}]t}} \leq v^{(5)}(t) \leq$$

$$\frac{(\bar{v}_1)^{(5)} + (\bar{C})^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}}{1 + (\bar{C})^{(5)} e^{[-(a_{29})^{(5)}(\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)}]t}} \leq (\bar{v}_1)^{(5)} .$$

(i) If $0 < (v_1)^{(5)} \leq (\bar{v}_1)^{(5)} \leq \boxed{(v_0)^{(5)} = \frac{G_{28}^0}{G_{29}^0}}$, we obtain

$$(v_1)^{(5)} \leq v^{(5)}(t) \leq \frac{(\bar{v}_1)^{(5)} + (C)^{(5)}(\bar{v}_2)^{(5)} e^{[-(a_{29})^{(5)}((\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)})t]}}{1 + (C)^{(5)} e^{[-(a_{29})^{(5)}((\bar{v}_1)^{(5)} - (\bar{v}_2)^{(5)})t]}} \leq (v_0)^{(5)}$$

And so with the notation of the first part of condition (c), we have

Definition of $v^{(5)}(t)$:-

$$(m_2)^{(5)} \leq v^{(5)}(t) \leq (m_1)^{(5)}, \quad \boxed{v^{(5)}(t) = \frac{G_{28}(t)}{G_{29}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(5)}(t)$:-

$$(\mu_2)^{(5)} \leq u^{(5)}(t) \leq (\mu_1)^{(5)}, \quad \boxed{u^{(5)}(t) = \frac{T_{28}(t)}{T_{29}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a''_{28})^{(5)} = (a''_{29})^{(5)}$, then $(\sigma_1)^{(5)} = (\sigma_2)^{(5)}$ and in this case $(v_1)^{(5)} = (\bar{v}_1)^{(5)}$ if in addition $(v_0)^{(5)} = (v_5)^{(5)}$ then $v^{(5)}(t) = (v_0)^{(5)}$ and as a consequence $G_{28}(t) = (v_0)^{(5)}G_{29}(t)$ **this also defines $(v_0)^{(5)}$ for the special case .**

Analogously if $(b''_{28})^{(5)} = (b''_{29})^{(5)}$, then $(\tau_1)^{(5)} = (\tau_2)^{(5)}$ and then

$(u_1)^{(5)} = (\bar{u}_1)^{(5)}$ if in addition $(u_0)^{(5)} = (u_1)^{(5)}$ then $T_{28}(t) = (u_0)^{(5)}T_{29}(t)$ This is an important consequence of the relation between $(v_1)^{(5)}$ and $(\bar{v}_1)^{(5)}$, **and definition of $(u_0)^{(5)}$.**

we obtain

$$\frac{dv^{(6)}}{dt} = (a_{32})^{(6)} - \left((a'_{32})^{(6)} - (a'_{33})^{(6)} + (a''_{32})^{(6)}(T_{33}, t) \right) - (a''_{33})^{(6)}(T_{33}, t)v^{(6)} - (a_{33})^{(6)}v^{(6)}$$

Definition of $v^{(6)}$:- $\boxed{v^{(6)} = \frac{G_{32}}{G_{33}}}$

It follows

$$- \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_2)^{(6)}v^{(6)} - (a_{32})^{(6)} \right) \leq \frac{dv^{(6)}}{dt} \leq - \left((a_{33})^{(6)}(v^{(6)})^2 + (\sigma_1)^{(6)}v^{(6)} - (a_{32})^{(6)} \right)$$

From which one obtains

Definition of $(\bar{v}_1)^{(6)}, (v_0)^{(6)}$:-

(j) For $0 < \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}} < (v_1)^{(6)} < (\bar{v}_1)^{(6)}$

$$v^{(6)}(t) \geq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_0)^{(6)})t]}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}((v_1)^{(6)} - (v_0)^{(6)})t]}} , \quad \boxed{(C)^{(6)} = \frac{(v_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (v_2)^{(6)}}$$

it follows $(v_0)^{(6)} \leq v^{(6)}(t) \leq (v_1)^{(6)}$

In the same manner , we get

$$v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} , \quad \boxed{(\bar{C})^{(6)} = \frac{(\bar{v}_1)^{(6)} - (v_0)^{(6)}}{(v_0)^{(6)} - (\bar{v}_2)^{(6)}}$$

From which we deduce $(v_0)^{(6)} \leq v^{(6)}(t) \leq (\bar{v}_1)^{(6)}$

(k) If $0 < (v_1)^{(6)} < (v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0} < (\bar{v}_1)^{(6)}$ we find like in the previous case,

$$(v_1)^{(6)} \leq \frac{(v_1)^{(6)} + (C)^{(6)}(v_2)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}}{1 + (C)^{(6)} e^{[-(a_{33})^{(6)}(v_1)^{(6)} - (v_2)^{(6)}]t}} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (\bar{v}_1)^{(6)} .$$

(l) If $0 < (v_1)^{(6)} \leq (\bar{v}_1)^{(6)} \leq \boxed{(v_0)^{(6)} = \frac{G_{32}^0}{G_{33}^0}}$, we obtain

$$(v_1)^{(6)} \leq v^{(6)}(t) \leq \frac{(\bar{v}_1)^{(6)} + (\bar{C})^{(6)}(\bar{v}_2)^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}}{1 + (\bar{C})^{(6)} e^{[-(a_{33})^{(6)}(\bar{v}_1)^{(6)} - (\bar{v}_2)^{(6)}]t}} \leq (v_0)^{(6)}$$

And so with the notation of the first part of condition (c) , we have

Definition of $v^{(6)}(t)$:-

$$(m_2)^{(6)} \leq v^{(6)}(t) \leq (m_1)^{(6)} , \quad \boxed{v^{(6)}(t) = \frac{G_{32}(t)}{G_{33}(t)}}$$

In a completely analogous way, we obtain

Definition of $u^{(6)}(t)$:-

$$(\mu_2)^{(6)} \leq u^{(6)}(t) \leq (\mu_1)^{(6)} , \quad \boxed{u^{(6)}(t) = \frac{T_{32}(t)}{T_{33}(t)}}$$

Now, using this result and replacing it in GLOBAL EQUATIONS we get easily the result stated in the theorem.

Particular case :

If $(a_{32}'')^{(6)} = (a_{33}'')^{(6)}$, then $(\sigma_1)^{(6)} = (\sigma_2)^{(6)}$ and in this case $(v_1)^{(6)} = (\bar{v}_1)^{(6)}$ if in addition $(v_0)^{(6)} = (v_1)^{(6)}$ then $v^{(6)}(t) = (v_0)^{(6)}$ and as a consequence $G_{32}(t) = (v_0)^{(6)}G_{33}(t)$ **this also defines $(v_0)^{(6)}$ for the special case .**

Analogously if $(b_{32}'')^{(6)} = (b_{33}'')^{(6)}$, then $(\tau_1)^{(6)} = (\tau_2)^{(6)}$ and then

$(u_1)^{(6)} = (\bar{u}_1)^{(6)}$ if in addition $(u_0)^{(6)} = (u_1)^{(6)}$ then $T_{32}(t) = (u_0)^{(6)}T_{33}(t)$ This is an important consequence of the relation between $(v_1)^{(6)}$ and $(\bar{v}_1)^{(6)}$, **and definition of $(u_0)^{(6)}$.**

We can prove the following

Theorem 3: If $(a_i'')^{(1)}$ and $(b_i'')^{(1)}$ are independent on t , and the conditions

$$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} < 0$$

$$(a'_{13})^{(1)}(a'_{14})^{(1)} - (a_{13})^{(1)}(a_{14})^{(1)} + (a_{13})^{(1)}(p_{13})^{(1)} + (a'_{14})^{(1)}(p_{14})^{(1)} + (p_{13})^{(1)}(p_{14})^{(1)} > 0$$

$$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} > 0 ,$$

$$(b'_{13})^{(1)}(b'_{14})^{(1)} - (b_{13})^{(1)}(b_{14})^{(1)} - (b'_{13})^{(1)}(r_{14})^{(1)} - (b'_{14})^{(1)}(r_{14})^{(1)} + (r_{13})^{(1)}(r_{14})^{(1)} < 0$$

with $(p_{13})^{(1)}, (r_{14})^{(1)}$ as defined, then the system.

If $(a_i'')^{(2)}$ and $(b_i'')^{(2)}$ are independent on t , and the conditions .

$$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} < 0 .$$

$$(a'_{16})^{(2)}(a'_{17})^{(2)} - (a_{16})^{(2)}(a_{17})^{(2)} + (a_{16})^{(2)}(p_{16})^{(2)} + (a'_{17})^{(2)}(p_{17})^{(2)} + (p_{16})^{(2)}(p_{17})^{(2)} > 0 .$$

$$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} > 0 , .$$

$$(b'_{16})^{(2)}(b'_{17})^{(2)} - (b_{16})^{(2)}(b_{17})^{(2)} - (b'_{16})^{(2)}(r_{17})^{(2)} - (b'_{17})^{(2)}(r_{17})^{(2)} + (r_{16})^{(2)}(r_{17})^{(2)} < 0$$

with $(p_{16})^{(2)}, (r_{17})^{(2)}$ as defined are satisfied , then the system.

If $(a_i'')^{(3)}$ and $(b_i'')^{(3)}$ are independent on t , and the conditions

$$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} < 0$$

$$(a'_{20})^{(3)}(a'_{21})^{(3)} - (a_{20})^{(3)}(a_{21})^{(3)} + (a_{20})^{(3)}(p_{20})^{(3)} + (a'_{21})^{(3)}(p_{21})^{(3)} + (p_{20})^{(3)}(p_{21})^{(3)} > 0$$

$$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} > 0 ,$$

$$(b'_{20})^{(3)}(b'_{21})^{(3)} - (b_{20})^{(3)}(b_{21})^{(3)} - (b'_{20})^{(3)}(r_{21})^{(3)} - (b'_{21})^{(3)}(r_{21})^{(3)} + (r_{20})^{(3)}(r_{21})^{(3)} < 0$$

with $(p_{20})^{(3)}, (r_{21})^{(3)}$ as defined are satisfied , then the system.

If $(a_i'')^{(4)}$ and $(b_i'')^{(4)}$ are independent on t , and the conditions

$$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} < 0$$

$$(a'_{24})^{(4)}(a'_{25})^{(4)} - (a_{24})^{(4)}(a_{25})^{(4)} + (a_{24})^{(4)}(p_{24})^{(4)} + (a'_{25})^{(4)}(p_{25})^{(4)} + (p_{24})^{(4)}(p_{25})^{(4)} > 0$$

$$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} > 0 ,$$

$$(b'_{24})^{(4)}(b'_{25})^{(4)} - (b_{24})^{(4)}(b_{25})^{(4)} - (b'_{24})^{(4)}(r_{25})^{(4)} - (b'_{25})^{(4)}(r_{25})^{(4)} + (r_{24})^{(4)}(r_{25})^{(4)} < 0$$

with $(p_{24})^{(4)}, (r_{25})^{(4)}$ as defined are satisfied , then the system.

If $(a_i'')^{(5)}$ and $(b_i'')^{(5)}$ are independent on t , and the conditions

$$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} < 0$$

$$(a'_{28})^{(5)}(a'_{29})^{(5)} - (a_{28})^{(5)}(a_{29})^{(5)} + (a_{28})^{(5)}(p_{28})^{(5)} + (a'_{29})^{(5)}(p_{29})^{(5)} + (p_{28})^{(5)}(p_{29})^{(5)} > 0$$

$$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} > 0 ,$$

$$(b'_{28})^{(5)}(b'_{29})^{(5)} - (b_{28})^{(5)}(b_{29})^{(5)} - (b'_{28})^{(5)}(r_{29})^{(5)} - (b'_{29})^{(5)}(r_{29})^{(5)} + (r_{28})^{(5)}(r_{29})^{(5)} < 0$$

with $(p_{28})^{(5)}, (r_{29})^{(5)}$ as defined satisfied , then the system.

If $(a_i'')^{(6)}$ and $(b_i'')^{(6)}$ are independent on t , and the conditions

$$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} < 0$$

$$(a'_{32})^{(6)}(a'_{33})^{(6)} - (a_{32})^{(6)}(a_{33})^{(6)} + (a_{32})^{(6)}(p_{32})^{(6)} + (a'_{33})^{(6)}(p_{33})^{(6)} + (p_{32})^{(6)}(p_{33})^{(6)} > 0$$

$$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} > 0 ,$$

$$(b'_{32})^{(6)}(b'_{33})^{(6)} - (b_{32})^{(6)}(b_{33})^{(6)} - (b'_{32})^{(6)}(r_{33})^{(6)} - (b'_{33})^{(6)}(r_{33})^{(6)} + (r_{32})^{(6)}(r_{33})^{(6)} < 0$$

with $(p_{32})^{(6)}, (r_{33})^{(6)}$ as defined are satisfied , then the system.

$$(a_{13})^{(1)}G_{14} - [(a'_{13})^{(1)} + (a''_{13})^{(1)}(T_{14})]G_{13} = 0 .$$

$$(a_{14})^{(1)}G_{13} - [(a'_{14})^{(1)} + (a''_{14})^{(1)}(T_{14})]G_{14} = 0 .$$

$$(a_{15})^{(1)}G_{14} - [(a'_{15})^{(1)} + (a''_{15})^{(1)}(T_{14})]G_{15} = 0 .$$

$$(b_{13})^{(1)}T_{14} - [(b'_{13})^{(1)} - (b''_{13})^{(1)}(G)]T_{13} = 0 .$$

$$(b_{14})^{(1)}T_{13} - [(b'_{14})^{(1)} - (b''_{14})^{(1)}(G)]T_{14} = 0 .$$

$$(b_{15})^{(1)}T_{14} - [(b'_{15})^{(1)} - (b''_{15})^{(1)}(G)]T_{15} = 0 .$$

has a unique positive solution , which is an equilibrium solution for the system.

$$(a_{16})^{(2)}G_{17} - [(a'_{16})^{(2)} + (a''_{16})^{(2)}(T_{17})]G_{16} = 0 .$$
